· Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Two Years at Gatun Locks.

Concrete laying at Gatun Locks was begun on August 24, 1909, and on August 24, 1911, there had been placed 1.548.790 cubic yards, leaving to be placed 451,210 cubic yards. An average of 2,183 cubic yards was laid per working day during the period August 24, 1909 to August 24, 1910, and an average of 2,911 cubic yards per working day during the period August 24, 1910 to August 24, 1911.

The work has been done by two plants, one consisting of eight 2-yard cube mixers, whose product is placed by four duplex cableways stretching across the lock site, and the other, of two 2-yard cube mixers, whose product is conveyed to place by construction railway. The cableway plant was not in full operation until January, 1910, although it began work on August 24, and the second plant began mixing concrete on December 27, 1909. The advance of the work from month to month is shown in the following statement:

MONTHS.	1909.	1910.	1911.
January	....	54,136	72,919
February	....	55,696	72,103
March	....	60,998	86,884
April	....	63,227	67,361
May	....	74,273	67,844
June	....	89,401	55,305
July	....	84,001	71,046
August	1,298	85,686	*52,805
September	12,294	76,720	....
October	29,378	86,949	....
November	30,270	75,152	....
December	42,832	80,212	....
Total	116,072	886,451	546,267

*August 1 to 24.

The amount of concrete placed each month will decrease steadily from this time forth, because the floor in all three locks is completed, and the second plant, which was largely engaged on the floor work, cannot be used to full capacity much longer. The walls in the upper and middle locks are practically completed, and the placing of concrete in large quantities is now confined to the lower locks, the walls of which are rapidly nearing completion. Three of the duplex cableways are working over the lower locks, the fourth having been withdrawn from concrete laying to handle iron and back fill at the upper locks. The distribution of concrete yet to be placed will be about, as follows:

	Cu. Yds.
Upper lock and forebay, including flare walls	16,926
Middle lock	32,897
Lower lock, including side flare walls and exclusive of center approach wall	326,035
Upper guide wall, center	32,766
Lower guide wall, center	42,586
Total	451,210

Armoring the West Breakwater, Colon.

The first barge load of rock for armoring the west breakwater, extending from Toro Point into Limon Bay, was brought from Porto Bello by the tug *Empire* on Wednesday, August 23. and has been dumped on the north side of the trestle fill, near its shore end. At the breakwater, the barges are towed into a small harbor, where the rock is unloaded by locomotive cranes upon Lidgerwood flat cars, which are run out upon the trestle, where the rock is ploughed off at the points desired. This method will give way, presently, to that of unloading by derrick barges, which will lift the rock from the scows, and place it upon the breakwater in one operation. Work on these derrick barges has been delayed by the tardiness of the contractors in the United States in the delivery of material.

The pieces of rock designed for armoring the breakwater will be broken, as far as possible, to size, and when the quarry is well opened up they will weigh as high as 15 tons. The rock is handled with "dogs," holes being bored into each piece to give the points a better purchase. In unloading onto the barges, the pieces of rock are deposited in order, so as to facilitate their unloading. The output as yet is small, only two barge loads having been received since the work began. This is mainly due, however, to the cleaning up of that part of the quarry where the selected rock is to be obtained.

The breakwater trestle now extends about 6,400 feet into the bay from the shore line.

Hydraulic Fill of Colon Completed.

The hydraulic fill of the city of Colon was completed on August 4, and dredge *No. 86*, which performed the greater part of the work, was withdrawn on that date, and placed in the drydock at Mount Hope for a general overhauling. The total amount of fill was 828,582 cubic yards. As the work advanced, it was found desirable to make the fill considerably higher in places than the established grade, in order to utilize the surplus in raising various low spots, which the discharge pipe of the dredge could not reach to advantage. It was possible to supply this extra fill, and, at the same time, to come within the limit of the amount to be expended, by reason of a lower yardage cost than was first estimated. All of the material was taken from Folks River, just east of the Mount Hope road, and this part of the bayou has been deepened to an average depth of about 30 feet.

The Colon fill was begun on November 5, 1910, by the dredge *Sandpiper*, which was exchanged on the 13th of that month for dredge *No. 86*. which was operated uninterruptedly until the completion of the work three months ago. The best monthly record made was that of July, 1911, when 124.949 cubic yards were placed. A report of the fill, by months, follows:

MONTH.	*Quantity. Cu. Yds.*
November 1 to 12, 1910, by *Sandpiper*	22,317
November 14 to 30, 1910, by dredge *No. 86*	43,970
December, 1910	97,731
January, 1911	112,841
February, 1911	70,826
March, 1911	84,948
April, 1911	92,361
May, 1911	76,501
June, 1911	97,149
July, 1911	124,949
August 1 to 4, 1911	4,989
Total	828,582

At the Atlantic Entrance.

The Canal has been extended to its full width at the Atlantic entrance as far inland as the old French canal, a distance from deep water of about five and a half miles, and there is a depth of at least 20 feet for the whole of this distance. The dipper dredge *Chagres* has rejoined the dredging fleet after extensive repairs in the Mount Hope drydock. A new boom and new bull wheel were put on, and all the machinery was given a thorough overhauling. This dredge is digging in rock, and excavating to the full depth of 41 feet. Ladder dredge *No. 1* has been taken to the drydock, where the hull will be repaired, the machinery overhauled, and the end of the ladder will be renewed. The tug *DeLesseps* has been sent to drydock, where its boiler will be replaced by one already used on the work, but in condition to stand the wear until the completion of the Canal. Within a few hundred yards of the dredges, near the French canal, two steam shovels are working in the pit at Mindi, excavating in the dry a quantity of rock and earth that still remains before the channel through the Mindi hills will be completed. One of the shovels is taking out the last of the soft earth at the north end of the pit, and when this work is completed, the greatest difficulty will be past. The other shovel is taking out rock at the north end. All the rock has been blasted. The spoil is hauled to Gatun, where it is needed in the back fill at the locks. Only two shovels are kept at work, because sufficient cars cannot be furnished to a greater number, the smallness of the pit, the heavy grade up which the trains must run to gain the natural level of the land, and the sloppy condition of the pit after each rain, making it unprofitable to expand the transportation service. The work here will be finished in about six months.

Between the place where the dredges are working, and the pit in which the shovels are

NOTES OF PROGRESS.

(Continued.)

digging, there are about 400,000 cubic yards of material to be excavated, mostly rock. No work is being done on this section at present, because removing material from it might cause a slide in the barrier that has been thrown up between the French canal and the steam shovel pit

Change in Telephone Service.

A contract has been entered into between the Panama Railroad Company, and the Isthmian Telephone Company, a local corporation organized for the purpose of conducting a general telephone business, including the operation of exchanges at Colon and Panama, by which the railroad company transfers its commercial toll line business in respect to calls originating at Colon or Panama, to the telephone company. For some time past, the railroad company has been furnishing unlimited toll line service to business houses in the cities of Colon and Panama at the fixed rate of $7.50 per month. This service will be discontinued on September 1, the date the new contract takes effect, and the telephone company will at once establish its toll line service, using the railroad company's through circuits, out of Panama, and Colon.

The message rate for the present will be 10 cents, United States currency, based upon a 3-minute conversation. All conversations beyond the 3-minute limit will be charged for at the rate of 10 cents for each additional 3-minute period. Under the contract, however, this rate may be changed upon mutual agreement. An all night service will be maintained.

The telephone company has an exchange in operation in Colon, equipped with a switchboard of Monarch make, and has obtained a concession for the establishment of another local exchange in the city of Panama, for which it has ordered a switchboard of the same type as at Colon. The contract does not include the Canal Zone in its scope, and the present arrangement of charging a subscriber, who wishes a telephone for commercial business, $7.50 per month for the service, will continue to obtain at all intermediate points. The exchanges of the railroad company will be connected into the exchanges of the telephone company by suitable trunking facilities, the cost of which will be borne by the telephone company. The contract also provides that official business shall take precedence over the business of the telephone company in the transmission of calls over the circuits set aside for the telephone company's use, should occasion arise.

A telephone pay station has been installed in the Hotel Tivoli. A new booth has been constructed and placed within the enclosure of the news stand in the hotel foyer. Guests of the hotel are charged for calls made from the rooms to points outside of the hotel. The following tariff rate has been adopted:

	Gold.
Panama, or Ancon	10c
Corozal exchange	20c
Empire exchange	20c
Gorgona exchange	25c
Gatun exchange	45c
Colon, or Cristobal	50c
Toro Point	50c

All calls are charged to the occupant of the room from which the call comes. Calls pertaining to official business of the Isthmian Canal Commission, or the Panama railroad, will be free. The system went into effect August 14.

A method of procedure has been approved for the installation of the operating machinery for the locks and spillways. The work of installation will be done under the Assistant Chief Engineer, and certain preliminary work by the construction divisions concerned. The method was devised by a committee, consisting of Edward Schildhauer of the Assistant Chief Engineer's force, John M. G. Watt of the Pacific Division, and Geo. M. Wells of the Atlantic Division.

CONCRETE WORK IN THE LOCKS.

About 63 per cent of the concrete for all the locks is in place, the amount at the close of the work on August 26, being 2,642,129 cubic yards, out of a total of approximately 4,199,400. A total of 34,289½ cubic yards of concrete was laid in the locks during the week ending August 26.

GATUN LOCKS.

Over 77 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on August 26, being 1,556,508 cubic yards. out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending August 26, and of the total, follows; and a similar statement for the work in the Spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers			Large stone.	Total.
	Concrete placed.	Hours worked.	No. of mixers	Concrete placed.	Hours worked.	No. of mixers

Previously reported								1,542,407½
Grand total								1,556,508

*The 544½ yards shown for the portable mixers are reinforced concrete, and were placed on the following days: August 21st, 87; August 22nd, 75½; August 23d, 100; August 24th, 99½; August 25th, 101½; August 26th, 81.

PEDRO MIGUEL LOCKS.

Concrete work in the locks at Pedro Miguel is over 85 per cent completed, 711,798 cubic yards, out of a total of 837,400, having been placed at the close of work on August 26. The record for each of the six 8-hour working days of last week, follows:

Date.	Auxiliary Plant.						Large stone.	Total.
	2-cubic yard mixers.			½-cubic yard mixer.				
	Concrete placed.	Hours worked.	No. of mixers	Concrete placed.	Hours worked.	No. of mixers

SOCIAL LIFE OF THE ZONE.

Women's Clubs.

There will be a meeting of the executive board of the Canal Zone Federation of Women's Clubs at Cristobal on Friday, September 8. According to the provisions of the revised by-laws, adopted at the annual meeting in April, the executive board is composed of the officers of the federation, the librarian, and the presidents of the federated clubs. Arrangements for the annual meeting to be held in January, 1912, will be made, and such special committees as are needful for the work will be appointed.

Church Notes.

The ceremony of blessing the parish house in connection with St. Ferdinand's Roman Catholic Church, Empire, was held on Sunday, August 20. Following the celebration of solemn high mass in the church at 9 a. m., a procession, formed of three priests, eight brothers of the Vincentian Order, and three Sisters of Charity of the same order, the children of the church, and members of the church societies, proceeded to the parish house, where the ceremony took place. The building, as remodeled, contains an assembly hall, three bedrooms, a priest's study, a refectory, kitchen, pantries, and servants' quarters. The Commission has contributed the furnishings throughout the living apartments, and the members of the congregation have placed such furniture as is necessary in the assembly hall. Social entertainments in connection with the opening of the house, were a meeting of the negro members of the congregation on Sunday afternoon, August 20, and a "smoker" held by the members of St. Ferdinand's Club on Wednesday evening, August 23. The two priests in charge have taken up residence in the parish house. All meetings of the church societies will be held in the assembly hall.

The members of the club of men and women connected with the Roman Catholic church in Las Cascadas, held a reception at the home of Mrs. W. W. Bowers on Saturday evening, August 19. The reception was a farewell to Mrs. Bowers, who is leaving Las Cascadas after a residence of four years.

Protestant Episcopal Missions.

The annual report of the Panama Mission of the Protestant Episcopal Church for the year ending June 30, shows that there are four priests in charge of the Canal Zone missions for Americans, with headquarters at Culebra, Ancon, Colon, and Empire. Two West Indian clergymen are in charge of missions at Gatun and Culebra. During the year, three priests resigned, and one was appointed to the hospital chapel at Ancon. Beside the priests, there are ten catechists. These men are West Indian negroes, and they are appointed by the General Missionary Board upon passing an examination. By their aid, with one deacon, the clergy are enabled to maintain regular weekly services in 15 missions, and to provide occasional services at other stations.

Owing to the progress of the Canal work, and the demolition of the villages of Tabernilla and San Pablo, the missions at those places have gone out of existence. Many of the former residents of the villages have removed to Pedro Miguel, and the organization of a mission there is projected as soon as funds for the erection of a church building can be raised.

The present missions for white congregations are located at Empire, Culebra, and Ancon. At Colon, Christ Church ministers to West Indians and Americans. Provision is made for regular services at Gatun and at Gorgona. Missions for West Indian negroes are located at Mount Hope, New Gatun, Bas Obispo, Gorgona, Las Cascadas, Empire, Culebra, Paraiso, and Panama. A rectory has been built at Gatun by the Church Missions building fund. There is an unorganized mission at Pleya del Flor, which is visited regularly by one of the priests. There are eight chapters of the Brotherhood of St. Andrew, with a total membership of 150. In connection with the churches in Colon, Empire, Culebra, and Ancon, there are altar guilds composed of American women.

New Salvation Army Institute.

The restaurant in the new Salvation Army institute at Cristobal was opened for business on Monday, August 28. The new institute. which was rebuilt by the Commission to take the place of the one destroyed in the fire of March 23, is situated on the Mount Hope road, about 500 feet south of the original site. It is two stories in height, 68 feet by 35½ feet, approximately of the same length, but considerably wider than the old building, thus materially increasing the amount of floor space.

The restaurant occupies the front room on the first floor, as formerly, but, on account of the increased width of the building, it has a much larger seating capacity. The counter, where the lunches are prepared. is on the right as one enters. As heretofore the custom, only light refreshments, consisting mainly of coffee, cocoa, sandwiches, and eggs in various styles, will be served. A small kitchen opens from the restaurant on the right, and another doorway leads into a reading room. From this room is an entrance to the dormitory, a large apartment occupying the entire rear of the first floor, capable of accommodating upward of 100 lodgers. It will be equipped with berths ranged along the sides of the room, and a night's lodging will be furnished, as formerly for 25 cents, or, in the case of the destitute, free. There are two outside entrances downstairs, one a front entrance for the use of the restaurant patrons, and the other, a side entrance for the lodgers.

There are seven rooms upstairs for the use of the commanding officer and his family, and assistants, one of which will be devoted to office purposes. All of the front rooms on the second floor open on a veranda. The Salvation Army on the Isthmus, of which Adjutant George Catlin is the divisional head, now comprises six corps—two at Colon, one each at Panama, Empire, Gorgona, and Gatun. He also has under his jurisdiction the corps at Bocas del Toro, and one at Port Limon, visiting both places four times a year.

Postal Business and Canal Zone Revenues.

During the month of July, the Canal Zone money order business amounted to $407,397.91 in orders issued, of which there were 16,669. The average value of orders issued was $24.44. Of the $407,397.91 in orders issued, $305,895.68 was payable in the United States, $100,969.73 in the Canal Zone, $372.50 in Martinique, and $160 in Costa Rica. The fees amounted to $1,811.04, and the amount paid and repaid was $120,906.35. Postal sales amounted to $6,010.79, and newspaper postage 20 cents.

Canal Zone revenues during the month of July were, as follows:

Distillation licenses	$475 21
Bicycle and chauffeur licenses	231.00
Motor vehicle licenses	188.00
Taxes, licenses, etc	8,489.04
Total	$9,383.25

PERSONAL.

Major Chester Harding, Major J. P Jervey, and Major T. C. Dickson, accompanied by their wives. sailed on the *Ancon* for the States on August 25 on annual leave of absence.

Convention of Postal Clerks.

The first annual meeting of the Canal Zone postal clerks will be held at Taboga Island on Labor Day, September 4. All post-offices will be closed the entire day, and official transportation will be issued to postmasters and clerks from their respective stations to Panama, and return, in order that they may attend the convention.

Tau Beta Pi.

All members of Tau Beta Pi, on the Isthmus, are requested to send their names to T. C. Morris, Gatun, C. Z.

Transfer of Odd Fellows Lodge.

The transfer of Canal Zone Lodge, No. 3, Independent Order of Odd Fellows from Culebra to Empire, will take place this week, and the first meeting in the new quarters will be held on Saturday evening. September 2. All members are requested to attend.

Moving the Washington Hotel.

The Washington Hotel at Colon was closed on August 19 for the purpose of moving it to another site, out of the way of the improvements in connection with the new hotel and grounds. It will be transferred to a vacant lot back of Christ church, near the Garfield House, and will have the same relative position as at present, with one end abutting on Bolivar street. The work of lifting the structure off its foundations and placing it on rollers is now in progress. Originally, the present building consisted of two stories, and was built about the year 1870. A third story was added about six years ago. It will be reopened for business upon its removal to the new location.

Rules for the guidance of employes in charge of oil-burning equipment have been printed in English, and will be printed in Spanish.

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Gatun, C Z., on Sunday, September 3, 1911, at 5 p. m. The program follows:

1. March—*Ideal*..........Reeves
2 Selection—*The Spring Maid*..........Reinhardt
3. Duet for cornet and baritone—*Miserere*....Verdi
Messrs. Sanmartin and Follman.
4. Overture—*Fest*..........Luetner
5. Waltz—*Casino Tanze*..........Gung'l
6. (*a*) Medley march—*Kiss Me Honey, Kiss Me*..........Snyder
(*b*) Two step—*Casey Jones*..........Newton
7. Reverie—*Silent Thought*..........Morrison
8. Medley selection—*Remick's Hits*..........Lampe
9. March—*The Arbitrator*..........Bagley

Chas. E. Jennings, *Musical Director*.

The next concert will be given at the Hotel Tivoli, on September 10, at 7.30 p. m.

FLAMENCO ISLAND GRAVES.

Removal of Remains of Sailors and Others Buried There.

Thirty-one graves of persons buried, from time to time, during the past 50 years on Flamenco, or Dead Man's Island, in Panama Bay, have recently been transferred to Ancon cemetery to make way for the fortification work. There were two cemetery plots, one on the northeast side of the high rock mass, which forms the greater part of the island, and another and larger plot on the west side, facing Naos Island. It is not known how many persons have been interred on the island, as it is probable, in view of the condition some of the tombstones and markers were in, that many others have long since disappeared, leaving unmarked graves. The greater part of the burials were of persons who died on board vessels en route to Panama, or while the vessels were at anchor in Panama Bay. Officers and sailors from the United States Navy, who fell victims to yellow fever, contributed a large percentage of the total number, and, in the case of the U. S. S. *Jamestown*, and that of the U. S. S. *Lancaster*, the loss was especially heavy.

Wolfred Nelson, in his book, "Five years in Panama," makes reference to the case of the U. S. S. *Jamestown*, but appears to have confounded it with that of the U. S. S. *Lancaster*, for he says"* * * * On the face of the island toward the city of Panama, one sees a handsome monument which was erected in memory of the officers and men of the United States ship *Jamestown*, who fell victims to yellow fever while anchored there in the year 1858. Eighty of her officers and crew were buried there. * * * * *" The monument in question was erected to those who died on board the U. S. S. *Lancaster* in 1861. There is a monument to the memory of a paymaster on the U. S. S. *Jamestown*, but the date given is 1867.

There were burials on the island up to 1911, the last being that of a man who was drowned at the Flamenco anchorage in December, 1910. In most cases, very little was found to indicate the presence of a grave; a few bones, generally the teeth, and, in one instance, a number of brass buttons were exhumed. These were placed in separate boxes, and reinterred in a place set aside for the purpose in Ancon cemetery, marked with their proper headstones and monuments. There were a number of Chinese buried on the island, but only two graves were removed, the transfer being made by members of that race. No body was permitted to be exhumed that had not been buried at least 18 months. The grave of a plague victim, who died in quarantine, a short time ago, was, therefore, left untouched.

The monuments, tombstones, or markers found intact, and their inscriptions are, as follows:

In small cemetery upon the hill.—Tall monument, inscribed on four sides, as follows: First side—"Lieut. J. Whipple Harris, born in New Hampshire, died August 24, 1861, aged 24 years." Second—"James McBride, Ireland, died August 12, 1861, aged 28; Stephen Mullins, Ireland, died August 18, 1861, aged 21; Francis McCabe, New York, died August 18, 1861, aged 27; Alfonso Worden, New York, died August 27, 1861, aged 28." Third—"The officers and crew attached to the U. S. S. *Lancaster*, flag officer, J. B. Montgomery, have just arrived in these seas, and erect this monument in memory of those who died and are buried here." Fourth—"John McCarthy, Ireland, died January 30, 1860, aged 25; Andrew Jackson, New York, died August 14, 1860, aged 27; Patrick Barry, Ireland, died August 10, 1861, aged 32; Henry C. Cummings, Pennsylvania, died August 12, 1861, aged 22."

Tombstone, inscribed "In memory of Sergeant William A. Corwin, U. S. Navy, died March 11, 1886, on board U. S. S. *Adams*, erected by his messmates."

Tombstone, inscribed "Michael Grady, aged 37; John Collier, aged 33."

Monument, inscribed "John Adams Bates, paymaster, died of yellow fever off Panama, on U. S. S. *Jamestown*, March 4, 1867, aged 29 years."

In large cemetery on west side of island.—Tombstone inscribed "Frida Volguardsen, born at Mazatlan, October 27, 1878, died on board *City of Panama*, March 19, 1879."

Tombstone, inscribed "George Hale, apothecary, U. S. S. *Tuscard*, aged 29, died March 18, 1873."

Tombstone inscribed "J. A. Mullin, died November 15, 1861, aged 26."

Tombstone, inscribed "Died in Panama, November 20, 1861, Alonzo James K., only child of James S. and Hannah Hermann, aged 3 months, 19 days," with epitaph reading "Who plucked this bud? The Master, the Gardener willeth but is silent."

Tombstone inscribed "In memory of Alex. H. Charles, master machinist, Naos Island, a native of Burast Island, Fifeshire, Scotland, died September 6, 1885, aged 29 years."

Tombstone, inscribed "LeRoy B Westfall, first officer steamship *J. L. Stephens*, died April 13, 1856, aged 43."

Tombstone, inscribed "S. L. Halladay, a native of Sydney, died December 14, 1867, aged 26."

Tombstone, inscribed "Commander Leonard Paulding, U. S. N., commander U. S. S. *Wateree*, died April 29, 1867."

Tombstone, inscribed "Mrs, Mary Kehoe, late Mrs. Mary Rosseter of Dublin, Ireland, born 1796, died April 29, 1860, erected by her only surviving children, George R. and John H. Rosseter."

Monument on the grave of the U. S. S. *Lancaster* officers, inscribed "William J. Whipple Harris, lieutenant, U. S. N., born at Portsmouth, July 5, 1837, died on board U. S. S. flagship *Lancaster*, in Panama Bay, August 24, 1861."

Tombstone, inscribed "I. L. Foster, died July 24, 1862, aged 5 years 6 months and 4 days. Willie P. Foster, died July 26, 1862, aged 3 years 10 months and 22 days; children of William and Mary J. Foster."

Tombstone, inscribed "John G. Hill, late chief engineer Pacific Steam Navigation Company's steamer *Quito*, died of yellow fever in Panama Bay, May 14, 1903. R. I. P."

Tombstone, inscribed Charles Henry Middleton, born June 12, 1806, died May 20, 1872."

Wooden cross, with the words, in Spanish, "Fallécio, Gregorio Carrasco, el 20 de Junio, 1910."

Tombstone, inscribed "Frederick Longworth Hodkinson, second engineer, P. S. N. S. S *Quito*, son of John Alfred, and Anne Hodkinson, England, June 8, 1886—March 1, 1909." He died of yellow fever en route to Panama from Guayaquil.

Monument, inscribed "Charles T. Cornell, aged 26, born at Kerry, Ireland, died May 15 1895. U. S. S. *Denver*."

Monument, inscribed "H. R. Barclay, chief engineer P. S. N. S. S. *South Carolina*, died August 30, 1883, aged 44."

Monument, inscribed "Bryan Ackland, aged 24, died at sea of yellow fever, 21st of December, 1909." This man was on his way up from Guayaquil, and died before the vessel he was on reached Panama.

Tombstone, inscribed in Spanish, "Fallécio, Eugenio Achaddea, 31 de Diciembre, 1910." This man was drowned off a hulk at the Flamenco Island anchorage.

Monument, inscribed "Andrew Blasykonski, purser, U. S. Navy, died May 4, 1902, aged 25."

Headstone, with only the initials "L. R. W." There was another headstone, which was broken. The only words remaining on it were "Died June 31, aged 32." There was still another broken stone, with the words "In memory of my beloved husband, Tobias Y. Burke of Maryland, born June 4, 1836; died November 6, 1888. D. B. S. A."

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 68 per cent completed, 152,764 cubic yards, out of a total of 225,000, having been placed at the close of work on August 26. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
August 21	200	15.00	2
August 22	172	12.00	2
August 23	200	16.00	2
August 24	184	15.00	2
August 25	188	14.00	2
August 26	120	12.00	2
Total	1,064	84.00	2
Previously reported	151,700		
Grand total	152,764		

Porto Bello Crusher.

A statement of the rock crushed at Porto Bello quarry during the week ending August 26, follows:

DATE.	Hours worked.	Cubic Yards.
August 21	2.32	1,155
August 22	2.05	754
August 23	2.55	947
August 24	3.25	1,190
August 25	3.35	1,897
August 26	5.12	1,981
	19.44	7,924

Resolutions of Respect and Sympathy.

The Pedro Miguel Masonic Club has adopted resolutions of respect in connection with the death of John C. Blair, a copy of which has been forwarded to Renovo Lodge, No. 495, Renovo, Pa., with which he was affiliated.

At the meeting of the Isthmian Canal Rebekah Lodge, No. 1, Gorgona, Independent Order of Odd Fellows, resolutions of sympathy were passed on the death of Mrs. Otis, the mother of Mr. Harry Otis of Gorgona.

At Culebra, on August 18, during a local rain storm, the wind reached a velocity of 38 miles an hour, blowing from the northeast. This is the second highest velocity recorded at this station, the highest being 39 miles an hour on July 20, 1910.

GATUN POWER PLANT.

Bids to be Asked for Hydroelectric Equipment for Permanent Use.

Bids will be advertised for in the near future for the following materials and equipment for the hydroelectric generating plant at the Spillway in Gatun Dam: Three water turbines, 2250 kilowatts each; 3 governors; 3 headgates; 3 penstocks; 3 compressed air regulators; 3 electric generators; 3 exciters; 2 motor-driven exciter sets; one lubricating system; one 20-ton traveling crane. The switchboard, cable control, and electric fixtures will be advertised for later.

The equipment is for the generating station that will furnish current for power to operate the gates, valves, and other machinery of the locks, the regulating works of the spillways of Gatun and Miraflores dams, and will furnish light for the same, as well as light and power along the Canal. Two proposals will be requested, one for a plant to be installed in the center of the Dam at the Spillway, and the other below the Dam at the Spillway, the advantage of the latter location being greater head. Water for both plants will be taken from Gatun Lake at the Spillway, where regulating gates will keep the maximum elevation as near 87 feet above sea level as possible, and where, at the end of the four months' dry season, the water may fall as low as 79 feet above sea level. From a concrete forebay in the Spillway dam, water will be carried in penstocks, equipped with headgates and compressed air regulators, or surge tanks, to the turbines.

For proposal No. 1, the average difference between the water levels in the lake and in the tailrace is estimated at 75 feet, and the turbines are rated on this basis, and are of the vertical type. For proposal No. 2, the turbines are to be rated upon the basis of an average difference of 83 feet in elevations. The topography in the vicinity of the lower end of the Spillway dam is suitable for either a vertical or horizontal type of turbine.

Turbines—The turbines will be of the unsubmerged, vertical shaft type, with not more than two runners per turbine, and with runners encased and in tandem; speed 300, 250, or 214.3 rotations per minute, whichever is best adapted to the design of turbine. Each will deliver 2250 kilowatts at the shaft when the average difference in water levels is 75 feet for proposal No. 1, and 83 feet for proposal No. 2. In operation, the turbine will be subject to instantaneous fluctuations of load equal to 50 per cent of the full rating. The runners are to be of cast iron, or steel plate, or a combination of both, designed to give the blades maximum rigidity and strength, arranged to permit easy removal from the case, to withstand all shock occasioned by water hammer, and an increase in speed of 100 per cent above normal. The outer casing will be of cast iron, or steel plate, and the inner casing of cast iron; and every facility for the inspection, repair, and removal of the runners will be provided. The shaft will be of forged nickel steel, preferably of hollow cross section, but alternative bids for a forged carbon steel shaft will be considered. The speed regulating gates will be of the balanced wicket type. A vertical thrust bearing of the hanging, ball, or roller type, is specified for the main bearing, but bids will also be considered for bearings of other types. Each turbine will be provided with quick acting, relay type governors, actuated either electrically or hydraulically, and of sufficient capacity for operating the gates smoothly, and in such time as will give the minimum variation in speed of the turbine. Each governor will be equipped with an auxiliary device for smoothly closing the gate in event of the failure of the governor to operate.

Headgates—One headgate will be required to close the opening to each penstock. It will be constructed entirely of iron and steel, will run in cast iron or steel guides, and be raised and lowered by means of a vertical stem, to which motion will be transmitted by a vertical, nonrising worm, driven by a 220-volt, 3-phase, 25-cycle induction motor. Each gate will be equipped with an auxiliary valve for the purpose of passing water slowly into the penstock after periods of shut down or disuse of the turbine, and it must be of size to fill the penstock in approximately five minutes. After the penstock is filled, the headgate will open automatically. In front of the gates will be a trash rack of bar iron to protect the gates, penstock, and turbine from damage by débris carried in the water.

Penstocks—The penstocks will be of the combination metal plate and concrete type, the metal being sufficiently strong to take the tension caused by the hydrostatic and impact pressures of the water, and the concrete, the external pressure of the back fill. The concrete will be placed by the Commission and forms no part of the contract. The inside diameter of the penstocks will not be less than 10 feet 6 inches, the plates of wrought iron or soft steel not less than 3-8 of an inch thick, and joined into a continuous tube from gates to turbines, either by riveting or by lockbar joints.

Compressed air regulators—The compressed air regulators, or surge tanks, are to be of the differential type, and will be located in the basement of the power house under the generator room. The complete equipment will consist of one regulator attached to each penstock, a common header connected to a compressed air tank, two air compressors, and the necessary auxiliaries. The function of the regulator, in addition to acting as a buffer for shocks, due to rejected loads, will be to assist the governor in adjusting the turbine speed. It will be constructed of steel plates, air tight, and will be riveted to the penstock through a tapering nozzle of proper proportions to give the best results in speed regulation.

Generators—The generators will be of the 3-phase alternator type, capacity 2500 k. v. a. (2000 k. w.) at 80 per cent power factor; poles, 10, 12, or 14; voltage (delta) 2200; current per phase, 656 amperes; frequency, 25 cycles per second; speed, 300, 250, or 214.3 rotations per minute. They will be of the vertical, water turbine type, with separately excited, revolving field; armatures, star connected, and the neutral load to be brought to the same terminal block as the phase loads. The characteristics of the generators shall be such that they may be operated in parallel, either with one another, or with the present installation of three 1500-k. v. a., 2200-volt, 1500-r. p. m., 25-cycle, star connected, steam turbine-driven alternators, situated at Miraflores, 40 miles distant, by transmission from Gatun Spillway. Owing to the starting and stopping of the many induction motors required in the operation of the several locks, the generators will be subjected to instantaneous fluctuations of an extreme nature, and must be designed to meet the conditions of an instantaneous variation of load equal to 50 per cent of the full load rating. An exciter generator of the direct current, shunt wound type, 50 kilowatts, 125 volts, 400 amperes, 300, 250, or 214.3 rotations per minute, vertical type, will be mounted directly upon the shaft of each generator.

Two motor-driven exciter sets of 100-k. w. capacity, a gravity type lubricating system with centrifugal pumps, and one 20-ton, 3-motor traveling crane, to be erected in the power house, form part of the contract.

Sewer and Water Connections in Colon and Panama.

President Arosemena of Panama has approved the agreement recently entered into with regard to the installation of water and sewer pipes in the cities of Colon and Panama, and has issued the following decree under date of July 21, 1911:

Article 1. The provisions contained in the regulations governing the installation of water and sewer connections in the cities of Panama and Colon are interpreted in the following manner:

"When involving original construction in which the Commission constructs or lays water mains or sewer mains along the streets in which permanent buildings exist, the Commission will construct at the same time lateral extensions from these water or sewer mains to the edge of the sidewalk of the street, for the purpose of providing facilities to the owners of those buildings in order that they may make therein the necessary installations and connections; this work of lateral extensions shall be collected as a part of the original work of the water and sewer mains, and paid by the Republic of Panama. When connections are made from the edge of the sidewalk to the buildings in question, their owners shall pay the cost of such work.

"If the original construction of the water and sewer mains is made by the Commission in any of those cities along streets in which there are no buildings at the time of bringing such work to conclusion, then those lateral extensions from the water and sewer mains to the edge of the sidewalk shall not be made by the Commission *unless* the Government of the Republic requests it officially, and its cost shall be paid in the form agreed upon between the Government of the Republic and the authorities of the Commission.

"In cases in which installation of plumbing must be made, and it is necessary to connect with the water or sewer mains in the cities of Panama and Colon, and where those laterals have not been laid, such installations shall be made, as follows: From the water or sewer main to the edge of the sidewalk by the Division of Public Works of the Department of Civil Administration of the Canal Zone; and from said edge up to and in the building by its owners through duly licensed plumbers, and the cost of the entire installation from the water or sewer main up to and in the building shall be paid by the owner of the same; all those installations in both cities shall be made in accordance with the provisions and regulations upon the subject which have been heretofore or may hereafter be promulgated."

Ancon Quarry.

A statement of the rock crushed at Ancon quarry during the week ending August 26, follows:

DATE.	Hours worked.	Cubic Yards.
August 21	4.30	1,875
August 22	7.50	2,102
August 23	8.20	3,338
August 24	6.55	3,012
August 25	5.05	1,808
August 26	6.40	2,407
Total	38.00	**14,542**

Obituary.

George Alfred Caldwell, sanitary inspector at Gatun, died at Colon Hospital on August 26. He was 46 years of age, single, and was born in Kentucky. He was appointed to service on the Isthmus as a draftsman in the Division of Building Construction on July 29, 1904, and was transferred to the Department of Sanitation on January 1, 1907.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The moving picture schedule for the week, September 4 to 9 is, as follows: September 4, Gorgona; September 5, Gatun; September 6, Cristobal; September 7, Culebra; September 8, Corozal; September 9, Empire.

CULEBRA.

The game of volleyball between the Married Men and the Bachelors on Friday evening resulted two to one in favor of the Bachelors.

A volleyball tournament has been organized with five teams—Quartermaster, Chief Engineer, Married Men, Independent, and All Star.

Messrs. Dougherty and Case have been chosen as captains of the Culebra bowling teams to_represent Culebra in the Isthmian league.

EMPIRE.

The following high scores were bowled on the alleys during the past week: Tenpins—Giavelli, 208; Pinney, 212; Pearson, 214; Gustavson, 213. Duckpins—Pinney, 100, 124; Grund, 109; Scull, 100; McLeod, 103, 104, 105; Payne, 102; Pulsifer, 101; Danielson, 114; Davis, 107.

In the handicap tenpin tournament just closed, the following medals were won: Highest average. C. Anderson, 186.1; second high average, J. Spinks, 185.9; highest percentage of games won, L. Giavelli, 31 out of 34; second high average, F. L. Gorham, 23 out of 34; highest flat score, L. Giavelli, 243; highest handicap score, R. Kosier, 249 (handicap 20).

On Saturday evening, September 2, the Isthmian tenpin tournament will open, with Gatun playing at Empire.

In the boys' handicap duckpin tournament just closed, the following were winners: High score, Donald Benninger, 113; high average, Maurice Witt, average 88.2; most games, Wallace Catte, 11 out of 17.

The subject for discussion by the literary and debating society for September 1 will be "Personal economy as a factor in industrial conditions."

GORGONA.

The Hearons Sisters' Concert Company appeared before an audience of over 300 on Tuesday night, August 22, and will fill a return engagement on Saturday, September 9, with an entire change of program.

It has been decided to close the membership contest on Saturday night, September 23, when a "smoker" and entertainment will be given in honor of the winning team, the Gorgona indoor baseball team, champions of the Isthmian league, and the new members.

The monthly song service on Sunday night, August 27 was attended by about 150 people. The Rev. A. A. Nellis of Empire delivered an address, and Mrs. Jas. H. Murray, contralto, rendered two solos—"Absence" and "The Rosary"—in addition to the usual singing by the audience. The choir consisted of ten young ladies of Gorgona.

The following members have been appointed a house committee to promote the general comfort and satisfaction of patrons, and make suggestions as to changes or improvement of the accommodations and service: C. Patterson, L. W. Hennen, Manning Meeks, W. J Earle, H. D. Burnham, J. C. Deavours, and W. H. Keenan.

The dramatic society is rehearsing a two-act comedy sketch, which they expect to present in the near future. Arrangements have been made for the purchase of the necessary properties.

The tenpin bowling match between Camp Elliott and Gorgona on the local alleys on Saturday evening, August 28, resulted, as follows:

CAMP ELLIOTT.				GORGONA.			
May	154	138	119	M. Van	195	157	187
Wright	142	174	158	Humphrey	149	154	188
Schwartz	139	141	172	Haldeman	203	134	144
Simpson	103	142	154	Haggerty	149	156	168
Martins	167	165	159	Roper	200	144	159
Total	705	760	762		896	745	846

GATUN.

The preliminary chess and checker tournament resulted, as follows:

Checkers	Won.	Lost.	Drawn.
Gartrell	15	0	3
Lincoln	11	3	1
Chatfield	8	4	2
Barte	7	7	2
Clarke, F. L.	5	9	2
Clarke, J. B.	3	7	7
Chess—			
Hall	11	3	0
Grier	9½	2½	1
McQueen	4	2	0
Chatfield	6	6	0
Horle	2	2	0

In the present tournament each player will have four games of chess with each other player, and nine games of checkers. Ten chess players have entered the tournament.

At the last meeting of the wrestling class the members decided to hold their meetings twice each week. During the absence of Fred Huber, J. W. Wilson will act as instructor.

The Cristobal tenpin bowling team won two out of three games from Gatun on Saturday night.

CRISTOBAL.

At the opening meeting of the literary and debating club on August 23, a program was enjoyed by an audience of over 100. Refreshments were served, the ladies furnishing home made cake.

The subject for debate on September 6 is "Resolved, that immigration should be further restricted."

An order for new library books will be sent to the States. Any one knowing of good new books is requested to leave the names at the office.

The States entertainment given by the Hearons Sisters on Thursday night was attended by an audience of over 300. A return engagement, in the form of a sacred concert, will be given on Sunday night, September 3, at 9 p. m. This entertainment will be free to all.

The following are the leaders in the local tenpin handicap tournament:

	Won.	Lost.	P. C.
Weaver	15	3	.833
Peterson	5	1	.833
Louch	19	4	.826
Beard	17	4	.809
Buser	9	5	.643

Next Saturday night the opening games in the Isthmian tenpin league will be rolled on the Cristobal alleys between Culebra and Cristobal.

The following high scores were rolled during the week: Tenpins—Louch, 216, 216, 200; Rigney, 208; Wheeler, 203; Babbitt, 210; Burgoon, J., 205; Atkins, 200; Collins, 205, 202; Claherty, 212. Duckpins—Poore, 102; Louch, 106; Hess, 100, 106, 103.

Distances on Canal Zone Roads.

The distances along the Canal Zone Highway from Panama to Gorgona are, as follows:

FROM	TO	MILES.
R.R. station, Panama	Junction of road to Sabanas and Corozal road	0.79
R.R. station, Panama	Corozal R.R. station	4.03
R.R. station, Panama	Junction with road leading to Miraflores R.R. station	7.23
R.R. station, Panama	Pedro Miguel R.R. station	8.94
R.R. station, Panama	Church at Paraiso	10.20
R.R. station, Panama	East end of Empire suspension bridge	13.89
R.R. station, Panama	Empire R.R. station	14.56
R.R. station, Panama	Las Cascadas road crossing near corral	17.32
R.R. station, Panama	Junction with Marines' road to Bas Obispo station	19.00
R.R. station, Panama	Gorgona R.R. station	21.92
East end of Empire suspension bridge	End of macadam road leading to Las Cascadas plantation	2.88
R.R. station, Empire	End of the finished portion of road leading toward Chorrera	0.51
R.R. Station, Empire	End of graded portion of road leading toward Chorrera	1.70
R.R. station, Empire	R.R. station Culebra	1.20
Junction of the main highway and the Marines' road to Bas Obispo station	R.R. station, Bas Obispo	0.30
Junction of Sabanas and Corozal roads	Police station, Sabanas	2.37
Junction of Sabanas and Corozal roads	Zone line on Sabanas road	3.12

Supplies for Canal Work.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, and Colon, during the week ending August 26:

Santona, August 21, from Baltimore, with 140 packages filter plant material, 52 pieces structural steel, 38 bundles steel rails, 1,580 pieces steel ties, 34 bundles lock material, 8 pieces lock material, 6 cases lock material, for Atlantic Division; 15 bundles lock material for Pacific Division; 9 barrels furnace castings, 126 pieces white oak lumber, 370 pieces couplers, for Mechanical Division; 1,200 kegs bolts, 5,000 bundles tie plates, 472 barrels crushed sulphate, 70 barrels lump alum, 1,500 cases dynamite, for stock.

Prinz Joachim, August 21, from New York, with 23 pieces castings for Atlantic Division; 14 cases paper for stock.

Montoso, August 22, from New York, with 89,400 bags cement for Atlantic and Pacific Divisions.

Abangarez, August 24, from New Orleans, with 35 pieces piling for Atlantic Division; 16 pieces steam shovel chains for Central Division; 10 pieces castings for Pacific Division; 425 pieces white oak lumber for Mechanical Division; 30 crates library paste, 921 bales hay, 23 bales duck, 125 pieces yellow pine lumber, 314 pieces yellow pine lumber, 914 bundles ceiling lumber, 1,693 bundles flooring lumber, for stock.

Zacapa, August 24, from New York, with 21 cases tape fuse and 16 barrels glassware for stock.

Advance, August 25, from New York, with 10 barrels paint, 6 cases car seals, 100 kegs spikes, 250 pieces rail joints, 29 bundles sheet iron, 9 cases insulated wire, 20 pieces lumber, 12 barrels graphite, 97 pieces pig lead, for stock; 10 pieces steam shovel chains for Central Division; 7 cases dredge sleeves for Atlantic Division; 170 cases glassware, 35 cases drugs and sundries, for Sanitary Department; and a miscellaneous cargo, the whole consisting of 720 packages, weighing 86 tons.

Prinz Eitel Friedrich, August 26, from New York, with 236 cases blasting caps for stock.

Married.

BATES-DEVOL—At Culebra, C. Z., on August 24, the Rev. Henry Collins officiating, Lucile Scott, daughter of Lieutenant-Colonel and Mrs. C. A. Devol, to Albert G. Bates.

ALLYN-McEWEN—At Cristobal, C. Z., on August 24, Laura D. McEwen of Ottawa, Kansas, to John C. Allyn of Springfield, Missouri, the Rev. J. L. Wise officiating. Canal Zone residence, Gatun.

Rainfall from August 1 to 26, 1911, Inclusive.

STATIONS.	Maximum in one day.	Date.	Total for period.
Pacific Section—	*Ins.*		*Ins.*
Ancon	1.94	12	6.18

Fri., Aug. 25	128.0	94.1	47.2	16.3	16.0
Sat., Aug. 26	127.9	94.0	47.5	16.3	15.9
Height of low water	125.0	92.0	44.0		

The following vessels arrived at, or departed from the port of Balboa during the week ending August 26:

Arrivals—August 20, *City of Panama*, from San Francisco; August 21, *Guatemala*, from Callao; August 22, *Mackinaw*, from San Francisco; *Manavi*, from Buenaventura; *Peru*, from Guayaquil; August 26, *Oberon*, from Port Harford.

Departures—August 22, *Quito*, to Guayaquil; August 23, *Palena*, to Valparaiso; August 24, *Stanley Dollar*, to San Francisco; August 25, *Peru*, to San Francisco; August 26, *City of Panama*, to San Francisco; *Manavi*, to Buenaventura.

LOST—In Colon, or on train No. 73, a ladies' gold locket and chain with initials "E. M." Reward, if returned to W. D. McHenry, Gatun.

OFFICIAL CIRCULARS.

Illuminating Oils and Lubricants.

CULEBRA, C. Z., August 15, 1911.

CIRCULAR NO. 314-G. (Superseding CIRCULAR NO. 314-B.):

The following list of illuminating oils, and lubricating oils and greases, will be considered as standard for the Isthmian Canal Commission and Panama Railroad Company, and will be used only for the purposes indicated, excepting only as noted in the last paragraph of this order. All requisitions on the Quartermaster's Department shall specify the oil or lubricant desired, either by the I. C. C. number given below, or by name, or by both, and no name other than that given below for each particular oil or lubricant shall be used in designating the same on requisitions, etc. No oils or lubricants will be requisitioned for unless the same are included in the following list, until after application for authority to procure same, showing the necessity therefor, has been first submitted to, and approved, by me.

The metal drums in which most of the lubricating oils are furnished have to be returned to the oil contractor in good condition. Care should, therefore, be exercised in their handling to prevent both damage and loss of oil, and in no case should they be used as a continuous container for the same or any other oils, but, when empty, should be returned promptly to the Quartermaster's Department.

The prices given below indicate the actual cost to the Commission and Panama Railroad Company of all oils and lubricants, delivered at Cristobal, under the present annual contract, (cost of drums not included) and are not intended to supersede the prices given in the price book of the Quartermaster's Department, and should not be used in the material accounts.

I. C. C. No. 1. *Valve oil*—For the internal lubrication of steam valves and cylinders on all classes of equipment. Cost, per gallon, in drums, $0.195.

I. C. C. No. 2. *Air compressor cylinder oil*—For the internal lubrication of air cylinders of air compressors, and for pneumatic hammers and drills. Cost, per gallon, in drums, $0.15.

I. C. C. No. 3. *Marine engine oil*—For marine engines, but not in crank cases, where it would be agitated and mixed with water, for, being a compounded oil, it would emulsify if so used; also for the block bearings of suction dredges. Cost, per gallon, in drums, $0.275.

I. C. C. No. 4. *Stationary engine oil*—For stationary engines, electric dynamos, and motors, wood and metal working machinery, and for the general lubrication of machinery; also, for dies of bolt cutters, turret lathes, etc., except where the use of lard oil is permitted. (See note under lubricant No. 11.) Cost, per gallon, in drums, $0.13.

I. C. C. No. 5. *Locomotive engine oil*—For all locomotives, running gear of all locomotive cranes, deck machinery of dredges (except engines,) and for cold saws in machine shops. Cost, per gallon, in drums, $0.11.

I. C. C. No. 6. *Turbine engine oil*—For all step bearings of turbines in the Miraflores and Gatun power plants only. This oil is also known as step bearing oil. Cost, per gallon, in drums, $0.13.

I. C. C. No. 7. *Gas engine oil*—For the cylinders of internal combustion engines. Cost, per gallon, in drums, $0.23.

I. C. C. No. 8. *Westinghouse crank case oil*—For use in the crank cases of Westinghouse vertical compound engines only. Cost, per gallon, in cans, $0.20.

I. C. C. No. 9. *Car oil*—For the journals of all cars, passenger coaches, locomotive tenders, and rolling stock generally; for steam shovel bearings where not equipped with grease cups, and for tripod drills and switches. Cost, per gallon, in drums, $0.10.

I. C. C. No. 10. *Transformer oil*—For use in the electrical subdivision in aircooled transformers only. Cost, per gallon, in drums, $0.28.

I. C. C. No. 11. *Lard oil*—For hand torches for illuminating purposes only on marine equipment. On land, for shop use on pipe-threading machines; and it may be substituted for stationary engine oil (I. C. C. No. 4,) when necessary, on dies of turret machines and on bolt cutters, when working refined iron or tough machinery steel. The use of this oil should be minimized to the greatest possible extent on account of its high cost. Cost, per gallon, in cans, $0.80.

I. C. C. No. 12. *Ammonia cylinder oil*—For the internal lubrication of cylinders of ammonia compressors only. Cost, per gallon, in drums, $0.35.

I. C. C. No. 13. *Crude oil*—For the lubrication of steam shovel chains, cables, where designated, and general purposes where oils and greases have been used as a preservative. Cost, per gallon, in barrels, $0.0262.

LUBRICATING GREASES.

I. C. C. No. 20. *Nonliquid oil*—This is an oil of the consistency of vaseline, for the lubrication of sheaves of carriages on the Lidgerwood cableways at Gatun, for air brake cylindrs, and triple valves, and such pneumatic drills and motors as may be equipped for the use of grease. Cost, per pound, in barrels, $0.05.

I. C. C. No. 21. *Cup grease (yellow)*—For all classes of lubrication where grease is used in compression cups. This grease is being received in two consistencies, No. 3 and No. 5, the No. 3 of lesser consistency to be used on machinery subject to normal temperature, and the No. 5 of heavier consistency to be used on machinery subject to higher temperatures. Cost, per pound, in cans, $0.06.

I. C. C. No. 22. *Gear grease*—For all classes of lubrication requiring grease for which compression cups are not adapted. This includes the center and side bearings of cars, cranes, and steam shovels, also wire cables, both standing and running, etc. Cost, per pound, in cans, $0.0275.

I. C. C. No. 23. *Cable grease*—For the "Interlocked-wire" track cables of the Gatun cableways exclusively. Cost, per pound, in barrels, $0.0275.

I. C. C. No. 24. *Crank pin grease*—For use on locomotive crank pins only where pressure cups are used. Care should be exercised not to confound this grease with cup grease Nos. 3 and 5, (I. C.C. No. 21,) which is not suitable for this purpose. Cost per pound, in barrels, $0.0525.

ILLUMINATING OILS.

I. C. C. No. 30. *Signal oil*—For use in railroad lanterns only, and in the cab lights of engines. Cost, per gallon, in cans, $0.37.

I. C. C. No. 31. *Kerosene oil*—For use in locomotive headlights, passenger coach, and similar lamps, ordinary lanterns, and for cleaning purposes. Cost, per gallon, in drums, $0.1008; in cans, $0.1735.

GASOLINE.

I. C. C. No. 40. *Gasoline*—For use on gasoline launches, motor cars, blow torches, cleaning, etc. Cost, per gallon, in drums, $0.1863; in cans, $0.2590.

Standard hand oilers and oil cans should be used as provided in circular No. 338.

A copy of this circular shall be posted in all stationary plants, shops, engine houses, storehouses, oil houses, on all marine equipment, and in such other places as may be necessary to insure the cognizance of same by all concerned.

Substitutions of cheaper grades of the standard I. C. C. and P. R. R. lubricants given above, may be approved by the traveling engineers, wherever practicable, the above circular defining in a general way their accepted uses.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Inspector of Fuel and Lubricants.

CULEBRA, C. Z., August 21, 1911.

CIRCULAR NO. 266-H:

Effective this date, Mr. James E. Johnson is appointed inspector of fuel and lubricant consumption, and, as such, will report directly to the Assistant to the Chief Engineer.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Waste of Coal in Unloading.

CULEBRA, C. Z., August 23, 1911.

CIRCULAR NO. 402:

Waste of coal resulting from unloading it directly on the ground at different points on the Isthmus is an appreciable item, and should be minimized by exercising due care, and, wherever possible, by providing a floor of old wood or metal material on which to unload it. Scattered piles of unused coal should in all cases be cleaned up and utilized as the work proceeds.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Charges Against Employes.

CULEBRA, C. Z. August 25, 1911.

CIRCULAR NO. 403:

Any employe, against whom charges of any kind are made, shall be permitted to be present during any formal hearing or investigation conducted where the testimony of witnesses is heard by a board or official, and to call or cross-examine witnesses.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Shop Expense Percentage.

CULEBRA, C. Z., August 24, 1911.

HEADS OF DEPARTMENTS AND DIVISIONS:

In accordance with the provisions of circular No. 169-E, the following shop expense percentage for each shop is hereby fixed, effective September 1, 1911, and will be applied, until further orders, to the distributed labor used in all shop work, in accordance with the provisions of circular No. 264-A, viz.:

DIVISION OR SHOP.	Shop expense per centum.
Mechanical Division	37.5
Empire shop	30
Drydock shop	45
Balboa shop	25
Porto Bello	20

Circular letter from this office dated May 5, 1911, is revoked.

GEO. W. GOETHALS.
Chairman and Chief Engineer

Oil Cans.

CULEBRA, C. Z., August 24, 1911.

CIRCULAR NO. 338-B:

The following additions and amendments to circular No. 338 are hereby approved for the guidance of all concerned:

No. 40. Twenty-four-inch spring hand oiler (standard locomotive type) for use on locomotives and steam shovels only. Capacity, 2 pints.

No. 47. Eighteen-inch spring hand oiler (same type and material as No. 40), for use on dredges, cranes, cableways, and smaller equipment than locomotives and steam shovels.

Requisitions for the above will be honored only after approval by the traveling engineers.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Standard Coal Scoop.

CULEBRA, C. Z., August 25, 1911.

CIRCULAR NO. 404:

Hereafter, the No. 3 scoop will be adopted as the standard for use of firemen on all coal-burning plant and equipment, and in all stationary plants where coal is used as fuel. Future requisitions for the purchase of scoops in the United States for this purpose shall specify the No. 3 scoop.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Care in Unloading Coal Cars.

CULEBRA, C. Z., August 25, 1911.

CIRCULAR NO. 405:

My attention has been invited to the fact that coal is being left on the ends of cars when unloading them. This is an uneconomical practice, and should be discontinued. It is directed that hereafter in the unloading of coal cars, coal be removed from the ends as well as from the body of the cars, and failure to do this will render the employe or employes responsible liable to a suspension of from one to five days for each offence. Heads of departments and divisions will be expected to see that this order is enforced.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Misdirected Letters.

ANCON, C. Z., August 30, 1911.

The following insufficiently addressed letters, originating in the United States and its possessions, have been received in the office of the Director of Posts, and may be secured upon request of the addressee:

NOTES OF PROGRESS.

Naos Island Breakwater.

The board appointed by the Chief Engineer on July 8, consisting of Messrs. S. B Williamson, W. G. Comber, M. W Tenny, and W. T. Reynolds has submitted the following report, the recommendation in which has been adopted:

"The outer end of the filling is now (August 12) 4,200 feet from the island, and the trestle work extends 1,500 feet beyond, leaving an opening of 2,700 feet between the end of the trestle and the island. Two plans for completing the work were discussed, as follows:

"First—To drive a trestle parallel to, and about 300 feet west of, the present structure, swinging the former onto the axis of the breakwater after clearing the trestle now in position, and continuing along said axis to the island; the idea being that filling the present trestle may continue, while at the same time, trains may be run out to the end of the proposed trestle and filling begun from the island after sufficient material has been dumped along the line of the new trestle to make it perfectly secure.

"The second plan contemplates the construction of a double trestle, similar to that employed in the construction of Toro Point breakwater. * * * * * It is proposed to first fill on both sides of the structure for its entire length up to mean tide, using Lidgerwood trains, then begin at the outer or island end, to fill from mean tide to full height.

"In both plans it is proposed that rock, dredged from the Canal channel by the Pacific Division, shall be deposited in front of the trestle, so as to form a base about 200 feet wide, and that the trestle constructed in future shall be of a better type than that driven previously.

"The board believes that the second method is preferable and the most economical, and, if adopted, will reduce the time required for completion under the present method by approximately one-half.

"It is further thought that the additional width and improvement in the type of trestle will materially increase its stability. This opinion seems to be borne out by the experience so far at Toro Point, where there is about the same average depth of soft material. The report of Mr. Vandeburgh of October 14, 1909, seems to indicate that the material at the Naos Island breakwater is softer, and contains a smaller proportion of sand than that along the site of the Toro Point breakwater. The board, however, is not convinced that this is proved conclusively by Mr. Vandeburgh's test, because the pipe used for collecting the samples was so arranged that it probably gathered samples from the surface in most cases. It is also noted that the worst slips on the dike took place where the samples showed sand only, and the penetration of the pipe was small.

"Attention is especially invited to the proposed method of filling in the second plan, viz.: To first fill the entire length to about mean tide. then complete the filling from the outer end. This is recommended, because experience has shown that there is no movement of the trestle until filling above mean tide is begun. The filling below mean tide will increase the stability of the trestle, and, if subsequent filling is begun from the outer end, train service will not be interrupted, even though there be a movement of the structure at the point of filling.

"The board has the honor to recommend the second plan, viz.: The use of a double trestle, and suggests that the filling of the 1,500 feet of trestle now in place be continued, as heretofore, which will require about five months, and that in the meantime, the necessary material be obtained and a double trestle started from the outer end of the present structure, and continued to Naos Island. * * * * *."

Both the Pacific and Central Divisions have begun work on the plan outlined in the recommendation of the board.

Rainy Season Record in Culebra Cut.

The total excavation in the Central Division for the month of August, was 1,464,294 cubic yards, of which 1,442,402 cubic yards were taken from the Culebra section. This is the greatest amount of material ever removed from the Culebra section in any month of the rainy season since the commencement of the work by the United States.

Previous August records of excavation in the Culebra section are, as follows:

1911—1,442,402 cubic yards.
1910—1,377,714 cubic yards.
1909—1,173,370 cubic yards.
1908—1,171,927 cubic yards.

Regiment of Infantry for Canal Zone.

A regiment of United States infantry will leave Galveston, Texas, on or about September 12, and will arrive in the Canal Zone about eight days later. It will go into temporary camp near Las Cascadas. Two old labor camps, consisting of old French barracks, have been fitted up for the enlisted men, with Standee bunks two tiers high, and a separate mess for each of the twelve companies. Two battalions will be stationed at the old Whitehouse labor camp, and one at the Las Cascadas labor camp. The building formerly used by the Central Division as a time office will be the office of the commanding officer. The officers will be quartered in two type-18, and one type-16, bachelor quarters in Las Cascadas village The present complement of the regiment is 816 men and 50 officers. A battalion of U. S. Marines has been stationed in the Canal Zone since 1904.

Chartered Vessel for P. R. R. Service.

The steamer *Lewis Luckenbach*, 3,905 gross tons, has completed its first voyage from Philadelphia to Cristobal and return, as a ship of the Panama railroad service. It was chartered from the original charterers, Bates & Chesebrough of the California-Atlantic line on June 29, at the rate of $8,712.50 a month, and arrived at Colon on its first voyage with a full cargo of 6,000 tons on August 1. It sailed on the return voyage on August 18. The charter runs for six months.

Two Years of Lock Building in the Pacific Division.

Concrete construction in the locks at Pedro Miguel was begun on September 1, 1909, two years ago last Friday, and, at the close of work on that date, there had been laid a total of 705,698 cubic yards, place measurement, leaving still to be placed 149,803 cubic yards. During the first year of operations there were laid 261,964 cubic yards, and, during the second year, 443,734 cubic yards, place measurement.

From the date of beginning up to July 6, 1910, concrete was produced by small mixers stationed in the lock pit. and by two auxiliary 2-cubic yard mixers, situated on the east and west banks of the locks, respectively. On the latter date, the two berm cranes, and three of the chamber cranes of the permanent handling plant, were placed in operation, and, by the following month, all the units were working.

During the past year, the concrete work has been principally confined to the building of the center and side walls, which are now practically completed, and the general work had so far advanced by May 20 of the present year as to permit of the dismantling of a part of the construction plant. Two berm cranes and two chamber cranes have been taken down and reerected at Miraflores. The two chamber cranes remaining at Pedro Miguel are mainly used in lifting the iron work and other heavy material into place, although a small portion of the concrete output is handled by them when it is advantageous to do so. The mixing plant now consists of three 2-cubic yard, and three ½-cubic yard

NOTES OF PROGRESS.

(*Continued.*)

mixers. Part of their output is dumped directly into the forms, and part is conveyed into place by locomotive cranes and derricks.

The work has been performed in 8-hour working days, and the amount of concrete placed by months from the beginning of the work on September 1, 1909, to September 1, 1911, was, as follows:

MONTHS.	1909.	1910.	1911.
	Cu. Yds.	*Cu. Yds.*	*Cu. Yds.*
January	....	16,273	38,513
February	....	13,218	37,011
March	....	18,793	44,716
April	....	24,522	28,635
May	....	29,576	19,135
June	....	30,631	18,243
July	....	41,464	19,906
August	....	51,264	*20,736
September	2,370	50,702	....
October	8,310	61,422	....
November	10,169	64,248	....
December	13,007	42,834	....
Total	33,856	444,947	226,895

*All the above figures, except for August, are based on place measurement.

The concrete remaining to be laid consists principally of wing wall construction, the building of the north center guide wall, the completion of the south center guide wall, construction of Stoney buttresses, and the arch in the east wall, the arches in the center and west wall having been practically finished. The distribution of the concrete yet to be placed, by cubic yards, is about as follows:

LOCATION.	Plain.	Reinforced.
Above upper guard gate—	*Cu. Yds.*	*Cu. Yds.*
East wall	12,532	205
West wall	10,351	235

July	3,672	32,840
August	6,030	*60,954
September	18,133	....
October	22,159	....
November	23,871	....
December	21,533	....
Total	97,028	271,329

*Bucket measurement; all other figures based on place measurement.

The total amount of concrete laid at the Pedro Miguel and Miraflores locks from the date of beginning up to August 1, place measurement, is as follows:

PEDRO MIGUEL LOCKS.

YEAR.	*Cubic Yards.*
1909	33,856
1910	444,947
1911, to August 1	206,159
Total	684,962

MIRAFLORES LOCKS.

1910	97,028
1911, to August 1	210,375
Total	307,403
Grand total	992,365

The total amount of concrete laid at Pedro Miguel Locks in August was 20,736 cubic yards, and at Miraflores Locks, 60,954 cubic yards, bucket measurement, making the grand total of concrete laid in the Pacific Division locks to September 1 about 1,074,055 cubic yards.

CONCRETE WORK IN THE LOCKS.

About 63 per cent of the concrete for all the locks is in place, the amount at the close of the work on September 2, being 2,675,008 cubic yards, out of a total of approximately 4,199,400. A total of 32,879 cubic yards of concrete was laid in the locks during the week ending September 2.

GATUN LOCKS.

Over 78 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on September 2, being 1,570,846 cubic yards, out of a total of 2,000,000 A statement of the amount of concrete placed in the locks each working day for the week ending September 2, and of the total, follows; and a similar statement for the work in the Spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

ORDINANCES.

Amendment to Ordinance Providing for Certain Taxes and Licenses in the Canal Zone Other Than for the Sale of Intoxicating Liquors.

Be it enacted by the Isthmian Canal Commission, that Section 7 of the Ordinance providing for certain taxes and licenses in the Canal Zone other than for the sale of intoxicating liquors be, and the same hereby is, amended by adding at the end thereof the following:

Provided: That the Collector of Revenues may refuse to issue a license for any of the objects named in paragraphs (b), (e), (f), (g), (i), (j), and (k) if the character of the applicant is such as to warrant the belief that the exercise of the privilege granted by the license would not be conducted in an orderly and lawful manner, and *Provided further*, That any license granted pursuant to the provisions of paragraphs (b), (e), (f), (g), (i), (j), and (k) of this section shall at once become null and void upon conviction in any court of the Canal Zone of a violation of law in the exercise of the privilege granted by such license, and *Provided further*, That licenses granted pursuant to the provisions of paragraphs (e), (g), (i), (j), and (k) hereof shall not authorize the exercise of such privileges during the hours from 12 midnight to 7 a. m.

Enacted by the Isthmian Canal Commission, August 5, 1911.

Approved by the Secretary of War, August 22 1911.

Ordinance Providing for Night Quarantine Inspection of Vessels at the Port of Colon.

Be it enacted by the Isthmian Canal Commission, as follows:

SECTION 1. That vessels with perishable cargo arriving at Colon after sunset with the intention of sailing within a few hours, or before daylight of the following day, will be received by the quarantine officials until 10 p. m.

SECTION 2. Such vessels shall not be allowed to come to the wharf, and shall disembark and embark passengers by means of a tug.

SECTION 3. A tug shall be furnished the quarantine officer for the purpose of the visit of inspection.

SECTION 4. Any vessel, steamship company, or agent of a steamship company requesting this service, shall pay to the Isthmian Canal Commission the sum of one hundred dollars ($100) United States currency, in addition to the expense of the tug furnished under Section 3 of this ordinance for each vessel so inspected.

Enacted by the Isthmian Canal Commission, August 5, 1911.

Approved by the Secretary of War, August 22, 1911.

Ordinance Establishing Market Regulations for the Canal Zone.

Be it enacted by the Isthmian Canal Commission, that the following regulations for the conduct of public markets, and the leasing of space therein, shall be in force on and after their approval by the Secretary of War:

1. The markets are provided as places for the sale to residents of the Canal Zone of meat, fish, vegetables, fruits, and other articles of food, and the space in them will not be leased for any other purpose; *Provided*, That, in the discretion of the Superintendent of Public Works, not more than one-half of the space available in a public market may be leased for the sale of dry goods, groceries, notions, cigars, tobacco, soda water, and other soft drinks, and for use as lunch counters and news stands where no application has been received for the leasing of the space for the sale of food products, but the Superintendent of Public Works shall have authority to cancel the assignment of space leased for the purposes enumerated in this proviso, should application be made for such space for use for the sale of food products; *Provided further*, That, when space is leased for the sale of dry goods, groceries notions, cigars, tobacco, soda water. and other soft drinks, and for use as lunch counters and news stands, the rate of rental shall be twenty (20%) per cent, in advance, over that charged when used for the sale of food products.

2. All assignments of space shall be for the period of one month, beginning on the 16th day thereof, and ending on the 15th day of the succeeding month; except that assignments made after the first of any month shall be for a half month, counting from the first of the month, and shall be paid for at one-half the monthly rate; and except also that this shall not apply to tables and other similar space rented by the day, and so indicated on the posted plat.

3. There shall be posted in a conspicuous place in each market a plat signed by the Superintendent of Public Works, and Collector of Revenues, showing the sizes and rates of rental of the various stalls, and other divisions of space.

4. Application for assignment of space shall be made to the Market Inspector. If approved, the inspector will issue an assignment, indicating the space assigned, the period of assignment, the purpose for which it is to be used, and the amount of rental to be paid to the Deputy Collector of Revenues. Upon return of the assignment, with the exhibition of the Deputy Collector's receipt, possession of the space will be given.

5. Not more than one stall or other division of space in each market will be assigned to any one person, except by special authority of the Superintendent or Assistant Superintendent of Public Works.

6 Lessees of space will not be permitted to make any changes in the arrangement of partitions, shelves, etc. Requests for desired changes will be made of the Market Inspector. If approved by him, he will secure an estimate of the cost of the work, and, upon deposit with him by the lessee of the amount of the estimate, the work will be done by the Isthmian Canal Commission. The excess of the deposit, if any, over the cost of the work, will be returned to the lessee.

7. All stalls and other divisions of space shall be thoroughly swept at the close of each day. Special attention shall be given to the spaces used for the sale of meat and fish· the counters, blocks, etc., used in them shall be scrubbed with soap and water as often as necessary to keep them in good sanitary condition. All decayed fruit and vegetables, and other dirt and refuse, shall be removed and deposited in the sanitary cans provided for that purpose. All articles in bulk shall be kept in bags, barrels, or boxes, so that they can be moved in cleaning. Lessees shall be responsible for the cleanly and sanitary condition of the space assigned them, and shall carry out such special instructions to that end as may be given them by the Market Inspector or his authorized assistant. The Market inspector will be responsible for the cleanly and sanitary condition of the market outside of stalls and other space assigned to lessees.

8. Lounging or loitering around the market will not be permitted. Lessees are expected to enforce this prohibition as to the space assigned them.

9. The hour for opening and closing each market shall be fixed by the Superintendent of Public Works, and posted in a conspicuous place in the market.

10. Any complaint respecting a market should be addressed to the Superintendent of Public Works, Ancon, C. Z.

11. The continued occupancy of space in any market after the expiration of the period for which rental has been paid is declared a misdemeanor, and, upon conviction thereof, shall be punishable by a fine not exceeding $25, or imprisonment in jail not exceeding thirty (30) days, or both, in the discretion of the court. Any other violation of these regulations by a lessee shall be considered sufficient cause for the cancellation of his assignment; but such cancellation shall not relieve the offending person from prosecution under any penal law or ordinance he may violate.

12. These regulations shall be posted in a conspicuous place in each market.

Enacted by the Isthmian Canal Commission, August 5, 1911.

Approved by the Secretary of War, August 22, 1911.

The Six-Year Men.

The following circular letter has been sent out to employes who have completed six years' continuous service on the Isthmus. The committee in charge requests that men whose names may have been omitted from its mailing list, will communicate with its chairman:

"At a meeting in Panama on August 12, preliminary steps were taken to perfect an organization of employes of the Isthmian Canal Commission and the Panama Railroad Company, who have completed six years' continuous service on the Isthmus. The possible objects of such an organization were discussed, and a constitution was adopted, subject to final approval at a more general meeting, to which all persons eligible to membership, and who had signified an intention to join the society, should be invited. The undersigned were appointed a committee to determine on a name for the society, select a design for its emblem, solicit members, and make the necessary arrangements for the first general meeting.

"There are now approximately four hundred men on the Isthmus who are eligible for membership in the society, or will become eligible before November 1, 1911. The number will increase rapidly thereafter, and, it is estimated that before the official opening of the Canal, some fifteen hundred men will have completed six years' continuous service on the Isthmus. The majority of these men will be known to one another; they will have many common interests, and a strong motive for maintaining mutual relations in after years. The society will serve them as a means of intercommunication and friendly cooperation.

"We are sending you herewith a copy of the constitution of the society, which will explain in greater detail its aims and plan of organization. If it is your wish to be enrolled as a charter member, please sign the attached card, and return it with a remittance of three dollars—the dues for one year—to Mr. C. A. McIlvaine, treasurer *pro tem*, Culebra, C. Z.

"The time and place of the first general meeting will be announced later in THE CANAL RECORD.

"The committee would be glad to receive suggestions for a name for the society, and designs for its emblem, as well as proposals relating to any enlargement of its aims which you might consider desirable."

Very truly,

JOHN K. BAXTER, WILLIAM F. SHIPLEY, R. E. WOOD, C. A. MCILVAINE, JOHN J. MEEHAN.

CULEBRA, C. Z., August 31, 1911.

A slot machine containing sanitary drinking cups has been installed in the Commission clubhouse at Gorgona.

STEAM SHOVEL RECORDS.

Work in Central Division in August.

During the month of August, the total amount of material excavated in the Central Division was 1,464,294 cubic yards, of which 191,485 cubic yards were classified as earth, and 1,272,809 cubic yards as rock. Of this quantity, 1,442,402 cubic yards were removed by steam shovels, and contractors removed 9,972 cubic yards by sluicing, and 11,920 cubic yards by hand.

The high record for the month was made by shovel No. 256, working 27 days in the Culebra district, which excavated 64,256 cubic yards of rock.

The second best record for the month was made by shovel No. 227, working 27 days in the Culebra district, which excavated 62,627 cubic yards of rock.

The best record for a shovel of the seventy-ton class was made by shovel No. 109, working 27 days in the Culebra district, which excavated 43,573 cubic yards of rock and earth.

Shovel No. 253, working in the Empire district, made a high record for one day by excavating 3,610 cubic yards of rock on August 1.

Except where noted, monthly reports are computed by place measurement, while the daily reports are based on car measurement. The best records for the month, and for one day, are shown below:

Steam Shovels on Relocated Line in August.

The total excavation on the relocated line of the Panama railroad amounted to 371,076 cubic yards. Of this amount, 216,855 cubic yards were classified as borrow (75 per cent solid rock), 99,015 cubic yards as earth, 1,411 cubic yards as loose rock, and 53,795 cubic yards as solid rock.

Company forces removed 369,066 cubic yards, and 2,010 cubic yards were removed by the contractor.

Steam shovels excavated 359,363 cubic yards. Pan car task gangs took out 7,763 cubic yards, and 1,940 cubic yards were excavated for culvert foundations.

The best month's record was made by steam shovel No. 257, working in the Gatun section, which excavated 71,550 cubic yards of solid rock.

In the 70-ton class, the best month's record was made by steam shovel No. 117, working in the Monte Lirio section, which excavated 8,390 cubic yards of earth, and 25,180 cubic yards of solid rock, a total of 33,570 cubic yards.

The best day's record for shovels with 5-yard dippers was made by steam shovel No. 262, working at Monte Lirio, which excavated 3,800 cubic yards of earth and rock on August 21.

The best day's record for 70-ton shovels was made by steam shovel No. 113, working near Bas Obispo, which excavated 2,080 cubic yards of earth and rock on August 4.

Month's records are all place measurements, and day's records are car measurements. All material was loaded in 10-yard Western dump cars.

Pistol Championship Match.

The Culebra Pistol Club will hold an open championship match for the Canal Zone and the United States at the range in Culebra on September 10 to 17, inclusive. The range will be open all day on September 10 and 17, and from 12 to 2 and 5 to 7 o'clock each afternoon from the 11th to the 16th, inclusive, provided contestants make arrangements beforehand. The match will be shot under the rules of the United States Revolver Association, and will be held synchronously with matches held at twenty-five different ranges in the United States. There will be five events, all at fifty yards, and with the standard American target with eight-inch bull's-eye. Match A will be fifty shots with any ammunition and revolver; B, fifty shots with any pistol and ammunition; C, seventy-five shots with a military revolver and service ammunition; D, twenty-five shots with a military revolver and service ammunition; E, twenty-five shots with any pocket revolver and service ammunition. The entry fee for events A, B, and C, will be three dollars; for event D, one dollar; for event E, two dollars. Entrants should communicate with L. D. Cornish, Culebra. Gold, silver and bronze medals will be awarded as first, second, and third prizes.

Accidents to Panama Railroad Steamships.

The *Allianca* of the Panama railroad steamship line, which left New York on August 30 for the Isthmus, was disabled off Norfolk, Va., and obliged to put back to New York until repairs could be made to the machinery. The passengers and mails were transferred to the *Oruba* of the Royal Mail line, en route to the Isthmus, which is due to arrive at Colon on Sunday, September 10. The *Allianca* will sail from New York about September 23.

In latitude 30 degrees 40 minutes north, and longitude 74 degrees 15 minutes west, on August 26, the Panama railroad steamship *Colon*, on its voyage from New York to Cristobal, encountered an ordinary southeast gale, during which a sea was shipped forward that damaged the forward end of the dining saloon, broke a "strong back" at hatch No. 1, and washed away the ship's bell and a section of rail on the upper deck. Necessary repairs were made before the *Colon* left the Isthmus on the return voyage.

Visit of National Bankers' Association.

The excursion of the National Bankers' Association of the United States to the Canal Zone will be made in the three new steamships now building at Belfast for the United Fruit Company, the *Peralta*, *Sixola*, and *La Señora*. They will sail from New Orleans on November 25 at noon, and will arrive at Colon on the morning of November 30. The return trip will be made from Colon on December 2 While on the Isthmus the party will be in charge of the United Fruit Company, whose guides will conduct the members over the Canal work, and through the city of Panama.

Population of Panama and Colon.

A careful census has been taken of the cities of Panama and Colon by the Government of Panama, in connection with the national census now being concluded. The results are furnished the Commission by the Secretary of Foreign Affairs of the Republic, tabulated, as follows:

Sex.	Race or Family.					
	White	Mestizos	Negroes	Amarillos (Yellow)	Indians	Total
City of Panama.

Total..	2,615	4,407	10,007	619	100	17,748

CANAL ZONE AGRICULTURE.

Abstract of Report By Agricultural Experts.

The experts detailed by the Department of Agriculture to make an investigation into the agricultural possibilities of the Canal Zone, have made a report, which will be published by the department as one of its series of bulletins, and may be procured upon application to the Secretary of Agriculture, Washington. The investigation was conducted by Wm. A. Taylor, pomologist, and Hugh H. Bennett, scientist in soil survey, assisted in the field by H. F. Schultz, who, during the period of the survey—the winter of 1909–10—was in charge of the experimental gardens maintained by the Commission. The report is in two parts—(1) Reconnaissance agricultural survey, and (2) The outlook for agriculture in the Canal Zone.

The conclusions, with regard to agricultural possibilities, are, as follows:

> Large farming operations are impracticable in the Canal Zone on account of the broken topography. Small farms, operated by the proprietors, or under a central directive management, through which crop rotation and handling could be systematized and controlled, constitute the probable course of best agricultural development, especially where valuable, perishable products, destined for shipment outside the Canal Zone are concerned, such as choice mangoes, avocadoes, pineapples, mangosteens, chayotes, and other tropical fruits and vegetables which are apparently well adapted to conditions in the Zone. The staple crops best adapted to the conditions appear to be corn, cassava, yams of several species, sugar cane, plantains, bananas, and upland rice, with a large number of other tropical and subtropical crops of less importance in the Zone, including cocoa, coffee, and rubber.

The methods practiced are most primitive and transient, and little effort appears to have been devoted to selecting and developing desirable types, which alone can create an efficient and profitable agriculture The total crop production of the Zone at present is, in consequence, very small, and the products in general are of low quality, and incapable of maintaining other than very primitive standards of life. The occurrence of occasional choice strains, and individual trees and plants of superior excellence, indicates that great improvement in productiveness and quality of most of the products could be promptly secured by well directed, systematic plant introduction, and plant improvement work.

The most promising line of attack upon the agricultural problem of the Canal Zone will apparently be to develop a permanent mixed tropical agriculture, with a distinct horticultural trend, in which hand labor of tropical origin will be the main dependence for tillage. In this way, the existing and prospective conditions would favor the production of high priced products requiring regular and frequent transportation service, such as will doubtless be available promptly after the opening of the Canal for use. One important feature should be the early working out of a method of mixed cropping, in which soil maintaining and improving leguminous intercrops can be continuously used to replace the wild and intractable native vegetation of the present shack-farm agriculture.

To quickly and effectively develop such a method will doubtless require some intelligently directed experimental work, as it involves careful study of the whole question of plant relationships and antagonisms, one of the most important and far reaching problems in tropical agriculture, as well as the control of injurious insects and plant diseases. To meet the obvious needs, the following lines of work are suggested:

(1) A careful study of the existing cultivated types of crop plants of the Canal Zone, and the adjacent territory of the Republic of Panama, with the view to locating and perpetuating the better strains of such staple crops as have already demonstrated their adaptability to the conditions.

(2) Systematic introduction of promising types and varieties from other tropical countries, with a view to securing the best and most valuable varieties and strains that have been developed under similar conditions elsewhere. This feature is of special importance in the Canal Zone, because of the backwardness of the agricultural industry at the present time.

(3) The adjustment of some northern types of vegetables, and other perishable crops, to tropical conditions by selection and breeding. This will probably be a slow and tedious undertaking, but the fact that the maintenance of the Canal will probably necessitate the continuous presence of a considerable population of northern birth and tastes, who are not likely to be quickly or easily reconciled to tropical vegetable products, renders it well worth while to undertake.

(4) The development of more economical, effective, and permanent methods of farming, including contouring, tillage, crop rotation, and other points essential to the conservation of the soil and the maintenance of soil fertility. Special attention should be given to the introduction and establishment of crops needed for maintaining and encouraging the dairying and poultry industries, and to the establishment of these industries on a stable economic basis.

(5) The production of useful timber on lands not suitable for general agriculture, including such trees as the various species of eucalyptus, teak etc.

Canal Medals.

Seven hundred and twenty-six Canal medals, earned by Canal and railroad employes up to January 1, 1911, have been distributed on the Isthmus. The service bars are being engraved, and will be distributed within a month or six weeks.

Fund for Relief of Mrs. L. R. Dennis.

The following statement is published for the information of the Canal Zone people who contributed to the relief of the wife and children of the late L. R Dennis:

RECEIPTS.

Public subscription at Gatun	$598.25
Public subscription at Empire	440.52
Entertainment at Gatun	300.35
Canal Zone Red Cross	30.00
Knights of Pythias at Ancon	100.00
Knights of Pythias at Culebra	50.00
Knights of Pythias at Empire	50.00
Knights of Pythias at Las Cascadas	50.00
Knights of Pythias at Gorgona	50.00
Knights of Pythias at Cristobal	10.00
Pythian Sisters	15.00
Total	$1,694.12

DISPOSITION.

Sent to Mr. W. W. Warwick, August 25, 1911	$1,374.62
Postal money order in Mrs. Dennis' possession when she sailed	65.00
Cash in Mrs. Dennis' possession when she sailed	59.00
Other cash paid Mrs. Dennis	90.00
Hospital expenses of Mrs. Dennis, and other items	66.69
Balance in hands of treasurer, and to be collected	38.81
Total	$1,694.12

Mrs. Dennis and her six children were cared for by the Red Cross while in the Canal Zone; free transportation to the States was furnished them, and arrangements were made to have them cared for in Washington, until such time as Mrs. Dennis can procure a position. She was recommended to the superintendent of the State, War, and Navy building in Washington for a position as chorewoman. Her preference was to reside near Washington, and to that end, W. W Warwick and Ernest Daniels, the latter a Washington real estate man, have been appointed trustees for the purpose of investing about $1,200 in a house near Washington to be used by the family, but not to be sold until the youngest child is 18 years of age. Fifty dollars will be paid to Mrs. Dennis for the ensuing two months, and any balance remaining after the purchase of the house, will also be paid to her.

PERSONAL.

Mr. W. G. Comber left on the *Colon* on Tuesday, September 5, on his annual leave of absence in the States.

Public Installation by Ancon Kangaroos.

A public installation and dance was held by Ancon Court. No. 7, I. O. P. K. at Ancon hall on Saturday evening, August 26. The officers installed were: Judge, George H. Vogan, prosecuting attorney, X. D. Holt; defendant attorney, G. L. Griley; comptroller, H. H. Hammer; chaplain, A. S. Curtis; sheriff, Michael Dew. During the ceremony, music was furnished by an orchestra, and Miss McDonald sang two selections, accompanied by Mrs. Wallace on the piano. Refreshments were served.

United Spanish War Veterans.

A meeting of the United Spanish War Veterans will be held in the lodge hall at Culebra on September 10 at 2.30 p. m., when the camp charter will be opened.

On Saturday evening, September 9, the United Spanish War Veterans will give an entertainment and dance at the clubhouse in Gatun. The public is invited, especially those who have seen service in the army or navy.

Annual Meeting of Tivoli Club.

At the annual meeting of the Tivoli Club on August 27, the following officers were elected for the ensuing year: President, Dr. J. C. Perry; first vice-president, Col. J. P. Fyffe; second vice-president, Alban G. Snyder; secretary and treasurer, J. W. Tannehill; board of governors include the officers Tom M. Cooke, and A. S. Zinn. The membership committee consists of H. S. Hunter and W. K. Jackson. The report of the secretary and treasurer shows a cash balance of $1,497.47.

U. F. Co.'s Coastwise Service to be Resumed.

The coastwise service of the United Fruit Company between New Orleans and Colon, will be resumed with the sailing of the *Parismina* from New Orleans on Wednesday, September 13, and the sailing of the *Cartago* from Colon on Thursday, September 14. These ships stop on both outward and inward bound trips at Port Limon, Costa Rica, and Puerto Barrios, Guatemala.

W. G. Russell and James A. Daly, the highest bidders, have been awarded the contract for soliciting baggage on Panama railroad trains, and at stations, and for handling it at the terminals.

OILS AND GREASES.

Kind Used, Manner of Receiving and Distributing, Consumption and Use.

The number of lubricating, illuminating, and miscellaneous oils and greases received and standardized by the Commission and Panama railroad is 21, of which 10 are lubricating, two illuminating, four miscellaneous oils; and five are greases, including nonliquid oil.

Lubricants and oils are standardized, as follows: Valve, air compressor cylinder, marine, stationary, locomotive, turbine, and gas engine oils, crank case, car, transformer, lard, ammonia cylinder, and crude oil. Greases—nonliquid oil, cup, gear, cable, and crank pin grease. Illuminating—signal and kerosene oils. Gasoline.

Of the above mentioned oils, 12 are received by the Commission in 50-gallon steel drums, and three in cases of two 5-gallon cans each. Three kinds of greases are received in barrels, and two in 25-pound cans. Crude oil is supplied to the different points in containers convenient for the work required, drawn from crude oil tanks located on the Isthmus.

The approximate monthly consumption and use of each grade by the Commission and the Panama railroad is, as follows:

Valve oil, 5,350 gallons—For the internal lubrication of all steam valves and cylinders.

Air compressor cylinder oil, 150 gallons—For the internal lubrication of air cylinders of all compressors, pneumatic hammers, and drills.

Marine engine oil, 4,175 gallons—For use on marine engines and block bearings of suction dredges.

Stationary engine oil, 2,750 gallons—For the general lubrication of stationary engines and machinery, electric motors, and dynamos.

Locomotive engine oil, 3,850 gallons—For all locomotives, running gears of locomotive cranes, deck machinery of dredges, and for cold saws in machine shops.

Turbine engine oil, 400 gallons—For the step bearings of turbine engines in electric plants.

Gas engine oil, 150 gallons—For the cylinders of internal combustion engines.

Crank case oil, 100 gallons—For use in crank cases of Westinghouse vertical compound engines.

Car oil, 5,175 gallons—For the journals of rolling stock generally, steam shovel bearings, tripod drills, etc.

Transformer oil, 200 gallons—For use by the electrical divisions in oil-cooled transformers.

Lard oil, 50 gallons—Miscellaneous use.

Ammonia cylinder oil, 50 gallons—For the internal lubrication of cylinders of ammonia compressors.

Crude oil, 1,000 gallons—Used for the lubrication of steam shovel chains, and special designated uses.

Kerosene oil, 10,000 gallons—For illuminating and cleaning purposes.

Signal oil, 100 gallons—Used in railroad lanterns and cab lights of engines.

Gasoline, 3,350 gallons—For use on motor cars, launches, blow torches, cleaning, etc.

Nonliquid oil, 1,850 pounds—Used on Gatun cableways and air cylinders.

Cup grease, 6,000 pounds—For use in compression cups.

Gear grease, 6,175 pounds—For use on gears, center and side bearings, etc.

Cable grease, 1,000 pounds—Used on the Gatun cableways.

Crank pin grease, 40 pounds—For use on locomotive crank pins, equipped for the use of grease.

The various equipment on which the above oils and greases are used is, as follows:

Canal equipment—		
Steam shovels		100
Locomotives		385
Cars		5,880
Drills		560
Cranes		58
Unloaders		30
Spreaders		25
Track shifters		10
Pile drivers		20
Floating equipment—		
Dredges		20
Tugs		14
Clapets		11
Barges, lighters, and scows		83
Launches		14
Cutters		3
Pile drivers		2
Tow boat		1
Crane boat		1
Drill boats		2
Rock breaker		1
Plant equipment—		
Electric power plants		7
Hydraulic plant		1
Air compressor plants		3
Shops (machine and power)		9
Industrial railway:		
Locomotives, electric	8	
Cars	16	
		24
Automatic railway cars		45
Coal hoist		1
Cantilever cranes		5
Berm cranes		4
Cableways (Gatun), 6 double and 1 single		7
Rock crushers		2
Cold storage plant		1
Laundries		2
Bakery		1
Municipal pumping and condensing plants		15

Miscellaneous equipment—

Such as moter cars, road rollers, trucks, emergency steam, electric, and air pumps used in construction, relay pumps, emergency pumping stations, channellers, lighthouses, houseboats, and outlying points are supplied with illuminating oils.

Method of handling—All lubricants and oils are received at the general storehouse located at Mount Hope, and are distributed from there to the various division storehouses, including the Panama railroad and outlying depots to the number of 10, from which points they are supplied to the local oil houses, situated at places convenient to the work, whence they are issued in daily, weekly, and monthly quantities, as requisitioned on oil tickets, by employes in charge of the equipment or plant. Oils are delivered to the local oil houses in 50-gallon drums, which are used as distributors by the insertion of a faucet, and have a value to the Commission when returned to the contractor in good order.

All oiling equipment of the Commission and Panama railroad is standardized, as follows: Twenty-four-inch spring hand oilers, locomotive tallow pots, spring stationary engine oiler, squirt can, oil cans with screw covers and spout, of one, two, and five-gallon capacity.

All equipment and plants of the Commission and Panama railroad are placed on a monthly allowance, according to the particular necessities and nature of work performed by each. A monthly report is required of the consumption of each individual piece of equipment and plant, which shows service days, and a satisfactory explanation of amounts used in excess of the monthly allowance must be made. Monthly reports are posted at different places for the information of all concerned. All equipment and plants are furnished with standard oiling equipment and kept in good repair, and are supplied also with containers for oil drawn for future use.

Oiling systems and drip pans are installed where required, and where sufficient quantities of oils can be reclaimed, filters are furnished. When the reclaiming of oils through drip pans is not sufficient to warrant the installation of a filter, oil is filtered at a central station for reuse. Careful attention is given to every detail of the work in regard to the issuing, handling, and consumption of lubricants and oils, and instructions have been issued with reference to economical use

Pilots, Mates, Masters, Chauffeurs.

Examinations for pilots, mates, and masters; and for chauffeurs, will be held by the Board of Local Inspectors at Ancon on September 13.

LOST—In the streets of Colon, on the evening of September 1, a ribbon watch fob bearing Canal medal, double Elk emblem, silver mounting. Canal medal No. 3,382. Reward, if returned to post-office, Cristobal.

SOCIAL LIFE OF THE ZONE.

Church Work.

St. James' Protestant Episcopal church at Empire was dedicated on Sunday afternoon, August 20. The dedicatory service was read by the general missionary and the Rev. Jesse R. Bicknell preached the sermon. Special music was rendered by the choir. A small grant was made by the Church Missions building fund for the building, and the remainder was raised by the congregation. The building is completed, furnished, and paid for. The parish is a large one, extending through old and new Empire, Golden Green, and the neighboring native villages.

The altar society of the Roman Catholic church at Gorgona has discontinued its meetings until the first of October. During the past year, the society has maintained the organist at a weekly salary, taken charge of the cleaning of the church, purchased ornaments, and installed a lavatory in the building. The parish dates from the French occupation. The building was used by the Commission for a storehouse until, in response to a petition of the Roman Catholic residents of Gorgona, it was assigned for church services. Since that time, two years ago, it has been renovated, and is maintained by the congregation. In connection with the church, there is a small Sunday school of American children. In September, there will be confirmation in the church, when the Bishop of Panama will officiate.

Social Events.

The regular dances of the Las Cascadas club are held in the lodge hall on the second and fourth Thursday evenings in each month. Informal dances are held on the first and third Thursday evenings.

The Las Cascadas Euchre Club meets fortnightly on Tuesday afternoons at the homes of members. One evening in each month an informal card party and dance is held, when the husbands and friends of the members are invited.

The Canal Zone Chapter, Royal Arch Masons, held a dance and banquet in the Commission hotel at Las Cascadas on Saturday evening, August 19, in honor of their first anniversary. A special train brought members and their families from Paraiso and intermediate stations. Following the dance, which was held in the social hall, a banquet was served in the hotel dining room. Covers were laid for 150. The only chapter of Royal Arch Masons in Panama was organized at Las Cascadas on July 23, 1910, under a charter granted by the General Grand Chapter of Royal Arch Masons of the United States of America.

Girls' Sewing Club.

A girls' sewing club has been organized in Gorgona. The meetings will be held weekly on Friday afternoons at the homes of the members. The girls will learn plain sewing, hemming, stitching, and embroidery, under a directress. The initial meeting was held on Friday afternoon, September 1, at the home of Mrs. S. E Calvit.

Sons of Veterans.

All those desiring to become charter members of the Sons of Veterans of the war of 1861-65 are requested to send their names to Past Camp Commander C. M. Fairbanks, Tabernilla, who has an application for a camp charter.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The moving picture schedule for the week of September 11 to 16, follows: Monday night, Gorgona; Tuesday, Gatun; Wednesday, Cristobal; Thursday Culebra: Friday, Corozal; Saturday, Empire

CULEBRA.

The monthly high score in duckpins was made by Mr. Huttlemaier, 124. Mr. Driscoll won the high score in bigpins, 247.

The Hearons Sisters will give a return concert on Sunday evening, September 10, which will be open to the public.

The volleybal' tournament, with five teams entered; opened on Tuesday night, September 5. The Quartermaster's team played the Married Men. The Independents will meet the All Stars on Friday evening at 8 o'clock

The Cristobal bowling team took three games from Culebra on the home alleys on Saturday evening. September 2.

EMPIRE.

The following high scores were bowled during the past week: Duckpins—Pinney, 101, 101; Pulsifer, 106, 101; Coombs, 102; Dakin, 100, 122; McLeod, 102; Scull, 125. Tenpins—Anderson, 216; Davis, 205.

The league game bowled on the Empire alleys on Saturday, September 2, resulted in Empire winning three straight games. The scores were, as follows:

Empire.				Gatun.			
Parkis	167	193	214	Louner	125	144	157
Sawtelle	146	179	134	O'Meara	191	204	144
Drake	141	146	154	Chamberlain	136	146	147
Goolsby	168	147	136	Galloway	142	155	122
Giavelli	200	166	206	Barte	160	145	136
Total	822	831	844		754	794	706

The subject for discussion by the literary society for September 8 will be "The initiative, referendum, and recall."

GORGONA.

The Gorgona Health League met on Tuesday evening, August 29, and discussed eugenics, or race improvement as outlined in the hook on that subject recently sent out by the health league. The discussion was led by Mr. Swanson. This is the first of a series of discussions to be given under the auspices of the health league.

Thirty-five men have been enrolled in the gymnasium class. Apparatus work has been taken up, and will be continued for the remainder of the season.

The Hearons Sisters Concert Company will fill a return engagement on Saturday night, September 9.

The Gorgona boy scouts walked to Tabernilla on Sunday, August 22, and took an exploring trip from there. They found the lake near that place, and selected a camping site to be used at some future time.

The Isthmian bowling league series was opened on Saturday, September 2, with Gorgona at Camp Elliott, and Camp Elliott at Gorgona. The home team won three straight games at Camp Elliott. The scores at Gorgona were, as follows:

	1st game.	2nd game.	3d game.
Gorgona	776	785	737
Camp Elliott	751	757	768

GATUN.

The health league was organized on Tuesday night. Mr. Fomon was elected president, and Mr. Fitzpatrick, secretary.

Messrs. Weston and Glick of Cristobal furnished vocal and piano music at the moving picture show on Friday night.

There were 2,093 games bowled on the Gatun alleys during August. Twenty men rolled over 100 in duckpins. DePoorter and Wurster tied for high score in duckpins—score, 121. Wurster won the tie. Louner and Hodges tied in tenpins.

On September 11, two-men "ragtime" tournaments will be started in duck and tenpins. Prizes will be given the winners.

Gatun won two out of three games in the bowling league series with the Empire team at Gatun on Saturday, September 2. Scores, as follows:

Gatun	903	805	887
Empire	789	915	829

CRISTOBAL.

The standing of the teams in the bowling league tournament is, as follows:

	Won.	Lost	P. C.
Cristobal	6	0	1,000
Empire	4	2	666
Marines	4	2	666
Gorgona	2	4	333
Gatun	2	4	333
Culebra	0	6	000

On Wednesday night, August 27, at the meeting of the debating club, the question was "Resolved, that United States senators should be elected by direct vote of the people." The affirmative won. Attendance, 93.

Basketball practice will take place every Tuesday night. Volleyball will be played every Tuesday and Thursday afternoons at 5.30 o'clock. Regular gymnasium classes will be held on Monday and Thursday of each week at 7.45 p. m.

On Monday night there was a wrestling match in the gymnasium between Messrs. Walker and Antonio, the latter winning two falls in 8½ and 5 minutes, respectively.

Seventeen boys went on the outing to Old Panama on Labor Day.

Married.

CLARK-WILSON—At St. Luke's chapel in Ancon, on September 2, the Rev. J. R. Bicknell officiating, Jessie Sanderson, daughter of Mrs. Mary Sanderson Wilson of Norfolk county, Va., to Herbert C. Clark, M. D., of Philadelphia, Pa. Canal Zone residence, Ancon.

GIBSON-SEYMOUR—At Cristobal, on August 31, Edith M. Seymour of Petoskey, Mich., to Dr. William C. Gibson of Empire, the Rev. A. A. Nellis officiating. Canal Zone residence, Empire.

Rainfall from August 1 to 31, 1911, Inclusive.

OFFICIAL CIRCULARS.

Disbursing Officer.

CULEBRA, C. Z., August 29, 1911.

CIRCULAR No. 406:

The duties of Disbursing Officer on the Isthmus will be assumed by Mr. William M. Wood on September 1, 1911, to serve in that capacity during the absence of Mr. Edward J. Williams, on leave.

GEO. W. GOETHALS, *Chairman.*

Surcharge on Material and Labor at Marine Camp.

CULEBRA, C. Z., September 1, 1911.

CIRCULAR No. 169-J:

Effective this date, the same surcharge will apply on material and labor furnished the Marine Battalion at Camp Elliott as on material and labor furnished to divisions and departments of the Isthmian Canal Commission.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Acting Collector of Revenues.

ANCON, C. Z., August 21, 1911.

I have the honor to designate Mr. Arthur McGown, Deputy Collector of Revenues, as Acting Collector of Revenues during my absence in the States on leave, effective August 24, and request your approval of the same.

Very respectfully,
TOM M. COOKE, *Collector of Revenues.*

APPROVED: M. H. THATCHER,
Head of Department of Civil Administration.

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at the Hotel Tivoli, Ancon, C. Z., on Sunday, September 10, 1911, at 7.30 p. m. The program follows:

1. March—*Unter den Siegesbanner*.......Von Blon
2. Selection—*The Spring Maid*......... Reinhardt
3. Romance—*A Tale of Two Hearts*......Roberts
4. Overture—*Morning, Noon, and Night in Vienna*..Suppe
5. Waltz—*Casino Tanze*..............Gung'l
6. (*a*)—*Chicken Reel*..............Daly
   (*b*)—*Casey Jones*..............Newton
7. Flower song—*Sweet Summer Rose*.....Armand
8. Popular medley—*Remick's Hits*.........Lampe
9. March—*Napoleon's Last Charge*...........Paul

CHAS. E. JENNINGS, *Musical Director.*

The next concert will be given at Gorgona, C. Z., September 17, at 6 p. m.

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending September 13, 1911 (75th meridian time):

Date.	Low.	High.	Low.	High.	Low.
	A.M.	A.M.	A.M.	P.M.	P.M.
September 7		2 58	9.08	3.10	9.23

COMMISSARY DEPARTMENT.

The open hours at Culebra commissary are from 8 a. m. to 1 p. m., and from 3 p. m. to 7 p. m. All other commissaries are open from 8 a. m. to 1 p. m. and 3 p. m. to 7 p. m., with the exception of the Cristobal commissary, which is open from 8 a. m. to 12.30 p. m., and from 2 p. m. to 7 p. m.

Retail prices of cold storage provisions for the week beginning September 2.

FRESH MEATS.

	Price.
Mutton—Stewing, per pound	6
Shoulder, neck trimmed off, (4 pounds and over), per pound	9
Entire forequarter (not trimmed), 10 pounds and over, per pound	8
Leg (8 to 10 pounds), per pound	17
Cutlets, per pound	18
Short cut chops, per pound	20
Lamb—Stewing, per pound	6
Entire forequarter, neck trimmed off, per pound	9
Leg (5 to 8 pounds), per pound	20
Chops, per pound	24
Cutlets, per pound	24
Veal—Stewing, per pound	10
Shoulder, for roasting (not under 4 pounds), per pound	12½
Chops, shoulder, per pound	16
Chops, per pound	24
Loin, for roasting, per pound	24
Cutlets, per pound	28
Pork—Loin chops or roast, per pound	†18
Beef—Suet, per pound	2
Soup, per pound	5
Stew, per pound	8
Corned, No. 1, per pound	12
Corned, No. 2, per pound	10
Chuck roast (3 pounds and over), per pound	12
Pot roast, per pound	12½
Rib roast, second cut (not under 3½ pounds), per pound	16
Rib roast, first cut (not under 3 pounds), per pound	18
Sirloin roast, per pound	19
Rump roast, per pound	19
Porterhouse roast, per pound	20
Steak, chuck, per pound	12½
Round, per pound	13
Rib, per pound	18
Sirloin, per pound	19
Rump, per pound	19
Porterhouse (not less than 1½ pounds), per pound	20
Tenderloin (Western), per pound	24

MISCELLANEOUS.

Caviare, Russian, per tin	47, 89
Livers—Beef, per pound	7
Calf, each	60
Half, each	30
Steak, Hamburger, pkg	13
Sausage—Bologna, per pound	10
Frankfurter, per pound	12
Lleberwurst, per pound	10
Devonshire Farm	17
Sweetbread—Veal, per pound	1.20
Beef, per pound	25
Eggs, fresh, dozen	28
one-half dozen only	15
Bluefish, fresh, per pound	14
Halibut, fresh, per pound	15
Shads, fresh, each	70
Shad roes, fresh, per pair	35

POULTRY AND GAME.

Chickens—Fancy roasting, milk fed, large, each	1.25
Fancy roasting, milk fed, med., each	1.00
Fancy roasting, corn fed, about 4½ pounds, each	90
Fowls, each 60, 70, 80, 90,	1.00
Ducks, Western, about 4½ pounds, each	1.00
Broilers, milk fed, each	60
corn fed, each	55
Turkeys, per pound	26
Squabs, each	35
Capons, each	2.10
Fryers, corn fed, each	60
Partridges, each	50
Grouse, each	50

CURED AND PICKLED MEATS.

Ham—German, Westphalia, per pound	36
Sugar cured, per pound	18
Sliced, per pound	20
Half, for boiling, per pound	19
Boiled, per pound	26
Hocks, per pound	‡8
Bacon—Breakfast, whole piece, per pound	22
Breakfast, sliced, per pound	23
Pork, salt family, per pound	*13
Ox tongues, each	1.00
Pigs' feet, per pound	9
Tongues, per pound	18
Sliced bacon in 1-pound tins, per tin	30
In 1-pound jars, per jar	30

DAIRY PRODUCTS.

	Price.
Butter—Creamery special, per pound	32
Cheese—Roquefort, per pound	38
Philadelphia cream, cake	18
Young America, per pound	18
Swiss, per pound	26
Edam, each	1.00
Neufchatel, cake	6
Gouda, per pound	34
Milk (Certified), per bottle	**25
Buttermilk, bottle	**15
Ice cream, quart	‡25
½-gallon	‡50

VEGETABLES AND FRUITS.

Beets, per pound	*3
Celery, per head	6
Corn, green, per doz	24
Cabbage, per pound	*3
Cucumbers, per pound	3
Carrots, per pound	*4
Cauliflower, per pound	13
Lettuce, per pound	†12
Onions, per pound	*3½
Potatoes, white, per pound	*4
sweet, per pound	2
Pears, alligator, each	6
Peppers, green, per pound	7
Rhubarb, per pound	3
Turnips, per pound	4
Tomatoes, per pound	*4
Yams, per pound	3
Apples, per pound	10
Cantaloupes, each	8
Grapes, per pound	7
Lemons, dozen	24
Limes, per 100	80
Oranges, California, per dozen	42
Pears, per pound	8
Peaches, pound	*6
Plums, per pound	9
Watermelons, each	30

Supplies for Canal Work.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon, and Balboa, during the week ending September 2:

Venus, August 27, from Gulfport, with 10,544 pieces lumber for stock; 554 pieces piling for Atlantic Division.

Etonian, August 27, from Liverpool, with 200 barrels carbolic acid for stock.

Trent, August 27, from New York, with 13 bundles turnbuckles for stock.

Kansas City, August 28, from San Francisco, with 1,195 pieces redwood lumber and 650 pieces white oak lumber for Mechanical Division.

Atenas, August 31, from New Orleans, with 11 packages rock crusher parts and 230 pieces ties for Pacific Division; 48 bundles washers and 74 pieces piling for Atlantic Division; 198 pieces white oak lumber and 1,345 bundles siding lumber for Mechanical Division; 2,033 pieces yellow pine lumber, 308 bundles ceiling lumber, 1,573 bales hay, 2,728 sacks oats, 510 sacks bran, for stock.

Colon, September 1, from New York, with 10 pieces castings for Atlantic Division; 19 cases rubber boots and 92 bundles steel bars for Pacific Division; 6 cases steel, 5 cases copper wire, 14 barrels journal bearings, for Mechanical Division; 6 barrels crockery, 7 cases air hose and couplings, 18 barrels chipped soap, 10 cases envelopes, 40 pigs tin, for stock; and a miscellaneous cargo, the whole consisting of 282 packages, weighing 50 tons.

Almirante, September 1, from New York, with 88 barrels fire sand for Mechanical Division; 24 bales oakum for stock.

Misdirected Letters.

ANCON, C. Z., September 6, 1911.

The following insufficiently addressed letters, originating in the United States and its possesssion, have been received in the office of the Director of Posts, and may be secured upon request of the addressee:

Bean, Mrs. E. C.
Briggs, Ray
Browning, Robert F.
Brozile, Mrs. D. A.
Buchanan, Jonathan
Campbell, Capt. Otis F.
Du Maine, Alphonse (2)
Emery, Mrs. Mary
Hamilton, J. I.
Hayse, Dr. Harry
Klunk, Mrs. Charles
Lenerett, Hugh
Lewis, Lewis
Martin, Bernard
McKnight, John
Nelson, Elliott
Orza, Manuel
Peterson, G. C. (2dclass)
Ray, J. R.
Reese, Dr. Frederick
Rielley, H. I.
Robertson, Earnest
Spencer, Henry
Thompson, J. M.
Vreeland, W. K.

The following vessels arrived at, or departed from the port of Balboa during the week ending September 2:

Arrivals—August 28, *Kansas City*, from San Francisco; *Ucayali*, from Callao; August 29, *Ecuador*, from Guayaquil; August 30, *Chile*, from Guayaquil; *Aysen*, from Valparaiso; August 31, *Newport*, from San Francisco; September 2, *Pleiades*, from San Francisco.

Departures—August 28, *Oberon*, to Port Harford; *Guatemala*, to Callao; August 29, *Peru*, to Guayaquil; August 31, *Mackinaw*, to San Francisco.

MOVEMENT OF OCEAN VESSELS.

The following is a list of the sailings of the Panama Railroad Steamship Company; of the Royal Mail Steam Packet Company; of the Hamburg-American Line, and of the United Fruit Company's Line; the Panama Railroad Company's dates being subject to change.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Joachim* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct leave on Thursdays at 3 p. m.; ships for New Orleans in the coastwise service on Thursdays at 4 p.m.; ships for New York via Kingston on Thursdays at 11 a. m.: for Bocas del Toro on Mondays at 6 p. m

The Leyland line steamer *Louisianian* sails for New Orleans direct on or about September 28.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, SEPTEMBER 13, 1911. No. 3.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Unloading Dock for Dynamite at Mindi.

A wharf, 130 feet long and 20 feet wide, will be built along the old French canal at Mindi, near the crossing of the American Canal, at which dynamite ships will tie up for unloading. Up to the present time, dynamite ships have unloaded at the only available place, the docks at Mount Hope, and although no accidents have occurred since the first shipment arrived in 1904, there is always danger of an explosion which might wreck the shipping in the harbor, and do considerable damage in Colon and Cristobal. The point at which the new dock will be constructed is about two miles north of Gatun, and four miles south of Cristobal, and an explosion at this point would. therefore, do less damage. It will be necessary to dredge about 27,000 cubic yards of material in the old French canal as an approach to the dock. Ships containing dynamite will pass up the American Canal direct to the new dock. The railroad already in use in hauling spoil from the excavation pit at Mindi will be available for the dynamite trains. It is estimated that about 15,000,000 pounds of dynamite remain to be unloaded before the Canal is completed.

Canal Work in August.

The grand total of Canal excavation to September 1 was 148,192,759 cubic yards, leaving to be excavated 47,130,620 cubic yards, or less than one-fourth of the entire amount for the completed Canal.

The total for August was 2,706,223 cubic yards, as compared with 2,813,462 cubic yards in August, 1910, and 2,755,178 cubic yards in August, 1909. All the excavation was "work excavation," there being no "plant excavation."

The dry excavation amounted to 1,698,554 cubic yards, and was principally by steam shovels. The dredges removed 847,771 cubic yards, and 159,898 cubic yards were sluiced, in addition to the amount pumped into Gatun Dam by suction dredges. The progress on the locks at Gatun, Pedro Miguel, and Miraflores is referred to elsewhere in this issue.

In the Atlantic Division, the total excavation was 455,055 cubic yards. Of this total, 87,599 cubic yards were dry excavation, and the remainder was removed by the dredges in the Atlantic entrance.

The total excavation in the Central Division was 1,464,294 cubic yards, all of which was from the prism. The amount taken from Culebra Cut was 1,442,402 cubic yards, the greatest excavation for a rainy season month in the history of the Cut.

In the Pacific Division, the total excavation was 786,874 cubic yards, 480,315 cubic yards of which were taken out by the dredges at the Pacific entrance, and 149,926 by the hydraulic excavation plant working immediately below Miraflores Locks.

A detailed statement of the excavation, and a summary of the work on the locks and dams, follow:

ATLANTIC DIVISION.

LOCALITY.	"Work." Excavation.	"Plant." Excavation.	Total excavation.

COST OF CONCRETE.

Statement of Operations for the Fiscal Year 1910-11.

The total amount of concrete laid during the fiscal year 1910-1911 was 1,742,928 cubic yards. There were laid in the Atlantic Division 970,788 cubic yards, of which 59,651 cubic yards were laid in the Spillway, and 911 137 cubic yards in the locks. In the Central Division, there was laid in connection with the flume constructed for the Obispo diversion 1,020 cubic yards. In the Pacific Division, 771,120 cubic yards were laid, of which 498,187 cubic yards were placed in the Pedro Miguel Locks, and 272,933 cubic yards were placed in the Miraflores Locks. In laying concrete for the locks in the Atlantic Division, the construction plant was operated on the basis of a 12-hour day, and the auxiliary plant on the basis of a 9-hour day, with the exception of a short period between September and November. In the Pacific Division, the work has been done on the basis of an 8-hour day. Taking into consideration the service time of hours at work, it is ascertained that the Atlantic Division laid 237.05 cubic yards per hour, and the Pacific Division, 352.67 cubic yards per hour. The cost per cubic yard for concrete in the Gatun Locks was $6.5919; in the Gatun Spillway, $6.7044; in the Pedro Miguel Locks, $4.7040 per cubic yard; and in the Miraflores Locks, $4.6826. At Gatun, 73,609 cubic yards of large rock were used resulting in a saving of $263,137.45, or of 0.2888 cents per cubic yard on each yard of material placed.

In the production of stone for the concrete, the cost in bins at Gatun was $2.3403 per cubic yard, and in the storage pile for the locks on the Pacific side, $0.8443 per cubic yard. Sand was procured at Nombre de Dios for concrete in the Atlantic Division, and cost $1.8565 per cubic yard in storage. Sand for the locks on the Pacific side was secured at Chamé and cost, in storage, $0.8284 per cubic yard. Crushed stone from Porto Bello is transported to Gatun in barges, and unloaded by cableways and derricks, while crushed rock from Ancon is transported from the quarry by rail to storage, and dumped from trestles. The difference between the cost of towing and unloading, and that of transporting by rail, is $0.7184 per cubic yard. If this be deducted from the actual cost in storage, it leaves a cost of $1.6219 per cubic yard for Porto Bello stone at Gatun, as against $0.8443 for stone for the locks on the Pacific side. The haul for sand from Nombre de Dios is 40 miles, while from Chamé it is 20 miles. The Atlantic Division used cableways and cranes for unloading the sand, while the Pacific Division used electric cranes. Omitting the cost of transportation from the sand banks to the docks, the cost to the Atlantic Division was $1.3142 per cubic yard, and to the Pacific Division $0.6015 per cubic yard. Cement for the large part is delivered in barrels to the Atlantic Division at a cost of $1.19 at tide water in the United States, while in the Pacific Division, it is delivered in bags at a cost of $1.60 at tide water in the United States per barrel, less credit for return of bags. As approximately 90 per cent of the bags were returned and accepted, the cement in bags cost $1.01 per barrel at tide water in the United States.

The construction plant in the Pacific Division handles a large percentage of its cement directly from cars to mixers resulting in reduced rates, whereas nearly all the cement in the Atlantic Division is handled through its storehouse. The year's operations show a difference in favor of the Pedro Miguel Locks of $1.7340 in the cost of cement, sand and stone, and large rock; in the other items which go to make up the cost of the finished product, the Pedro Miguel Locks show a lower cost for forms, placing, pumping, power, repairs, plant arbitrary, and in division expenses, while a difference exists in favor of the Atlantic Division in mixing and reinforcement. The construction plant at Pedro Miguel was in operation in its entirety from the 15th of July to the 1st of February, and a comparison of the costs for the 6 months' period, with the costs at Gatun for the year, show less costs at Pedro Miguel for all items, except for reinforcement.

In the item of mixing, the Pedro Miguel construction plant shows a cost of $0.1334, while at Gatun, the cost by the construction plant was $0.1749 per cubic yard.

Examination of the costs of the work shows also that the amount paid for salaries of clerks, and for supervisory forces, was 26.05 per cent in the Atlantic Division, and 22.95 per cent in the Pacific Division.

Survey for Penitentiary Farm.

A survey has been authorized of some land owned by the Government in the valley and low hills east of Pedro Miguel, to determine its availability for a reservation of about 450 acres for a prison farm. It is expected that, ultimately, the penitentiary, now situated in Culebra on the edge of Culebra Cut, will be moved to this or a similar reservation. The tract in question is near the relocated line of the Panama railroad and the Canal Zone highway.

Land Survey.

Field work on the Canal Zone land survey has been completed, and the data is being collated in the office of the Third Division of the Chief Engineer's office at Culebra. Data have been procured for a general topographical map of all the Zone, except the land that will be covered by water of Gatun and Miraflores lakes. All the principal ridges, watercourses, and trails, have been located and surveyed.

The survey was made under the provisions of an Act of Congress of June, 1910, in which $75,000 was appropriated for this purpose. The object was to make such maps as would enable the Commission to issue leases to Government lands under the provisions of the land law of February 29, 1909. The intention was to make a section survey, dividing the territory covered into sections of two kilometers square, with reference to a principal meridian established at Balboa Hill, near Gorgona, and a parallel passing through the same point. Work in the southeast quadrant developed the fact that such a survey would be of little value, because of the rugged topography, and the fact that much of the land, heretofore considered Government land under the original grant of commons to the city of Panama, is claimed by various people under prescriptive titles. The lines of the estates, so claimed, are referred to ridge tops, watercourses, and trails. The plan was, therefore, changed to a general topographical survey, and the resulting maps will show not only the nature of the country, but also the principal physical features to which many of the claims of prescriptive titles are referred.

CONCRETE WORK IN THE LOCKS.

Over 64 per cent of the concrete for all the locks is in place, the amount at the close of the work on September 9, being 2,701,148½ cubic yards, out of a total of approximately 4,199,400. A total of 26,140½ cubic yards of concrete was laid in the locks during the week ending September 9.

GATUN LOCKS.

Over 79 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on September 9, being 1,582,964½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending September 9, and of the total, follows; and a similar statement for the work in the Spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers			Large stone.	Total.

ORDINANCE

Providing for the Impounding of Stray Animals.

Be it enacted by the Isthmian Canal Commission, that the ordinance providing for the impounding of stray animals enacted by said Commission at its 143d meeting, held on April 27, 1908, and approved by the Secretary of War on May 26, 1908, be, and the same is hereby amended and reenacted in form, as follows:

1. It shall be unlawful for the owner or custodian of any horse, colt, mule, ass, bull, steer, cow, calf, hog goat, or sheep, to permit any such animal to be at large within, or in the neighborhood of any labor camp, village, or other settlement in the Canal Zone, or on any watershed, from which any public water supply is obtained, or to be staked or tethered in such place, or in such manner, as to be, or create, a nuisance within, or in the neighborhood of any labor camp, village, or other settlement, or on any watershed.

2 Any animal found at large or tethered contrary to the provisions of the first section hereof shall be taken up and impounded by the police: *Provided*, that any such animal may be taken up by any private individual and delivered to the police for impounding. It shall be unlawful for any person to deliver to the police for impounding any animal other than an animal found at large or tethered contrary to the provisions of the first section hereof.

3. Notice of the impounding of any animal shall be posted by the police in two conspicuous places in the police district in which such animal is impounded, for ten days, including the day upon which the animal is impounded. Such notice shall contain a description of the animal, and shall state where it is impounded, and to whom application should be made for its release. It shall also state that if previous application for the release of the animal is not made, it will be sold before the police station on the tenth day from, and including the day on which it is impounded, at an hour to be stated in the notice.

It shall be unlawful for any person other than the owner or custodian, or agent of the owner or custodian, to secure the release of any impounded animal

4. If application for the release of any impounded animal is not made within eight days from, and including, the date of its impounding, the police shall make application to the district judge of the district for authority for its sale. If it shall appear to the judge that the provisions of this ordinance have been complied with, and that the animal has not been claimed by the owner or custodian, he shall enter an order authorizing its sale at public cry before the police station of the police district in which it is impounded at the time stated in the notice of impounding posted by the police The police shall, thereupon sell the animal at the hour and place stated, to the highest bidder, for cash

5 For each horse, colt mule, ass, bull, or cow impounded there shall be collected one dollar, as a pound fee, and fifty cents per day as a maintenance charge; and for each calf hog, goat, or sheep fifty cents as a pound fee, and twenty-five cents per day as a maintenance charge.

Before the release of any animal to the owner or custodian the proper fees and charges shall be collected from him Upon the sale of any animal under an order of court the court costs shall be deducted from the amount for which the animal is sold, and paid over to the district judge. All amounts collected by the police from the owner or custodian of any impounded animal or from its sale, after paying the costs of court, shall be remitted to the treasurer of the Canal Zone as Zone revenues. There shall be returned to the owner or custodian of any animal sold under the provisions of this ordinance, upon application therefor made, at any time within one year from the date of such sale the amount for which the animal was sold less the pound fees and charges and costs of court.

6. If any impounded animal is suffering from any infectious or contagious disease, or from any disease or injury causing great pain, or is without value, or if no bid is received for any impounded animal offered for sale, the police shall immediately make application to the district judge for authority to destroy it, and the judge shall, if he is satisfied of the facts as stated, enter an order authorizing its destruction.

7. The cost of constructing pounds and feeding impounded animals shall be paid from Canal Zone funds.

8. Any person violating any provision of this ordinance shall be guilty of a misdemeanor, and on conviction thereof, shall be fined not more than twenty-five dollars, or imprisoned not longer than thirty days or both fined and imprisoned, in the discretion of the court.

9. This ordinance supersedes and repeals the provisions of any ordinance, regulation, or law in force in the Canal Zone prohibiting persons from permitting animals to run at large, or providing for impounding such animals, and the provisions of any other ordinance, regulation, or law in force in the Canal Zone in conflict with it.

Enacted by the Isthmian Canal Commission, August 5, 1911.

Approved by the Secretary of War, August 22, 1911.

Opening of Public Schools.

The Superintendent of Schools announces that the public schools of the Canal Zone will open on Monday, October 2, at 9 a. m. All children of the Canal Zone, whether of employes or nonemployes, and all nonresident children of employes of the Isthmian Canal Commission, are entitled to free school privileges. No child will be admitted however, who will not be six years old on or before February 1, 1912.

Schools for white children will be opened at Ancon, Pedro Miguel, Paraiso, Culebra, Empire, Bas Obispo, Gorgona, Gatun, and Cristobal. Schools for colored children will be opened at Miraflores, Pedro Miguel, Paraiso, Cucaracha, Culebra, Empire, Mandingo, Matachin, Gorgona Gatun, Mount Hope, Cristobal, Marajal, Cruces.

Requests should be made to the Superintendent of Schools, Ancon, immediately, for railroad transportation for white children living in communities where schools or brake service are not provided.

The teaching force will be composed of 43 white, and 24 colored and native teachers, and there will be two supervisors, in addition to the superintendent. Music will be continued under the direction of the leader of the Commission band.

The school for colored children at Marajal, a native village on the Escondido River, across Manzanillo Bay from Colon, will be conducted in the Catholic church by a native teacher, who speaks both Spanish and English. There are about 75 children of school age in the settlement, and about 35 of these are expected to attend. The new school at Mandingo, near Las Cascadas, will be held in a remodeled building. There are [illegible]5 children of school age in the settlement. The schools at Cucaracha and Miraflores will be held in refitted French buildings. The teaching of gardening to the colored children will be continued. It is planned to add a hectare of land to the Empire school garden, and some citrus trees will be set out.

Ancon Rock Crusher.

A statement of the rock crushed at Ancon quarry during the weeks ending September 2 and 9, follows:

DATE.	Hours worked.	Cubic Yards.

September 9	7.00	2,360
Total	37.35	12,136

Missing Men.

Any one having information regarding the present whereabouts of Frederick T Harris, who left the service of the Isthmian Canal Commission on April 18, 1910, is requested to communicate with the American Legation, Panama.

Any one having information regarding the whereabouts of the following named men, who are supposed to have come to the Isthmus of Panama, are requested to communicate with THE CANAL RECORD, Ancon, C. Z.: A. A. Ramsey, H. B. Start, George Payne, and Thomas G. Gurish.

Lectures on Health.

More than five hundred persons attended the illustrated lecture on tuberculosis held in the large hall on the corner of Cash and D streets, Colon, on Thursday evening, August 31. The lectures are given under the auspices of the Cristobal Woman's Club, and are free to any who wish to attend. The success of the series has been so marked that the organizers will ask the cooperation of the Canal Zone Federation of Women's Clubs, and the different local organizations in the Canal Zone, to arrange for similar lectures in the American villages. Each of the Commission clubhouses has the equipment necessary for the exhibit of the lantern slides, and any club which will guarantee the small expenses incidental to the transportation of the slides and the machine, will be welcome to the use of them. Lectures are being prepared in Spanish and in French, with a view to reaching the natives and the French speaking people. The next lecture will be on the typhoid germ and the danger of the house fly.

The steamship *Cristobal* will sail from pier No. 11, Cristobal, for New York, on Sunday, September 17, at 4 p. m.

NEW EXCAVATION ESTIMATE.

Grand Total for the Entire Canal Placed at 195,323,379 Cubic Yards.

The statement of Canal excavation, published in this issue of THE CANAL RECORD, contains a new estimate of the amount of material yet to be removed in each of the construction divisions, the total increase being 12,785,613 cubic yards over the estimate of July, 1910, raising the total estimated excavation for the entire Canal to 195,323,379 cubic yards. This addition will not increase the estimated cost, as determined in December, 1908, nor affect the time of completion, because the cost per cubic yard has decreased, and the capacity per excavating unit has increased, as the work has advanced.

In the Central Division, there have been added 5,257,281 cubic yards to allow for slides in Culebra Cut, while a deduction of 581,003 cubic yards has been made from the estimated excavation at other points. The net addition to this division is therefore, 4,676,278 cubic yards. The new estimates for the Atlantic and Pacific Divisions include additional excavation, due to the silting in the Atlantic and Pacific entrances, to small slides that have developed in the Canal banks, and to minor changes. A statement of the original estimate of December, 1908, and the revised estimates of July 1, 1910, and September 1, 1911, follows:

DIVISIONS.	1908.	1910.	1911.
Atlantic—	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*
Wet	33,515,399	35,084,291	38,727,675

Total	41,794,791	42,055,403	46,294,261
Grand total	174,666,594	182,537,766	195,323,379

A statement of the amount of excavation already done in each division, and the amount remaining will be found in the table on the fourth page of this issue.

Material for the Locks.

New bids have been requested for 127,000 linear feet of copper conductor bars, with copper splice bars, to be used to transmit electrical energy to the towing locomotives at the locks. The new advertisement is due to the fact that no satisfactory bids were received on the former advertisement The bars must be manufactured from pure copper ingots by rolling, drawing, or by the extrusion process. The splice bars must be pure rolled or drawn copper, having a burnished finish. The amounts specified may be increased by 50 per cent, or decreased by 25 per cent, at the option of the Commission.

The first shipment of steel "T" conductor rails for use on the towing tracks at the locks, and of steel cross-ties for the towing tracks, has been received. Specifications for the electric towing locomotives have been forwarded to the Washington office, in order that bids may be procured on this equipment.

Advertisement has been made for 1,500,000 feet of square vitrified duct, to be used in the electric conduit system of the operating tunnels of the locks. The opening in the duct must be 3½ inches square, and the outside dimensions must be not less than 4 7-8, nor more than 5 inches. The bulk of the material is to be in 18-inch lengths, with two per cent of shorter lengths.

Culebra Cut Slides.

Steam shovels have been set at work on the slide back of the division office at Empire excavating the material that has moved into Culebra Cut. This slide is unique in that a ridge, or steep side of the bank, moved toward the prism from the back, and both sides at apparently one time. It is estimated that three hundred thousand cubic yards of material are comprised within the slide, although an accurate estimate is impossible, owing to the fact that the depth of the moving mass cannot be ascertained.

At Cucaracha village, south of the big Cucaracha slide, a flat section of earth has begun to move toward the Canal. The break extends back 100 yards from the 95-foot berm, and is about 100 yards long on the face. The unknown depth of the mass makes a careful estimate impossible here also, but it is believed that about 150,000 cubic yards are in motion.

So far as interference with the excavation work is concerned, the slides in Culebra Cut are in more satisfactory condition than during any September since 1907. The total amount in slides represents about one-fourth of the material yet to be removed from Culebra Cut.

PERSONAL.

Mr. A. B. Nichols left for his annual leave in the States on the *Colon*, which left Cristobal on September 5.

Mr. James C. Courts, Clerk of the House Committee on Appropriations, with his daughter, arrived on the *Cristobal* on September 7. While on the Isthmus, Mr. Courts will assist in preparing the annual estimates for the Isthmian Canal Commission.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is about 69 per cent completed, 154,570 cubic yards, out of a total of 225,000, having been placed at the close of work on September 9. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
September 4 (holiday)	....	....	....
September 5	172	16.00	2
September 6	164	10.30	2
September 7	160	8.00	1
September 8	118	6.30	1
September 9	148	8.00	2
Total	162	49.00	1.60
Previously reported	153,808		
Grand total	154,570		

Organization of a Rifle Club.

There will be a meeting in the Ancon lodge hall on Sunday, September 17, at 10 a. m., for the purpose of organizing a rifle and pistol club, to be affiliated with the National Rifle Association of America. All citizens of the United States residing in Ancon and Corozal, who are interested, are invited to attend.

Balboa Dock Construction.

Forty of the 53 caissons for the new Panama railroad dock at Balboa are under construction, [illegible]5 have been sunk to bed rock, and 12 have been filled with concrete to the desired point, namely, 10 feet below sea level. It is expected that the work of placing the girders for the superstructure will be started within the next two weeks. The work schedule of July 17, which provided for day and night shifts, is still in effect. The men on the night force are mostly engaged in excavating for the caissons, the concrete work being carried on only in the daylight hours. A force is also kept on the work Sundays.

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher by days, for the week ending September 9, follows:

DATE.	Hours worked.	Cubic Yards.
September 4 (Holiday)	....	....
September 5	4.03	1,565
September 6	4.30	1,677
September 7	5.15	1,938
September 8	5.46	2,186
September 8th	4.11	1,603
Total	23.45	8,969

Work of Unloaders in Central Division.

The following statement shows the number of Lidgerwood cars unloaded by the Central Division during the month of August, 1911:

LOCATION.	No. of unloaders.	No. of trains.	No. of cars.
Balboa	3	1,062	21,240
Miraflores	3	784	15,680
Gamboa	4	1,172	24,610
Total	10	3,018	61,530

Married.

BENSON–MITCHELL—On the 8th of September, in Cristobal, Robey W. Benson of Baltimore, Md., to Carolyn A. Mitchell of Hamilton, Md., the Rev. Carl H. Elliott officiating. Canal Zone residence, Cristobal.

BOWES–BOWSER—On the 11th of September in the I. C. C. chapel, Cristobal, George Lester Bowes to Alice Jane Bowser, both of Lock Haven, Pa., the Rev. Carl H. Elliott officiating. Canal Zone residence, San Pablo.

WIKINGSTAD–HOLDEN—On the 11th of September in Cristobal, Knut Mathias Wikingstad of Brooklyn, N. Y., to Anna Maria Holden of Christianson, Norway, the Rev. Carl H. Elliott officiating. Canal Zone residence, Cristobal.

ELDER–GEER—In the Commission chapel, Cristobal, on July 11, Garnet Geer to Ralph Elder, the Rev. Carl H. Elliott officiating. Canal Zone residence, Cristobal.

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Gorgona, C. Z., on Sunday, September 17, 1911, at 6 p. m. The program follows:

1. March—*Ideal*........................Reeves
2. Selection—*The Dollar Princess* (by request)..Fall
3. Intermezzo—*Elegante from Tales of Hoffman* (by request)....Offenbach
4. Overture—*Morning, Noon, and Night in Vienna*......Suppe
5. Flower song—*Hearts and Flowers* (by request)........Tobani
6. Waltz—*Casino Tanze*....................Gung'l
7. Serenade—*La Paloma* (by request)......Yradier
8. Popular medley—*Remick's Hits*.........Lampe
9. March—*Unter den Siegesbanner*........Von Blon

CHARLES E. JENNINGS, *Musical Director.*

The next concert will be given at Empire, C. Z., on September 24 at 6 p. m.

SOCIAL LIFE OF THE ZONE.

Women's Clubs—Plans for the Club Year.

A meeting of the executive board of the Canal Zone Federation of Women's Clubs was held at Cristobal on Friday afternoon, September 8, when plans for the club year were discussed, and arrangements for the annual meeting in January were made. The sale of the cook book has been completed with a profit of about $50, which has been added to the club treasury. The librarian reported the progress of work with the juvenile library, which is now in Gorgona. The board authorized the enlargement of the art collection. This collection, which is handled by the librarian, has already been exhibited at one of the schools, and it will be offered as a traveling exhibit to be shown at any of the public schools in the Zone during the school year. A committee was appointed to take charge of the purchase of the usual Christmas gifts for the inmates of the leper colony. A supply of pins will be ordered, and members of the federated clubs will be able to purchase these from the treasurer at, or before, the annual meeting.

The January meeting will be held at Cristobal on the 20th or 27th, and will be in two sessions—the business meeting, with election of officers, in the morning; and the program meeting, with addresses and a reception, in the afternoon.

The Cristobal Woman's Club will resume meetings after the four months' recess on Wednesday afternoon, September 27, when there will be a general reception to the outgoing and incoming officers. Following this, the meetings will be held semimonthly, as usual. The work of the committees for the year is outlined, as follows: The seven meetings of the art and literature department will be devoted to the study of paintings and masters, folk song, and folk lore. Mrs. R W. Hart is chairman. The home department, with Mrs. Edward Beverly as chairman, will study home life in Switzerland, England, and Japan. The department will also have charge of three programs for the general meetings of the club, and will have one lecture on the history of furniture and rugs, and one on modern domestic science. There will be other addresses on education and the child, women in philanthropy, modern tendencies toward the preservation of life and health. Among the speakers will be Miss Alice Alexander, the Rev. Carl H. Elliott, Judge Thomas E. Brown Jr., and Dr. A. J. Orenstein. The meetings of the club are, as follows: A general meeting with program on the first Wednesday in each month, meeting of the home department on the second Wednesday, art and literature department on the third Wednesday; and a meeting of the executive board on the fourth Wednesday. The officers for the year are: President, Mrs. Carl H. Elliott; first vice-president, Mrs. Thomas E. Brown, Jr.; second vice-president, Mrs. E. H. Colip; recording secretary, Mrs. Max Culbertson; corresponding secretary, Mrs. Charles Butters; treasurer, Mrs. Fred Guderian. Mrs. R. G. Whittaker is chairman of the educational department, and Mrs. L. E. Willson chairman of the philanthropy department. The house and social committees have as chairmen, Mrs Webster Morris and Mrs. E. K. Turner. Mrs. William H. Bell is chairman of the special committee on the free educative lectures on tuberculosis.

The meetings of the Gatun Woman's Club will be resumed on September 27. During the absence of the president, Mrs. W. H. Martin, the first vice-president, will act in her place. The plans for the work of the club will be given at the first meeting.

The Empire Woman's Club held its first meeting with the study of China and India, on Thursday afternoon, September 7. The work is outlined to continue through the year.

The Paraiso Woman's Club resumed its regular meeting on Wednesday afternoon, September 6. The club will continue to work along the lines of last year. The meetings will be held on the first and third Wednesday afternoons in each month. Efforts will be made to continue the social side by giving entertainments from time to time. Current events will be a part of the program of each meeting. The following officers were elected: President, Mrs. C. E. Hennigh; vice-president, Mrs. H. Bain; secretary, Mrs. E. H. Coutermarsh; treasurer, Mrs. George Ruggles.

Church Notes.

The annual meeting of the Woman's Foreign Missionary Society of the Methodist Episcopal church of the city of Panama was held at the home of Mrs. E. H. Keyser on Thursday afternoon, September 7. The society welcomed Mrs. Harry Compton, the wife of the pastor of the church, who arrived on the Isthmus, with her daughter, on the *Colon* on August 31. A special program of vocal and instrumental music was given. The officers elected are: President, Mrs. Compton; vice-president, Mrs. J. H. Stokoe; secretary, Miss Elsie Keyser; treasurer, Mrs. Walter Bray, with the additional duty of treasurer of the mite boxes. At the next meeting, which will be held at the parsonage on the sea wall on Thursday, October 5, the study of the new text book, "The light of the world," will be begun. This is the third book that has been taken up by the society. The study work was begun in October, 1909.

Mrs. Compton will have charge of the Methodist college on the sea wall, Panama. She will begin her duties this month, and will prepare for the extension of the work in October, when classes will be established in domestic science for girls, and in manual training for boys. The monthly communion service will be held in the Methodist church on the first Sunday in October.

The Ladies' Aid Society of the Cristobal Christian League held its meeting at the home of the Rev. Carl H. Elliott on Thursday, September 7. The society is engaged in the systematic study of missionary work in foreign fields.

The Rev. Henry Haigh, president of the Wesleyan Methodist Conference, accompanied by Mrs. Haigh and their daughter, and Miss Hodson Smith, left England on August 2 for a tour of the mission stations of the church in the West Indies, British Guiana, and the Isthmus of Panama. They were accompanied by the Rev. Hodson Smith, the Rev. J H. Moulton of Didsbury College, Manchester, and Mr. Henry Bisseker of Birmingham. The party arrived in Colon on September 4, and public meetings were held in honor of the president, both in Panama and Colon. They sailed on September 5 for Jamaica for a two weeks' stay, and will proceed to Toronto, Canada, to attend the meetings of the Methodist Ecumenical Conference.

The Rev. Jesse R. Bicknell, chaplain at Ancon Hospital and the Protestant chapel, sailed on the *Colon* on September 5, to return to his former post as assistant priest at St. Paul's mission church, Baltimore Major Henry A. Brown, chaplain, Engineer Corps U. S. A., has been appointed in his place. The Episcopal church services at Trinity mission, Culebra, will be discontinued for the present.

Red Cross Endowment and Finances.

The following committee was appointed by Miss Mabel Boardman of the executive committee of the American National Red Cross, some months ago, to raise the sum of $700, to be contributed by the Canal Zone Chapter, for the Endowment Fund of the American National Red Cross. The committee has completed its labors, and, on September 9, the sum of $709.63 was forwarded to the headquarters of the American National Red Cross at Washington. The committee gave various entertainments, and, with the assistance of the members of the Canal Zone Chapter, its efforts have met with success:

Dr. A. J. Orenstein, Ancon; Alexander P. Crary Corozal; J. T. Smith, Pedro Miguel; Edw. Schildhauer, Culebra; T. L. Clear, Empire; J. B. Fields, Las Cascadas; W. B. Wheeler, Bas Obispo; B. M. Litt, Gorgona; Dr. Geo. H. Gorham, Tabernilla; Major Chester Harding, Gatun; Wm. F. Bennyhoff, Cristobal.

The financial statement of the Canal Zone Chapter, American National Red Cross, for the month of August, follows:

RECEIPTS.		
August 1, On hand		$3,101.19
August 3, Return of amount loaned to Spaniard who went to Cuba — See June statement	32.95	
August 18, Return of amount loaned the Baptist minister at Colon—See P. R. R. bill, 3,389	30.00	
August 31, Membership dues during August	10.00	
Total receipts		$3,174.14
DISBURSEMENTS.		
August 14, Relief of a family of a conductor at Empire..	30.00	
August 19, Advance for expenses of sending the three Besley children from Tabernilla to their home in Jamaica	25.00	
August 21. Relief of destitute dentist at Las Cascadas	40.00	
Total disbursements		$ 95.00
August 31, Balance on hand		$3,079.14

Approved: JOHN L. PHILLIPS, *Treasurer.*
C. A. DEVOL, *Chairman.*

Specimens of fossils collected by the Commission geologist have been sent to the Smithsonian Institution, where they will be identified by W. H. Dall, the authority on tertiary fossils. The specimens are early tertiary fossils, some of which belong to the oligocene, and they will be identified for reference to the subdivisions of middle and late tertiary times.

Paper sanitary drinking cups have been placed in the coaches of the Panama railroad, and the common cup has been abolished. The cups are also on sale at the commissary stores for five cents a dozen.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

Following is the schedule for the moving picture entertainments for the week of September 18 to 23: Monday, Gatun; Tuesday, Cristobal; Wednesday, Gorgona; Thursday, Corozal; Friday, Empire; Saturday, Culebra.

Following is the standing of the Isthmian bowling league tournament, now in progress:

	Won.	Lost.	P. C.
Cristobal	8	4	.667
Empire	8	4	.667
Marines	7	5	.583
Gorgona	6	6	.500
Gatun	5	7	.416
Culebra	3	9	.333

CULEBRA.

The gymnasium class meets every Wednesday evening, and will be followed by basketball.

The following are the results of the league games bowled at Culebra with the Marines from Camp Elliott:

Culebra.				Camp Elliott.			
Leylander	103		184	McDowell	133	163	144
Bronson	137	120		Austin	187	160	142
Huttlemaier	167	160	183	Meyers	116	134	145
Fleishman	164	137	162	Clause	171	152	117
Sickler	136	156	184	Martins	117	149	160
Wheeler		139	125				
Total	707	718	838		724	758	708

At Camp Elliott, Culebra took two out of three games. The following high scores were rolled in duckpins during the week: Huttlemaier, 105, 110, 114, 126; Mitchell, 106, 108.

EMPIRE.

The following scores of 200, or over, were bowled, during the past week: Tenpins—Pinney, 204, 204; Parkis, 214, 202, 202; Huson, 203, 223; Goolsby, 201, 201. Duckpins—Dakin, 104, 100; Rodeghiero, 102, 131

The league game bowled on the Empire alleys on Saturday, September 9, resulted in Empire winning two out of three games from Cristobal. The scores were, as follows:

Empire.				Cristobal.			
Sawtelle	180	181	153	Barrett	155	138	134
Spinks	193	186	146	Collins	199	177	155
Gorbam	164	193	173	Burns	115	188	143
Pearson	153	146	149	Bullard	176	244	179
Huson	194	173	158	Louch	199	169	167
Total	884	879	779		844	916	778

The subject for discussion by the literary society for September 15 will be "The middleman."

Next Saturday night, September 16, there will be another "Open house." A musical program will be given, and refreshments will be served. On Sunday, September 17, there will be an informal "Sing" at 9 o'clock.

GORGONA.

The "smoker" and Labor Day celebration on Monday night, September 4, was well attended. Songs were sung, and toasts, in the form of tributes to labor, were heard from leading men in the various crafts employed in Gorgona. Moving pictures were also shown, and refreshments were served

In the second contest of the Isthmian bowling league rolled on the Gorgona alleys, Gatun lost two out of three games to the local team. The scores were, as follows:

	1st game.	2nd game.	3d game.
Gatun	758	768	891
Gorgona	787	797	722

The high bowling scores for the week ending September 9 are, as follows: Glow, 207; Sims, 203; Haldeman, 215.

GATUN.

A record of the games bowled on the Gatun alleys on Saturday, September 9, follows:

Gorgona.				*Total.*
Arnold	120	166	136	422
Sims	192	174	166	532
Orr	157	143	112	412
Burns	142	179	171	492
Haldeman	167	170	107	444
Total	778	832	692	2,302

Gatun.				*Total.*
Omeara	155	181	145	481
Chamberlain	157	163	170	490
Galloway	165	136	125	426
Green	157	159	165	481
Barte	167	147	186	500
Total	801	786	791	2,378

The orchestra from the *Prinz August Wilhelm* gave a concert at the clubhouse on Tuesday night. The attendance was about 300.

The gymnasium classes will be in charge of J. T. Hopkins of Gorgona on Tuesday and Friday nights of each week at 8 o'clock. The exercises will consist of marching, calisthenics, mat work, and recreative games. Miss Harris has been engaged to play the piano.

The entertainment to be given under the auspices of the Spanish War Veterans on Saturday, September 9, was postponed, and will be given on September 16. A cordial invitation is extended to all who wish to attend.

Gatun won two games from the Gorgona bowling team on Saturday night. The scores were, as follows:

				Total.
Gorgona	778	832	692	2,302
Gatun	801	786	791	2,378

CRISTOBAL.

Owing to the postponement of the debating club session on September 6, the topic for discussion which was assigned for September 13, will be debated on Wednesday, September 20—"Resolved, that the present banking laws are inimical to our republican form of government."

During the month of August, 3,122 games were bowled on the bowling alleys. The match game in the Isthmian bowling tournament, bowled on the alleys on Saturday night, between Empire and Cristobal teams, resulted in Empire taking two out of the three games rolled, the scores being as follows:

Empire.				Cristobal.			
Parkis	151	184	210	Gibson	176	178	137
Pinney	152	178	157	Blackburn	198	141	164
Anderson	198	145	166	Wallace	181	133	
Davis	235	138	134	Wheeler	147	155	138
Giavelli	146	182	137	Furlong	209	170	141
				Grover			118
Total	882	827	804		911	777	698

PORTO BELLO.

The results of the recent tournament, follow:

	Played.	Won.	Lost.	P. C.
McDevitt	5	4½	½	.900
Hanbury	8	6½	1½	.813

OFFICIAL CIRCULARS.

Record of Oil Issued.

CULEBRA, C. Z., September 5, 1911.

HEADS OF DEPARTMENTS AND DIVISIONS:

Circulars Nos. 314 and 314-A direct that a record of oil issued to various pieces of equipment shall be kept by each division, and a statement of same compiled monthly, copies of which shall be sent to those directly concerned, and to me.

On December 19, 1910, a circular letter to the Heads of Departments and Divisions was issued, calling attention to the above requirements of circulars Nos. 314 and 314-A, and stating further that "By January 1, 1911, all plant and equipment of the Isthmian Canal Commission and Panama Railroad Company, including stationary plants, etc., will have been given approved monthly allowances of oils, greases, and waste, and, subsequent to that date, it is desired that *two* copies of monthly reports of lubricants used on each item of equipment, plant, etc., be forwarded *promptly* at the close of each month to me."

Circular No. 290-C, prescribing the use of form No. C. E. 303 by engineers, or other employes in charge of the operation of any piece of equipment, in drawing all lubricants, etc., from division supply stations, stated also that "At the end of each month the requests filled shall be used in compiling report on forms C. E. 273-A and 273-B of lubricating oil, etc., consumed on each item of equipment."

These reports are exceedingly useful to the traveling engineers and the inspector attached to this office in their inspection of lubricant consumption. In some cases, however, certain of the divisions and departments have not forwarded any reports; in other cases, only one copy is received; and in practically all cases, there is considerable delay in forwarding these reports.

It is hoped that it will not be necessary to again invite attention to this matter, and that, in the future, these reports will be submitted promptly, and in the manner prescribed.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Telegraph Operators.

CULEBRA, C. Z., September 6, 1911.

CIRCULAR NO. 299-O:

The following designations and rates of pay are authorized, in addition to those published in circular No. 299:

Designation.	*Unit.*	*Rate of Pay.*
Operator (telegraph)	Month	$137.50
Operator (telegraph)	Month	150.00

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Surcharge to Marine Camp.

CULEBRA, C. Z., September 1, 1911.

CIRCULAR NO. 169-J (Corrected):

Effective this date, the same surcharge will apply on material and labor furnished the Marine Battalion at Camp Elliott as on material and labor furnished the Government of the Canal Zone.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Joachim* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct leave on Thursdays at 3 p. m.; ships for New Orleans in the coastwise service on Thursdays at 4 p.m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

The Leyland line steamer *Louisianian* sails for New Orleans direct on or about September 28.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, SEPTEMBER 20, 1911. No. 4.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

A Correction.

In the issue of THE CANAL RECORD of September 13, under "Cost of concrete," the statement is made that the Atlantic Division laid 237.05 cubic yards of material per hour, and the Pacific Division 352.67 cubic yards per hour. These figures were taken from a computation made for the Chairman's forthcoming annual report, and a revision shows them to have been incorrect. The average amount of masonry laid in the locks per service hour, during the year, was, by the Atlantic Division 260.573 cubic yards of concrete and large stone; and by the Pacific Division 281.299 cubic yards.

Chairman's Report.

The report of the Chairman of the Isthmian Canal Commission for the month of August is published in full in other columns of this issue of THE CANAL RECORD. It gives a detailed account of the progress of the Canal work in all departments and divisions.

Sale of French Scrap Material.

The sale has been authorized to the Chicago House Wrecking Company, for $215,000, of all French equipment and scrap metal in the Canal Zone that has not been taken into stock for use, or is not already in use. Bids were advertised for in the United States, and eleven tenders were received, the price offered ranging from $40,000 to that of the highest bidder, to whom the award was made. Six of the bids were for amounts less than $100,000; three for amounts between $100,000 and $200,000, and two for more than $200,000. The successful bidder agrees to pay an arbitrary rate of eight dollars a ton on the issuance of bills of lading until the total price is paid.

Included in the material sold are a number of old locomotives, dredges, excavators, dump cars, boilers, cranes, cylinders, 30 and 50-pound steel rail, scrap iron, copper, and brass. Representatives of the various bidders visited the Isthmus, and examined the material where it lay. It must be taken by the contractor from the places where it has been collected, or where it was abandoned by the French, and transported to the seaboard at his expense. A rate of $2.25 per short ton will be given by the Panama railroad for transportation to either Colon or Balboa. Most of the material that was in the Gatun Lake region has been removed, but there still remain some excavators at Tabernilla and some miscellaneous equipment at Bohio, which must be removed by the contractor before the water covers it, or be a loss. None of this material is in the Canal prism.

A statement of the net value of the French scrap sold up to July 1, 1911, is in preparation in the office of the Examiner of Accounts, and, until that is available, the exact value to the Government cannot be given. Approximately, one million dollars' worth of the material has been applied in Canal construction, however, and there have been sold in the States as scrap 17,537.23 long tons at an average gross price of $11.86 per ton.

Postal Savings System.

The President signed an Executive Order on September 8 providing for a postal savings bank in the Canal Zone. The text of the Order will be published in a future issue of THE CANAL RECORD.

Launching of the "Corozal."

The ladder dredge *Corozal* was launched at the works of the builders in Renfrew, Scotland, on September 13. After completing a working test in material similar to that which it must excavate at the Pacific entrance to the Canal, the dredge will begin its long journey under its own steam, by way of the Strait of Magellan, to Balboa. The distance is about 11,450 miles, and the voyage will take about two months.

Work in Culebra Cut.

On September 14, twenty shovels, working in the Culebra construction district of the Central Division, excavated 33,836 cubic yards of rock and earth during the working day of eight hours. The shovels were under steam 160 hours; actually at work 113 hours 20 minutes; waiting for cars 34 hours 45 minutes; other delays, aggregating 11 hours 55 minutes, resulted from mining, repairing shovel, moving shovel back, derailment, etc. The figures given above show that the average per shovel for all shovels working in the Culebra district on the day in question was 1,692 cubic yards.

Culebra Island Water Supply.

The 10,000-barrel tank now used as a water supply for the quarantine station on Culebra Island, will be replaced by one of 24,000 barrels capacity, to be built on reinforced concrete piers. A larger tank is necessary to supply the quarters on Naos Island, where the men employed on the fortification work on Flamenco Island will be housed.

COST OF EXCAVATION.

Statement of Operations for the Fiscal Year, 1910-1911.

The total amount of excavation in the Atlantic, Central, and Pacific Divisions during the fiscal year 1910-11 was 31,804,120 cubic yards. There were excavated in the Atlantic Division 6,738,513 cubic yards, of which 881,563 cubic yards consisted of material removed in the dry; 5,828,345 cubic yards were taken out by dredges working in the Atlantic entrance, and 28,605 cubic yards excavated hydraulically at Mindi. The dry excavation consisted of 475,875 cubic yards removed from the site of Gatun Locks; 125,383 cubic yards from the site of Gatun Spillway, and 280,305 cubic yards from the cut through the hills at Mindi.

The total excavation in the Central Division was 18,522,692 cubic yards, of which 16,221,672 cubic yards were removed from the Culebra section, locally known as Culebra Cut, and the remainder—2,301,020 cubic yards—from the Chagres River section.

Excavation in the Pacific Division aggregated 6,542,915 cubic yards, consisting of 462,893 cubic yards removed in the dry; 530,380 cubic yards removed hydraulically, and 5,549,642 cubic yards taken out by dredges working in the Pacific entrance. The dry excavation comprised 264,123 cubic yards removed at the Pedro Miguel and Miraflores lock sites, and 198,770 cubic yards channel excavation. The hydraulic plant removed 332,703 cubic yards from the lock site at Miraflores, and 197,677 cubic yards from the channel.

In addition to the above, there were removed in the preparation of foundations a total of 399,426 cubic yards, as follows: Gatun Locks, 152 582 cubic yards; Gatun Spillway, 32,245 cubic yards; Pedro Miguel Locks, 76,847 cubic yards; Miraflores Locks, 137,752 cubic yards.

The costs for the year, including plant charges and division expenses were, as follows:

Excavation in the dry—	*Cost per cu. yd.*
Gatun Spillway	$0.4069
Gatun Locks	0.7110
Channel, Atlantic Division	0.6010
Central Division	0.5902
Pedro Miguel Locks	0.5991
Channel, Pacific Division	0.6960
Miraflores Locks	0.7378
Hydraulic excavation—	
Mindi	0.2699
Miraflores Locks	0.5486
Channel, Pacific Division	0.6106
Dredging excavation—	
Atlantic Division	0.2215
Pacific Division	0.2519
Preparation for foundations—	
Gatun Spillway	1.5048
Gatun Locks	1.5540
Pedro Miguel Locks	2.3746
Miraflores Locks	1.6085

Repairs to the "Allianca."

It is expected that repairs to the *Allianca* will not be completed until October 1, and its sailing of September 23 from New York is, therefore, cancelled. If the repairs are com-

NOTES OF PROGRESS.

(Continued.)

pleted the *Allianca* will leave New York on October 5, taking the place of the *Advance*, which will sail on October 18. If the repairs are not completed in time for this arrangement, the *Advance* will continue on its schedule, and the *Allianca* will sail from New York on October 18.

Pacific Division Sand Service.

A report of sand cars loaded and shipped from Balboa during the month of August, 1911, follows:

DESTINATION.	Number Cars.	Cubic Yards.
Pacific Division	2,669	40,035
Central Division	32	5 8
Atlantic Division	15	361
Quartermaster's Department	3	70
Panama railroad	7	175
Miscellaneous	25	405
Total	2,751	41,574

Hydraulic Excavation Increasing.

Nearly 150,000 cubic yards of material were removed from the lower lock at Miraflores, and from the Canal prism south of it, by the Pacific Division hydraulic equipment during the month of August, the exact amount being 149,926 cubic yards. This is by far the largest month's output since the installation of the plant, and represents over one-fifth of the hydraulic excavation so far accomplished in this section up to September 1, viz., 750,078 cubic yards. The bulk of the material was taken from the Canal prism, south of the locks, and was comparatively free of the gravel which was so prevalent at the lower lock site.

Three dredge pumps were kept in commission, two in continuous operation, during the month, lifting the disintegrated material from sumps, after it had been washed loose and broken up by streams from the monitors. One pump forced material into the core fill of the west dam, and 25,000 cubic yards were handled in this way. This pump operated at one side of the lower lock, and its sump was diked in, so as not to interfere with the steam shovel operations in progress directly opposite. The balance of the material was forced upon the flats near the Rio Grande diversion, east of the Canal. The land there has been raised to elevation +15, and, to prevent the mud from flowing into and blocking the Rio Grande, wooden barriers have been constructed. A pipe line is being laid to extend operations to the low ground further south, where there is a greater area to be filled.

The main sump in connection with hydraulic operations in the prism, south of the locks, will be situated a little north of the pumping plant, close to the west bank. This sump was excavated, 18 by 22 feet, to elevation —50. Here, the relay pump, originally designed to work in connection with the west dam fill, has been set up, thereby relieving one of the dredge pumps, which will be sent to shop for a general overhauling. Upon being excavated, the sump was partly filled with selected material—rock screenings and sand, as a protection against boulders in the surrounding material. The relay pump will operate from a series of benches on the side of the sump, so that as the excavation increases in depth, the location of the pump can be correspondingly changed to suit the different levels. The soil in this part of the prism is mixed with a large amount of buried tree débris. This is collected into piles, and, although sodden, is forced to burn by running a compressed air pipe underneath the pile, and turning on a jet, which operates as a forced draft.

In the open water channel, which begins a short distance south of the site of present operations, nothing can be done hydraulically until a coffer dam is thrown across it. The material for this dam is mostly on the ground, and the work of constructing it will be started in the next two weeks. The water in the lake thus formed will be lowered to the point where the monitors and pumps can work advantageously.

CONCRETE WORK IN THE LOCKS.

Over 65 per cent of the concrete for all the locks is in place, the amount at the close of the work on September 16, being 2,732,195 cubic yards, out of a total of approximately 4,199,400. A total of 31,046½ cubic yards of concrete was laid in the locks during the week ending September 16.

GATUN LOCKS.

About 80 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on September 16, being 1,596,370 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending September 16, and of the total, follows; and a similar statement for the work in the Spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers			Large stone.	Total.

*The 417½ yards shown for the portable mixers are reinforced concrete, and were placed on the following days: September 11th, 55; September 12th, 76½; September 13th, 78½; September 14th, 78; September 15th, 69; September 16th, 60½.

PEDRO MIGUEL LOCKS.

Concrete work in the locks at Pedro Miguel is over 86 per cent completed, 722,989 cubic yards, out of a total of 837,400, bucket measurement, having been placed at the close of work on September 16. The record for each of the six 8-hour working days of last week, follows:

DATE.	AUXILIARY PLANT.						Large stone.	Total.
	2-cubic yard mixers.			⅓-cubic yard mixer.				
	Concrete placed.	Hours worked.	No. of mixers	Concrete placed.	Hours worked.	No. of mixers

MIRAFLORES LOCKS.

Over 30 per cent of the concrete for the system of two twin locks at Miraflores was in place on September 16, the total amount on that date being 412,836 cubic yards, bucket measurement, out of a total of approximately 1,362,000. The record for each of the six 8-hour working days of last week, follows:

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT.							Total.
				2-cubic yard mixers.			⅓-cubic yard mixer.

RECRUITING LABORERS.

Upward of 1,300 Brought to Isthmus Within Past Three Months.

Nearly 1,000 contract laborers have been recruited in the Antilles during the past three months for work on the Canal. Most of these came from the islands in the neighborhood of Barbados, but only a few of them were Barbadians, because the island government has prohibited further recruiting there. The headquarters of the Commission's recruiting agent, however, has been maintained at Bridgetown, the capital of Barbados, and most of the laborers took ship from that port. It was intended to recruit a full 1,000 men, but the contingent that arrived on the Isthmus on September 3 will probably be the last, as the total is but a few short of the desired number, and the labor supply is no longer short. During the month of July, 195 men were brought to the Isthmus in two lots, consisting of 49 and 146 men, respectively; in August, 507 in two lots of 271 and 236, respectively, and, on September 3, there arrived another lot of 239 men, making a grand total of 941.

In addition to the above, 249 laborers have recently been recruited from Fortune, Turk's, and other islands in the Bahama group for work on the Panama railroad relocation, and at other points. The Panama railroad steamship *Advance* brought 43 at one time, and 56 at another; the *Prinz Sigismund* of the Hamburg-American line, had 70 on board on its last trip, and the *Cristobal* landed 80 on September 6. These men were recruited under an arrangement with a man named Mora, who is known throughout the Bahamas as the "King of Fortune Island." He furnishes the men at a stated price per head, and sends his sloops among the neighboring islands to pick them up. The recruits are unusually robust, make excellent workmen, and those selected for the Canal work are nearly all young men, or men in their prime. The majority are direct descendants from their African forebears, and, therefore, differ from a great many of the inhabitants of the West Indies, inasmuch as they are more than usually free from mixed blood.

A few Peruvians, numbering 27 in all to date, have been added to the Canal force. They come under no contract with the Commission, and pay their own way, but are given work as soon as they report.

Civil Service Examinations.

Examinations will be held, probably on October 22, for the following positions. Agricultural inspector, Philippine service; assistant observer, Weather Bureau service; civil engineer, Departmental and Philippine services; civil engineer and draftsman, departmental service; cadet engineer and cadet officer, Lighthouse service; electrotyper-finisher, electrotyper-molder, and stereotyper, Government Printing Office; mechanical draftsman and topographic draftsman, Isthmian Canal service; engineer, Indian service; pharmacist, Public Health and Marine Hospital service; printer, Government Printing Office; surveyor, Philippine service; trained nurse, Isthmian Canal, Indian, and Philippine services; wireman, departmental service.

Women will be admitted only to examination for the position of trained nurse.

Applications will not be received after September 29 for the above examinations. The kind of examination desired should be stated in requesting information in regard to any of the above.

In answer to the question in application forms as to *bona fide* residence, applicants are required to show residence *up to the date of application.* It is to be noted that *bona fide* residence does not require continuous bodily presence, but refers to the place at which an applicant, if a voter, is legally entitled to vote.

JOHN K. BAXTER, *Secretary,*
Isthmian Civil Service Board.

CULEBRA, C. Z., September 14, 1911.

Boy Scouts.

Seventy-five boy scouts, accompanied by four leaders and five scout masters, made an excursion to Old Panama on Labor Day. Two special cars attached to the southbound morning train brought the boys from Colon and the intermediate stations. The "hike" out, about eight miles, was made in two hours and a half and the day was spent on the beach in scout games and practice. Dinner was cooked by the boys. The boy scouts have been organized on the Isthmus one year. They are divided into patrols of eight, and two or more patrols form a troop. Each patrol has a scout leader elected from its number, and each troop has a scout master, who is elected by the managing council, called the Isthmian Scout Council. The organization is affiliated with the National Boy Scouts of America.

Up to the present time, the local troops have made their "hikes" into the nearby country, accompanied by their leaders and masters, but, at a recent meeting of the council, it was decided to hold one general outing a month, when all the troops would meet at some central place, proceeding thence to the point decided upon.

The majority of the Zone scouts have passed through the "tenderfoot" class, and are second-class scouts. Any boy scout leaving the Isthmus will be passed into any troop in the States in the class in which he stands on leaving.

Hebrew Benevolent Society—New Year 5672.

Services will be conducted at the Sojourners' lodge room, Colon, on Friday evening, September 22, at 6.30 o'clock, and on Saturday morning, September 23, beginning at 8.30 o'clock. All Jewish residents of the Canal Zone are cordially invited.

Death of James J. Riley.

James J. Riley, aged 29 years, a sailor on the *Newport News,* born in Boston, Mass., was struck by a switch engine in the railroad yard at Colon on the morning of August 31, and killed. Information is desired with regard to his home or relatives, in order that they may be informed of his death.

Ancon Rifle Club.

As a result of a meeting held on September 17, the organization of the Ancon Rifle Club was completed, and it was decided to make application for a charter, and to affiliate with the National Rifle Association of America. Further information may be obtained by addressing the secretary, Wm. J. Ergenzinger, Ancon.

August Weather.

The general deficiency in rainfall in the Canal Zone continued during the month of August. The average temperatures for the month, at all stations, were the highest of record, while the mean atmospheric pressure at each of the stations was the lowest of record.

PERSONAL.

Lieutenant-Colonel C. A. Devol, accompanied by his wife and daughter, sailed on the *Panama* on September 17, on his annual leave of absence.

Mr. S. B. Williamson, accompanied by his daughter, sailed on the *Panama* for New York on September 17, on annual leave.

Mr. Edward J. Williams left the Isthmus on his annual vacation leave on September 16.

Mr. J. A. Smith will arrive on the *Colon* on September 24 from his annual vacation in the States.

Mr. C. M. Saville, accompanied by his wife and son, left on the *Cristobal* on September 17, for his annual leave in the States.

Among the passengers on the *Advance,* which arrived at Cristobal on September 17, were Mr. T. C. Clear and wife; Major John C. Oakes, Corps of Engineers; and Captain L. D. Cabell of the Quartermaster's Department, U. S. A.

Pilots, Mates, Masters, Chauffeurs.

Examinations for pilots, mates, and masters; and for chauffeurs, will be held by the Board of Local Inspectors at Ancon, C. Z., on September 27. All applicants for examination should be present at 8 a. m.

Gorgona Catholic Club.

The Gorgona Catholic Club held a banquet at the I. C. C. hotel on Saturday evening, September 16, in honor of the Rev. Father Rojas, pastor of the Gorgona Catholic Church. The club was organized in May, 1911, and now has 60 members.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 69 per cent completed, 155,522 cubic yards, out of a total of 225,000, having been placed at the close of work on September 16. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
September 11..........	152	7.00	1
September 12..........	140	7.00	1
September 13..........	160	10.30	2
September 14..........	156	10.30	2
September 15..........	168	8.00	1
September 16..........	176	8.00	2
Total..............	952	51.00	1.50
Previously reported...	154,570		
Grand total..........	155,522		

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending September 16, follows:

DATE.	Hours worked.	Cubic Yards.
September 11....................	4.24	1,618
September 12....................	3.08	1,121
September 13....................	4.25	1,887
September 14....................	3.43	1,486
September 15....................	4.22	1,758
September 16....................	3.59	1,603
Total	24.01	9,473

Sailing of the "Ancon."

The steamship *Ancon* will sail from dock No. 11, Cristobal, for New York on Thursday, September 28, at 3 p. m.

CANAL WORK IN AUGUST.

Monthly Report of the Chairman and Chief Engineer to the Secretary of War.

CULEBRA, C. Z., September 15, 1911.

The Honorable the Secretary of War,
Washington, D. C.

SIR: I have the honor to submit the following report of operations on the Isthmus for the month of August, 1911.

Department of Construction and Engineering.

The following table summarizes the principal items of construction work accomplished by the Atlantic, Central, and Pacific Divisions during the month:

ITEM.	Unit.	Atlantic.	Central.	Pacific.	Total.
Work excavation, dry	Cubic yards	87 599	1,454,322	156,633	1,698 554
Work excavation, wet	Cubic yards	367,456	9,972	630,241	1,007,669

First Division, Office of the Chief Engineer.

MASONRY AND LOCK STRUCTURES.

As stated in the report for the month of July, the material under contract for work designed in this subdivision is being inspected by the force of the General Purchasing Officer in the United States, and the erection work is being done by the division engineers. The field work consisted of valve tests at Gatun, experiments of flow of water through different sized orifices, and the inspection of buffer castings under fabrication at the Gorgona shops.

Lock Gates and Protective Devices—Up to August 20, a total of 31,738 tons of material had been accepted at the mills, 2,482 tons having been fabricated in the shops during the month. Up to August 20, a total of 12,759 tons of this material had been shipped to the Isthmus.

The first eight leaves for Gatun and Pedro Miguel upper guard gates, 54 feet 8 inches high, have been completed in the shop and shipped. Eight of the 77-foot leaves for the upper and middle gates of upper Gatun Lock are within three per cent of completion, and over fifty per cent of this material has been shipped to the Isthmus. Of the upper and middle gates at Pedro Miguel, 79 feet high, 45 per cent of the shop work has been completed, although but 40 per cent has so far been accepted, and a very small percentage shipped to the Isthmus.

At Gatun, one leaf of the upper guard gate of the upper lock has been erected to its full height, and about 90 per cent of the sheathing plates have been fitted in place, and 20 per cent of the riveting done. The other leaf in the same lock has been erected to its full height, with the exception of the top girder. All interior framing, with the exception of the top panel, has been riveted in place. On these two leaves, about 75 per cent of the sheathing plates have been fitted and erected, and 16 per cent of the riveting done. The corresponding leaves in the twin lock have been erected to the height of seven panels, and sheathed up to the sixth panel. Riveting has just commenced on these leaves.

Erection work has been started at Pedro Miguel on the four 54-foot 8-inch leaves of the upper guard gates, the bottom girders for three leaves having been placed in the lock chambers. The fourth leaf of this size gate has been erected seven panels high, with the interior framing fitted in place, but not riveted.

Satisfactory progress has been made in the erection and adjustment, as well as in the babbitting, of the nickel steel bearing plates in the hollow quoins at both Gatun and Pedro Miguel.

Inspection of Operating Machinery and Electrical Equipment—The inspection force under this subdivision reporting directly to this office has cared for the technical matters relating to inspection, as follows:

(1) For the Stoney gate and cylindrical valve machines to be tested at the works of the manufacturer, purchased under Circular 614—Less rapid progress was made than during the preceding month, the delay having been occasioned by tardy delivery of material on suborders. The last of the motors, which are to be subjected to competitive test under this circular, were shipped from the factory during the month. Foundation bolts and washers for the above have arrived on the Isthmus, and have been inspected, and it is anticipated that installation will begin during the month of September.

(2) For the rack railway and other material purchased under Circular 619—The manufacture of this material has progressed satisfactorily, with the exception of the rack section, trouble being experienced by the manufacturer in casting the same. To date, no award has been made on classes 4, 5, and 6 of this circular.

(3) For the gate operating machines, class 1, and miter forcing machines, class 2, purchased under Circular 627—Inspection of the sample machines of the first class is just commencing; progress on the sample machines of the second class is making rapid advancement, and will likely be completed during the month of September.

(4) For the gate and girder hoisting machinery for the emergency dams—The organization is being planned to include this inspection as the need shall arise. The drawings required to be submitted by the contractor are nearing completion, and will be submitted for approval in the near future.

Emergency Dams—The work under this subdivision in the United States has consisted principally in the checking of shop drawings made by the contractor, a total of 137 drawings having been approved up to August 23. Of the construction work in connection with the emergency dams, 43 patterns of the various castings were completed, and patterns for 27 additional castings were in course of preparation.

AIDS TO NAVIGATION.

During the month, 133 acres of land were cleared in the vicinity of Frijoles and Mamei for sights for beacons and reference buoys; 40,050 linear feet of trochas were cut, and the necessary land for making surveys cleared and profile taken. Twelve gas buoys were located and referenced between Bohio and Caimito; three beacons were located and referenced between San Pablo and Caimito; and two lights were located at Balboa.

Atlantic Division.

GATUN LOCKS.

Excavation—Crane excavation in the lower lock, and shovel excavation for obtaining clay for back fill, were continued. A total of 594 cubic yards of material was removed by crane and hand, and 20,100 cubic yards by shovel. On August 31, the total excavation amounted to 5,909,939 cubic yards, of which 5,036,519 cubic yards were removed from the prism. The excavation in the locks was 99.78 per cent completed.

Back fill—Back filling behind the side walls of the upper, middle, and lower locks, and in the center wall of the upper lock, was continued. The quantity placed during August aggregated 78,850 cubic yards, increasing the total to 685,467 cubic yards. On August 31, the back filling was 42.25 per cent completed

Receiving and Issuing Material—The consumption of rock, sand, and cement during the month exceeded the receipts by the following respective amounts: 18,392 cubic yards, 3,110 cubic yards, and 19,888 barrels.

Mixing and Placing Plants—Both plants, and all portable mixers, were kept in satisfactory operation during the month.

Power Plant and Pumps—The operation of the power plant and pumps was satisfactory.

Iron and Steel Work—During the month, 343.3 tons of fixed steel, 82 tons of reinforcing rails, and 35,462 feet of reinforcing rods were placed, and 300 linear feet of electrical track were laid.

Concrete Work—There was a decrease of 4,117½ cubic yards in the amount of concrete laid, as compared with the figures for the preceding month. The daily average for the 27 working days was 2,478 cubic yards, as compared with a daily average during July of 2,842 cubic yards. The total amount of concrete placed during the month was 66,928 cubic yards, including 4,416 cubic yards of large stone. The bucket measurement exceeded the place measurement by 374 cubic yards. Of the total concrete, 4,562 cubic yards were placed in the upper lock, 17,608 cubic yards in the middle lock, and 44,758 cubic yards in the lower lock. The concrete work for the entire lock system was 78.13 per cent completed at the end of August.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)..	11.29	8.50
Average number of hours per day worked, per strand of cableway laying concrete and large stone (actual working time)........................	6.06	....
Average number of mixers per day..........................	7.00	2.00
Average hourly output per mixer (actual working time) cu. yds.	59.47	61.81

Concrete laid, dump cars, cu yds	....	9,088
Concrete laid, portable mixers..	....	2,090
Total amount of concrete and large stone laid, cu. yds..	50,788	16,514

GATUN DAM.

Construction during the month increased the total fill, as determined by cross sections of the material in place, by 491,815 cubic yards, making the total amount in place 15,311 792 cubic yards.

Hydraulic Fill—The dredges increased the hydraulic fill by 259,389 cubic yards. The total hydraulic fill in place August 31 was 7,996,328 cubic yards.

Dry Fill—Material received from the Central Division and steam shovel No. 134, amounting to 232,426 cubic yards, was placed on the north and south toes of the Dam, east and west of the Spillway, making the total dry fill in place 7,315,464 cubic yards.

GATUN SPILLWAY.

Excavation—In preparing foundations of the Spillway dam, 742 cubic yards of rock were removed by hand. On August 31, the total Spillway excavation amounted to 1,585,608 cubic yards.

Concrete—The work of placing concrete was continued, the amount placed during the month aggregating 5,050 cubic yards, which increased the total to 155,731 cubic yards. The concrete work for the Spillway was 68.8 per cent completed.

Hydroelectric Plant—On August 15, excavation was commenced on the site of the power house, and continued to the close of the month, 20,625 cubic yards of earth being removed.

HARBOR AND CHANNEL SECTION.

Excavation Below Sea Level at Mindi—During the month, two steam shovels removed 20,728 cubic yards of earth and 44,313 cubic yards of rock from the Canal prism.

Dredging from the Ocean to Mindi—Five dredges removed 324,156 cubic yards of earth and 43,300 cubic yards of rock from the Canal prism. In addition, dredge *No. 86* placed 4,989 cubic yards of material in the Colon fill, which was completed on August 4. On August 31, forty feet of water could be carried from zero to zero plus 2,000 feet; 35 feet to mile 3 plus 3,600 feet; 30 feet to mile 4 plus 650 feet; 20 feet to mile 5 plus 2,438.9 feet, at the junction with the French canal.

WEST BREAKWATER, COLON.

Forty-eight thousand four hundred and twenty-one cubic yards of rock were excavated, of which amount 44,958 cubic yards were placed in the breakwater, and 3,463 cubic yards in track fill. The double track trestle was extended 647 linear feet. On August 31, the trestle extended 6,619 feet from shore. The total amount of rock dredged and dumped on the west breakwater to August 1, 1911, was 643,877 cubic yards. During the month, 43,300 cubic yards were dredged and dumped, increasing the total to 687,177 cubic yards. The amount of dry fill placed to September 1 was 454,490 cubic yards.

PORTO BELLO.

PERFORMANCE OF ROCK CRUSHER PLANT.

Length of working days—hours...........	8.00
Average number of hours worked per day..	3.98
Average number of cubic yards per hour of working day...........................	193.60
Average number of cubic yards per working hour................................	389.30
Maximum day's output, (5 hours 23 minutes) cu. yds.............................	2,176.00
Average day's output (27 days) cu. yds.....	1,549.00
Average hourly output, (209 hours 10 minutes) cu. yds..........................	200.00
Total output for the month, cu. yds........	41,826.00

SAND, STONE, AND CEMENT SERVICE.

In connection with this service, plant steamed 6,250 miles, handled 625 barges, and carried 2,240 passengers.

NOMBRE DE DIOS.

During the month, 55 barges, containing 27,788 cubic yards of sand, were shipped to Gatun.

MUNICIPAL ENGINEERING.

The reservoirs, water mains, sewers, roads, and oil pipe lines were maintained and extended, as required to facilitate construction work.

Central Division.

During the month of August, the total amount of material excavated in the Central Division was 1,464,294 cubic yards, of which 191,485 cubic yards were classified as earth and 1,272,809 cubic yards as rock. Of this quantity, 1,442,402 cubic yards were removed by steam shovels, and contractors removed 9,972 cubic yards by sluicing; and 11,920 cubic yards by hand. The total—1,464,294 cubic yards—consisted of primary excavation for the Canal prism.

The daily average number of steam shovels at work during the month was 40.66, and the total number of shovel days was 1,098, as compared with 40.70 shovels at work during the month of July, with 1,017½ shovel days.

For comparison with the work done by steam shovels during the corresponding month of the previous year, the following table has been prepared:

Period.	Excavated by shovels.	Classification of material.		Av. No. of shovels at work	Working days.	Av. yards per shovel day.
		Rock.	Earth			
1910:	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*			*C. Y.*
Aug....	1 602 738	1,174,446	428,292	44 63	27	1,330.10
1911:						
Aug ...	1,442,402	1,269,309	173,093	40 66	27	1,313.66

Rainfall at Empire: 1910, 10 08 ins.; 1911 5.98 ins.

The above table shows the average output per shovel to have been 0.12 per cent greater in August, 1910, than in the corresponding month of the present year.

The total amount of material excavated from the prism in the Culebra section of the Central Division in August, 1911—1,442,402 cubic yards—was the highest record in that section for the month of August, the previous high record for the month having been in August, 1910, when 1,377,714 cubic yards were removed.

The total estimated amount of material to be removed in the Central Division, according to the revised estimate of July 1, 1911, was 101,801,296 cubic yards, and up to September 1, 1911, 80,162,646 cubic yards had been removed, leaving 21,638,650 cubic yards to be removed in order to complete all excavation in the Central Division. From these figures, it will be seen that 78.74 per cent of all excavation in the Central Division had been completed up to the close of the month of August, and 21.26 per cent remained uncompleted.

Considering the two sections which compose the Central Division, the excavation completed, and that to be completed, at the close of August operations was, as follows:

CULEBRA SECTION.	*Cu. Yds.*
Completed...........................	68,295,100
To be completed.....................	21,148,905
CHAGRES SECTION.	*Cu. Yds.*
Completed...........................	11,867,546
To be completed.....................	489,745

From the above figures, it will be seen that the Culebra section, locally known as the "Culebra Cut," was 76.35 per cent completed, with 23.65 per cent to be completed; the Chagres section was 96.04 per cent completed, with 3.96 per cent to be completed.

During the month, 37,708 cubic yards of material were hauled from the Canal prism and dumped in the embankment for the roadbed of the relocated Panama railroad. The total amount of spoil from the Central Division used for this purpose at the close of the month, was 3,921,311 cubic yards. The Central Division also delivered at Gatun 235,231 cubic yards of rock and earth for use in the construction of the Dam, making the total for this purpose at the end of August, 4,228,067 cubic yards.

The daily average number of laborers at work on the whole division during the month was 7,366, and the daily average number of gold employes was 797.

Pacific Division.

DISTRICT NO. 1—LOCKS AND DAMS.

Excavation—The total excavation during the month amounted to 156,633 cubic yards.

Filling and Embankment—During August, 24,812 cubic yards of dry filling were added to the prism of the west dam at Pedro Miguel, increasing the total amount of material in place at the close of the month to 300,529 cubic yards. The back fill at Pedro Miguel was increased by 22,088 cubic yards, the total in place at the end of the month amounting to 320,118 cubic yards.

At Miraflores, 72,203 cubic yards were added to the dry fill in the toes, and 25,000 cubic yards to the hydraulic fill in the core of the west dam, making the totals at the end of the month 943,117 cubic yards, and 632,689 cubic yards, respectively. The back fill was increased by 6,117 cubic yards, the total aggregating 181,058 cubic yards at the end of the month.

Pedro Miguel Locks—The general back filling behind the west wall was continued, as was also the filling in of the middle wall. The McClintic-Marshall Construction Company commenced erection of the upper lock gates on August 7.

Concrete Work—The total amount of concrete and large stone laid at Pedro Miguel was 20,736 cubic yards, as compared with 19,906 cubic yards during July. The concrete was placed, as follows: Six thousand five hundred and seven cubic yards in the east wall; 6,593 cubic yards in the west wall; 6,484 cubic yards in the center wall; 202 cubic yards in the floors; and 950 cubic yards in the southwest wing wall.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT PEDRO MIGUEL.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)..	8.00	8.00
Average number of hours per day, worked laying concrete and large stone (actual working time)	4.11	5.17
Average number of mixers per day	....	5.15
	Cu. Yds.	*Cu. Yds.*
Average hourly output per mixer (actual working time)...	....	28.13
Average amount of concrete and large stone laid per hour, per chamber crane (actual working time)	41.92	....
Large stone laid	....	....
Concrete laid	4,650.00	16,086.00
Total concrete laid	4,650.00	16,086.00

Permanent plant consisted of two chamber cranes, placing. No mixers.

Auxiliary plant consisted of three 2-cubic yard mixers, and a daily average of 2.19 ½-cubic yard mixers, A daily average of 2.07 ½-cubic yard mixers discharged directly into forms, balance of concrete placed by chamber cranes, and with locomotive cranes and derricks, averaging 3.07 units daily.

Miraflores Locks—The McClintic-Marshall Construction Company commenced the erection of berm crane "E" on the east berm of the locks. Chamber crane No. 4 was placed in operation August 2 laying concrete in the middle wall. Dry excavation in the lower lock was continued, and steam shovel excavation for the solid portion of the upper guide wall was completed. Filling was continued in the east and west toes of the west dam. During the month, the amount of iron placed aggregated 306,073 pounds.

Concrete Work—The total amount of concrete and large stone laid was 57,003 cubic yards, as compared with 32,840 cubic yards during July. The concrete was placed, as follows: Five thousand two hundred and thirty-nine cubic yards in the east wall; 25,498 cubic yards in the west wall; 23,730 cubic yards in the center wall; and 2,536 cubic yards in the floors.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT MIRAFLORES.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)..	8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	6.55	6.30
Average number of mixers per day	5.22	3.74
	Cu. Yds.	*Cu. Yds.*
Average hourly output per mixer (actual working time)	42.19	38.06
Average amount of concrete and large stone laid per hour, per berm, or chamber crane (actual working time)	60.28	....
Large stone laid	....	....
Concrete laid	53,285.00	3,718.00
Total concrete laid	53,285.00	3,718.00

Auxiliary plant consisted of a daily average of 1.81 ½-cubic yard mixers, discharging directly into forms, and a daily average of 1.93 2-cubic yard mixers, the output of which was placed by chamber cranes.

DISTRICT NO. 3—MUNICIPAL AND SANITARY ENGINEERING.

The reservoirs, water mains, sewers, roads, and oil pipe lines were maintained and extended, as required to facilitate construction work.

DISTRICT NO. 4—ANCON QUARRY.

PERFORMANCE OF ROCK CRUSHER PLANT.

	Hours.
Length of working day (hours)	8.00
Average number of hours per day (actual working time)	6.26
Average number of cubic yards crushed per hour of working day	272.97
Average number of cubic yards crushed per working hour	348.84
Total output for the month, cubic yards	58,962.00

DISTRICT NO. 2—DREDGING.

The following is a statement of the five dredges which were in operation during the month, and of the amount of material excavated hydraulically.

Dredge.	Type.	Work.		Plant.		Total.	Remarks.
		Earth.	Rock.	Earth.	Rock.		
		Cu. Yds.	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds,*	*Cu. Yds.*

Grand Total	....	616,816	13,425	8 284	....	638 525	

*Excavated from Canal prism, south of Miraflores lock site.

CHAMÉ SAND EXCAVATION.

Approximately 41,700 cubic yards of sand were excavated at Punta Chamé, and delivered at Balboa.

Relocation of Panama Railroad.

During the month, 371,076 cubic yards of material were excavated, increasing the total excavation at the close of the month to 8,225,018 cubic yards; and 396,766 cubic yards of material were placed in embankment, increasing the total for this purpose to 13,972,202 cubic yards.

The average daily number of steam shovels at work was 9.41, and the total number of working days was 27.

For comparison with the work done by steam shovels during the preceding month, and during the corresponding month of the previous year, the following table has been prepared:

Period	Excavated by shovels.	Classification of material.		Av. No. of shovels at work.	W'kg days.	Av. yards per shovel day.
		Rock.	Earth.			
1910:	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*			*C. Y.*
Aug....	250,341	86,310	164,031	7.04	27	1,318
1911:						
July....	338,760	251,930	86,830	8.72	25	1,554
Aug....	359,363	242,331	117,032	9.41	27	1,415

During the month, 954 feet of temporary trestle were driven, and work on bridges and culverts was continued. No permanent track was laid during the month, the amount of 70-pound and 90-pound track remaining at 134,698 linear feet, and 42,043 linear feet, respectively, as previously reported. The force averaged 2,285 men, in addition to those employed by contractors.

Quartermaster's Department.

LABOR.

Five hundred and seven laborers were received from Barbados during the month.

QUARTERS.

There was an increase of 700 West Indians occupying Commission quarters during the month. On account of the approaching abandonment of the Tabernilla–San Pablo district, no more assignments of married quarters will be made in that district.

BUILDINGS.

Three gangs of carpenters, and one gang of painters, were employed at Las Cascadas making the necessary repairs, alterations, and moving buildings for the accommodation of the regiment of infantry, which is expected during the latter part of September.

MATERIAL AND SUPPLIES

The value of material received from the United States during the month was $539,840.08, as compared with $909,323.75 during August, 1910. Supplies during the month were delivered by 34 steamers, the total weight of cargo aggregating 32,151 tons, exclusive of 859,744 feet, board measure, Douglas fir lumber; 680,007 feet, board measure, yellow pine lumber; 253,457 feet, board measure, white oak lumber, 663 pieces of piling, and 230 cross-ties.

Subsistence Department.

The operation of the European laborers' messes, the colored laborers' kitchens, and the line hotels showed a net profit of $4,277,89. The operation of the Hotel Tivoli showed a net profit of $1,433.34, and there was a net loss on restaurants, penitentiary, tugs, and dredges of $24.01. The net profit on subsistence operations was $5 687.22.

Department of Civil Administration.

COURTS.

During the month, 37 civil and 50 criminal cases were disposed of in the Supreme and Circuit Courts, and 60 civil and 559 criminal cases in the District Courts.

DIVISION OF POSTS, CUSTOMS, AND REVENUES

Money order sales for August amounted to $420,123.54, and the fees to $1,859.02. Receipts from stamp and card sales, and newspaper postage aggregated $5,978.60. The total collection of revenues made by the division was $7,617.30, and the collection on account of court fines, costs and fees, $3,135.60.

Twenty-eight vessels entered at, and 27 vessels cleared from, the port of Ancon; and 26 vessels entered at, and 24 vessels cleared from, the port of Cristobal.

DIVISION OF POLICE AND PRISONS.

The total number of persons arrested was 548, of whom 498 were men and 50 women. Twenty-five nations, or 49 separate states and dependencies were represented. The total number of arrests for the month was a decrease of 13, as compared with July. Thirteen convicts were committed to the penitentiary, and 15 were discharged, leaving 142 in confinement at the close of the month. The cost of guarding and subsisting the convicts was $2,978.50, and the value of their work on Canal Zone roads $2,212.05.

DIVISION OF FIRE PROTECTION.

Eight fires were reported in the Canal Zone during the month, as compared with 13 in July. The damage to Commission property was $133, and to private property $5,000.

DIVISION OF PUBLIC WORKS.

In the city of Panama the average daily consumption of water was 1,383,288 gallons and in Colon 904,907 gallons.

The usual inspection and maintenance

work of this division was performed during the month.

Department of Sanitation.

The total number of deaths from all causes among employes was 38, These were divided, as follows: From disease, 26, and from violence, 12, giving the annual average per thousand of 6.27 and 2.90, respectively.

The annual average death rate per thousand among employes for the month of August in previous years since American occupation was, as follows:

1904	13.93
1905	19.97
1906	62.12
1907	27.59
1908	11.39
1909	10.28
1910	13.04

The annual average death rate per thousand in the cities of Panama, Colon, and the Canal Zone, including both employes and nonemployes, was 20.31.

The annual average death rate per thousand for the month of August among the same class of population for previous years was, as follows:

1905	51.05
1906	64.12
1907	33.75
1908	26.65
1909	16.20
1910	19.85

Segregating the whites from the blacks, the annual average death rate per thousand from disease among employes was: For whites, 6.45; blacks, 6.23, giving a general average of 6.27. For the same month during 1909, the annual average death rate per thousand from disease was: Whites, 6.19; blacks, 6.10, giving a general average of 6.12, and for the same month during 1910: Whites, 5.28; blacks, 8.11, giving a general average of 7.35.

Among employes during the month, deaths from the principal diseases were, as follows: Chronic nephritis, 3; hæmoglobinuric fever, 4; lobar pneumonia, 4; malaria fever, E. A., 1; tuberculosis, 4; typhoid fever, 1, leaving a balance of 9 deaths from all other diseases, and 12 deaths from external violence.

Nineteen cases of diptheria were reported during the month, 14 from the Canal Zone, 3 from Panama, and 2 from Colon, with one death. The type of the disease continued mild, and there was a marked decrease in the number of cases treated.

No cases of yellow fever, smallpox, or plague were brought to, or originated on the Isthmus during the month.

Respectfully,

GEO. W. GOETHALS, *Chairman.*

Society of the Chagres.

The recently organized association of employes who have completed six years' service on the Isthmus will be known as "The Society of the Chagres." The emblem of the society will be a circular pin, nine-sixteenths of an inch in diameter, showing on a black background, surrounded by a narrow gold border, six horizontal bars in gold. On the back of the pin will be engraved the name of the society, the name of the member owning the pin, and the date on which the latter entered the service. On the 16th instant, seventy-five charter members had been enrolled.

Obituary.

Stephen H. Alton, employed at Porto Bello, died at Colon Hospital on September 9. He was 41 years of age, single, and had been on the Isthmus fourteen months, having come from California.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

GENERAL.

A banquet in honor of Mr. A. B. Dickson will be held at the Empire hotel on Friday night, September 22, at 8.30 o'clock. Mr. Dickson has been promoted from secretary of the Empire clubhouse to superintendent of all the clubhouses under the Commission.

The official score for the Isthmian tenpin league up to Saturday, September 16, follows:

	Won.	Lost.	P. C.
Cristobal	12	6	.667
Empire	12	6	.667
Gorgona	12	6	667
Marines	9	9	.500
Gatun	7	11	.388
Culebra	3	15	.200

The moving picture schedule for the week of September 25 to 30 is, as follows: Monday, Corozal; Tuesday, Empire; Wednesday, Culebra; Thursday, Gatun; Friday, Cristobal; Saturday, Gorgona.

COROZAL.

A "smoker" was held in the gymnasium of the Corozal clubhouse on Tuesday evening, September 12. The program consisted of an act on the parallel bars by Bath and Kramer; a vocal solo by Mrs. Kramer; an acrobatic act by Stapleton, and Indian club swinging by Mr. Kramer. This was followed by a handcuff escape act by Messrs. Bath and Playford, and Mr. Holmes concluded the program with a fancy dancing act. Refreshments and singing ended the evening's entertainment. One hundred and fifty men were present.

CULEBRA.

A second game of chess by wireless was begun with the Porto Bello association two weeks ago. Culebra won the first game.

The volleyball game between the assistant engineers and the married men on Tuesday evening, September 12, resulted in favor of the former by the score of 3 to 2. The game on Thursday evening, between the independents and assistant engineers was won by the latter. Score, 3 to 0.

The motion picture entertainment will be given on Friday night, September 22, instead of Saturday night, as previously published.

The Gorgona bowling team took three games at bowling from Culebra on Saturday evening, as follows:

Gorgona.				Culebra.			
Otis	164	163	174	Mengel	142	135	152
Arnold	151	147	159	Driscoll	166	126	153
Orr	157	135	143	Warner	137	143	126
Sims	145	123	161	Hostetter	137	154	130
Halderman	182	157	85	Baumer	184	160	140
Total	799	725	722		766	718	701

GORGONA.

About twenty were present in "gym" class on Monday and Thursday nights of last week. Apparatus work has been taken up by both squads and, beginning with Monday, September 18, a more advanced line of work will be adopted.

In the third game contest of the bowling league on the local alleys, the home team took three games from Culebra. Following are the scores:

	1st game.	2nd game.	3d game.
Culebra	703	748	710
Gorgona.	741	839	864

EMPIRE.

The following scores of 200, or over, were bowled during the past week: Duckpins—Rodeghiero, 101, 109, 103, 107, 126; Pulsifer, 105, 101; Danielson, 116; King, 113; Grund, 102. Tenpins—Davis, 216; Giavelli, 222; Snyder, 205; Rodeghiero, 214.

The league games bowled on the local alleys on Saturday, September 16, resulted in Empire winning three games from Camp Elliott, as follows:

Empire.				Camp Elliott.			
Pinney	139	192	174	McDowell	142	133	160
Giavelli	191	194	181	Tripple	105		
Anderson	149	178	153	Clouse	178	166	146
Davis	126	142	144	Austin	139	150	123
Parkis	168	178	147	Martin	120	131	175
				Janke		156	180
Total	773	884	799		684	736	784

Owing to other entertainments during the week, the literary society will postpone the regular meeting. The next meeting will be on Friday night, September 29.

On Sunday evening, September 24, there will be informal singing at 8.30 o'clock.

On Saturday evening, September 16, J. L. Malone ex-champion pool and billiard player of the United States, gave an exhibition on the Empire tables, playing Messrs. Smith, Wood, and Sheets a 200-point game, and winning 200 to 154. At pool, Malone played Pearson and McKeever a 75-point game, the former winning 75 to 48. After the games, Malone gave an exhibition of fancy and instructive shots in both pool and billiards. About 200 men were present.

CRISTOBAL.

A "smoker" will be held on Thursday, September 28.

The subject for debate on Wednesday night, September 27, at the literary and debating club will be "Resolved, that the initiative, referendum, and recall constitute the best form of government for the State."

On Friday night, September 22, J. L. Malone, the pool and billiard expert, will give an exhibition of fancy pool and billiard playing, beginning at 8 p. m. Malone will play against three leading billiard players, combined, in the Cristobal Y. M. C. A., and also against two leading pool players.

On Saturday night, the Gorgona bowling team will bowl at Cristobal.

The scores of the Gatun-Cristobal games bowled here last week are, as follows:

Gatun.				Cristobal.			
Greene	190	158	119	Gibson	143	162	161
O'Meara	197	136	183	Thomas	126	167	148
Chamberlain	203	135	138	Burns, T.	202	168	182
Galloway	202	164	147	Bullard	177	201	162
Barte	209	189	151	Louch	126	199	205
Total	1,001	782	738		774	897	858

GATUN.

The following are the results of the league games bowled at Gatun with the Cristobal team:

Gatun.				Cristobal.			
Hodges.	189	154	138	Barrett	156	201	155
Myers	115	111		Blackburn	209	173	173
DeMoll	166	148	200	Collins	152	173	130
Severn	177	188	168	Rabbitt	140	156	198
Durand	146	142	183	Furlong	136	161	124
Carr			191				
Total	*793	743	880		*793	864	780

*Cristobal won the tie.

Married.

LOST—At Culebra on September 13, a double case gold watch with Canal medal fob. Return to office of the Chairman, Culebra.

OFFICIAL CIRCULARS.

Requests for Sanitation Work.

CULEBRA, C. Z., September 13, 1911.

CIRCULAR No. 183-F-2:

Requests on the different departments and divisions for the performance of sanitary work of the kinds mentioned therein for the Department of Sanitation will, hereafter, be preferred in accordance with the following, and all existing orders inconsistent herewith are to that extent abrogated:

1. Grass and brush cutting on all new areas which have heretofore not been cut, and on areas which have not been cut for the Department of Sanitation by the Quartermaster's Department within two years shall, if the areas exceed two acres in extent, be requested on form C. E. 159, and receive my approval before the work is taken in hand.
2. All new construction work in connection with ditching and drainage, the estimated cost of which exceeds $50, performed by the construction divisions for the Department of Sanitation, shall be requested on form C. E. 159, and receive my approval before the work is taken in hand.
3. All new construction work in connection with ditching and drainage, the estimated cost of which does not exceed $50, performed by the construction divisions for the Department of Sanitation, shall be performed by the former on the request of district sanitary inspectors on form S. D. 47.
4. All maintenance work, *i. e.*, superficial ditching, clearing, repairing of drains, etc., shall be performed by the different divisions promptly on the request of district sanitary inspectors on form S D. 47.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Classified Expenditure Accounts.

EMPIRE, C. Z., September 14, 1911.

CIRCULAR No. 33:

Effective at once, the following classified expenditure accounts are authorized:

Department of Construction and Engineering-General—

351. Lighting and buoying the Canal.

(a) Construction.

To this account will be charged all labor, material, and other expenses incidental to lighting and buoying the Canal, including buoys, beacons, and lighthouses.

(b) Plant.

To this account will be charged all plant heretofore, or hereafter, purchased or used in the work of lighting and buoying the Canal; also charged with plant transferred from, and credited with plant transferred to other divisions.

Fortifications—

501. Armament of fortifications.

To this account will be charged the cost of purchase, manufacture, and test of sea coast cannon for coast defense, including their carriages, sights, implements, and the machinery necessary for the manufacture at the arsenals.

502. Sea coast batteries.

To this account will be charged all labor, material, and other expenses incidental to the construction of sea coast batteries in the Canal Zone.

H. A. A. SMITH, *Examiner of Accounts.*

Approved: GEO. W. GOETHALS,
Chairman and Chief Engineer.

The Canal Record is issued free af charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold rall. Extra copies and back numbers can be obtained from the news stands af the Panama Railroad Company for five cents each.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting infarmation, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Canal Record Index.

The index to Volume 4 of THE CANAL RECORD, in form suitable for binding with the year's issues of the paper, will be ready for distribution shortly. It will be sent free, on application, to such persons, institutions, libraries, etc., as desire to preserve their copies of THE CANAL RECORD in book form. Application should be made to the Secretary, Isthmian Canal Commission, Ancon, C. Z.

Setting Machinery at Locks.

The work of setting machinery for the operation of the locks was begun last week by an organization reporting direct to the Assistant Chief Engineer, under whose direction will be carried on the operations of setting in the masonry of the locks and spillways locomotive tracks, chain fenders, valve machinery, gate machinery, recess covers, bridges, manhole covers, and all parts accessory to mechanical and electrical installation. The first work taken up was the preparation of foundations for the machines that will operate two of the Stoney gate valves on the west wall of the locks at Gatun. A division of duties has been arranged, whereby the forces of the construction divisions will cooperate with the erecting forces of the Assistant Chief Engineer.

The erecting force will lay practically all the rack track for the towing system, that is, the towing tracks and the part of the return tracks on the inclines between the locks. This includes also the installation of the copper rails in side conduits for the transmission of current to the locomotives. It will install the fender chain machines, including eight chains at Gatun, Pedro Miguel, and Miraflores, 24 in all; with 48 machines for lifting and lowering them, 48 centrifugal pumps for operating the hydraulically driven machines, 48 motors for operating the pumps, and 48 sump pumps.

The placing of the Stoney gate and cylindrical valves will be done by the construction divisions or, at their order, by the erecting force, but the machines for operating these valves will be installed by the erecting force. There are 116 of these machines for the Stoney gate valves, and 120 for the cylindrical valves, and one motor for each machine.

Machines for operating the miter gates will be installed by the erecting force. These include 92 mechanisms for operating the gates, and 46 for forcing the miter ends together.

The covers over the miter gate recesses will be installed by the McClintic-Marshall Construction Company, under the direction of the Assistant Chief Engineer. These will be built of steel cantilevers anchored into the masonry of the lock walls, properly braced and decked over with concrete. There will be recess covers over all the gate machines, excepting those for the lower guard gates, 12 in number, the total number of recesses to be covered, therefore, being 80. The covers are necessary in order to take the towing locomotive tracks.

Lock Operations at Miraflores.

The deepest steam shovel cut in the lower lock at Miraflores is down to 46 feet below mean sea level, or within five feet of finished floor grade. Six steam shovels are working in the pit, two of them excavating close to the upper lock sill, and construction of the floor and lateral culvert system will be begun as soon as enough material has been removed from this end. The trenches for the floor culverts will be excavated by hand, locomotive cranes being employed to lift the buckets of material into dump cars. Concrete operations in the upper lock are, at present, confined largely to the west and center walls, and to foundations of the center wall in the forebay. The east wall lacks a few feet only at the north end to complete it nearly the length of the upper lock, with the exception of the niche in it occupied by the auxiliary mixer. The iron work on berm crane "E," the last of the berm cranes to be set up at Miraflores Locks, is finished, and the electricians now have it in charge.

Increased Water Supply.

In order to increase the water supply for the city of Panama, it has been decided to lay a new 20-inch main from the Rio Grande reservoir to replace the 16-inch main now in use, and a requisition for the necessary material for the work has been forwarded. To increase the pressure, without the delay incidental to the laying of this line, it is proposed to install an additional 10-inch discharge pipe from the Cocoli pumping plant to connect with the 16-inch main, which will give two 10-inch discharge lines from the Cocoli reservoir. Heretofore, the two pumps at the Cocoli station have been pumping into one pipe, but as soon as the new main is laid, there will be one pipe for each. It is further proposed to install a 12-inch centrifugal pump, now on hand, to furnish auxiliary pressure to the water flowing through the Rio Grande main. This pump has a rated capacity of 3,500 gallons per minute against a head of 70 feet. It will take the water from the main, and discharge again into the main at some distance from the intake under an increased pressure, thus acting as a "booster" pump.

New pumping equipment has been recommended for the Cocoli station, the installation of which, it is believed, will completely relieve the present situation. This equipment is planned to consist of two motor-driven pumps capable of supplying 1,500 gallons of water per minute against a head of 300 feet. Later, this plant can be transferred to Ancon, and used to increase the facilities there, which are becoming inadequate owing to the heavy water consumption from the high pressure reservoir on Ancon Hill.

Stockade on Empire-Chorrera Road.

A stockade has been built by the Division of Public Works on the new Empire-Chorrera road, about four miles out of Empire, for the housing of the convicts, and the accommodation of their guards, during the construction of the road to the Canal Zone boundary line. The building is situated at one end of a spacious yard, irregular in shape, formed by the leveling off of the top of a knoll, and stands at an elevation of about 45 feet above the bed of the Mandingo River, which partly encircles the hill. The yard is enclosed by an 8-foot double fence, spaced four feet apart, affording a passageway for the officer on patrol. Each fence is strung with close rows of barbed wire on both sides, making four thicknesses in all, and over the top there has been placed slanting barbed wire guards to prevent the inmates from climbing out of the enclosure. The total length of the outside fence is about 700 feet.

The building is 35 by 150 feet in size, and its walls are constructed of native material; the uprights consist of young trees, felled in the vicinity, averaging eight inches in diameter, on which cross pieces of the same material, averaging four inches in diameter, have been fastened with 6-inch iron spikes. The outward sides of the walls, up to within three feet of the roof, are covered with canvas as a protection from the weather. The space between the canvas and the roof has been left open for light and ventilation, but is screened in. The interior of the building is divided into two cells, a living room for the white officers, another for the colored officers, a separate living room and office for the corporal in charge, a dining room, kitchen, an individual cell for refractory prisoners, and a store room. The cells are of equal size, 35 by 44 feet, and open upon a corridor, six feet wide, from which the prisoners pass at one end, into the dining room and at the other end

NOTES OF PROGRESS.

(Continued.)

to the yard outside. They are situated between the quarters for white and colored officers, and are provided with Standee berths in rows of three, occupying the center of the room, so that there is space to move about on all sides. The rows of berths are arranged so that they can open in each direction. Each of the cells will have sleeping accommodations for about 70 men, or a total of 140 in all, and about this number will be employed on the road. There are also outside entrances to both the white and colored officers' quarters.

Supplies will be packed on horseback from the Culebra penitentiary, and water will be pumped by hand from a nearby creek into two tanks within the stockade. The road has been completed for a little over two of its six miles of distance.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is about 70 per cent completed, 156,406 cubic yards, out of a total of 225,000, having been placed at the close of work on September 23. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
September 18	164	7.30	1
September 19	172	11.30	2
September 20	156	7.30	1
September 21	138	6.00	1
September 22	146	6.30	1
September 23	108	6.00	1
Total	884	45.00	1.16
Previously reported	155,522		
Grand total	156,406		

Ancon Crusher.

A statement of rock crushed at Ancon quarry during the two weeks ending September 23. follows:

DATE.	Hours worked.	Cubic Yards.
September 11	7.10	2,340
September 12	7.00	2,489
September 13	6.45	2,554
September 14	7.05	2,260
September 15	7.10	2,336
September 16	5.50	2,332
Total	41.00	14,311

DATE.	Hours worked.	Cubic Yards.
September 18	7.20	2,782
September 19	8.05	2,422
September 20	7.30	3,250
September 21	7.15	2,676
September 22	8.20	3,014
September 23	7.55	2,658
Total	46.25	16,802

Visit of Congressmen.

It is expected that a party of United States Senators will visit the Canal work during the last week of October, and the early part of November.

The Committee on Appropriations of the House of Representatives will leave New York on or about November 8 for a visit to the Isthmus, during which time it will conduct hearings on the estimates of appropriations needed for the Canal work in the fiscal year 1913.

It is expected that the House of Representatives Committee on Interstate and Foreign Commerce will visit the Isthmus during the early part of December.

Excavation Record in Culebra District.

On September 20, twenty-one shovels, working in the Culebra construction district of the Central Division, excavated 37,203 cubic yards of rock and earth during the working day of eight hours, an average per shovel for every shovel working in the district, of 1,771.6 cubic yards per day.

The shovels were under steam 168 hours; at work 121 hours and 25 minutes, and waiting for cars 33 hours and 5 minutes. The rest of the time—13 hours and 30 minutes—was lost in repairing shovels, cleaning track, cleaning dipper, mining, repairing track, moving shovel back, etc.

CONCRETE WORK IN THE LOCKS.

About 66 per cent of the concrete for all the locks is in place, the amount at the close of the work on September 23, being 2,765,774½ cubic yards, out of a total of approximately 4,199,400. A total of 33,579½ cubic yards of concrete was laid in the locks during the week ending September 23.

GATUN LOCKS.

Over 80 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on September 23, being 1,611,067½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending September 23, and of the total, follows; and a similar statement for the work in the Spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

EXECUTIVE ORDERS

Establishing the Postal Savings System in the Canal Zone—Prohibiting Placing of Signs.

By virtue of the authority vested in me, I hereby establish the following Order for the Canal Zone:

Section 1. There is hereby established in the post-offices of the Canal Zone a postal savings system, to be operated without the payment of interest on the deposits, under such rules and regulations as may be now or hereafter adopted.

Section 2. There is hereby created a Board of Trustees for the control, supervision, and administration of the postal savings depository offices designated and established under the provisions of this Order, and of the funds received as deposits at such postal savings depository offices by virtue thereof. Said board shall consist of the Collector of Revenues of the Canal Zone, the Auditor of the Canal Zone Government, and the Treasurer of the Canal Zone, severally, acting *exofficio*, and shall have power to make all necessary and proper regulations for the receipt, transmittal, custody, deposit, investment, and repayment of the funds deposited at postal savings depository offices; the regulations above mentioned to be subject to the approval of the Chairman of the Isthmian Canal Commission.

Section 3. Said Board of Trustees is hereby authorized and empowered to designate such post-offices as it may select to be postal savings depository offices, and each and every post-office so designated by order of said Board is hereby declared to be a postal savings depository office within the meaning of this Order, and to be authorized and required to receive deposits of funds from the public, and to account for and dispose of the same, according to the provisions of this Order and the regulations made in pursuance thereof. Each postal savings depository office shall be kept open for the transaction of business during such hours as the Collector of Revenues shall direct.

Section 4. That accounts may be opened and deposits made in any postal savings depository established under this Order by any person of the age of ten years or over, in his or her own name, and by a married woman in her own name, and free from any control or interference by her husband; but no person shall at the same time have more than one postal savings account in his or her own right.

Section 5. At least one dollar, or a larger amount in multiples thereof, must be deposited before an account is opened with a person depositing the same; and one dollar, or multiples thereof, may be deposited after such account has been opened. Postal savings deposits will be evidenced by postal savings certificates issued in fixed denominations of $1, $2, $5, $10, $20, $50, $100, each bearing the name of the depositor, the number of his account, the date of issue, and the name of the depository office.

Section 6. Any depositor may withdraw the whole or any part of the funds deposited to his or her credit upon demand, and under such regulations as the Board of Trustees may prescribe.

Section 7. Postal savings funds received under the provisions of this Order shall be deposited with the Treasurer of the Canal Zone, under such regulations as the Board of Trustees may prescribe.

Section 8. Postal savings depository funds shall be kept separate from other funds by postmasters and other officers and employes of the postal service, who shall be held to the same accountability under their bonds for such funds as for public moneys; and no person connected with the Post-Office Department shall disclose to any person other than the depositor the amount of any deposits, unless directed so to do by the Collector of Revenues.

Section 9. That the final judgment, order, or decree of any court of competent jurisdiction adjudicating any right or interest in the credit of any sum deposited by any person with the postal savings depository, if the same shall not have been appealed from, and the time for appeal have expired, upon submission to the Collector of Revenues of a copy of the same, duly authenticated in the manner provided by the laws of the United States for the authentication of the records and judicial proceedings of the courts of any state or territory, or of any possession subject to the jurisdiction of the United States, when the same are proved or admitted within any other court within the United States, shall be accepted by the Board of Trustees as conclusive of the title, right, interest, or possession so adjudicated; and any payment of said sum in accordance with such order, judgment, or decree shall operate as a full and complete discharge of the United States and the Canal Zone Government from the claim or demand of any person or persons to the same.

Section 10. This Order shall take effect and be in force sixty days from and after this date.

Wm. H. Taft.

The White House,
September 8, 1911.

To Prohibit the Placing of Signs on Lands and Property of the United States and the Panama Railroad Company.

By virtue of the authority vested in me, I hereby establish the following Executive Order for the Canal Zone:

Section 1. It shall be unlawful for any person to construct or place any sign, bill, poster, or other advertising device on any land, building, or other structure owned or controlled by the United States or the Panama Railroad Company in the Canal Zone; and any person thus offending shall be punished by a fine of not less than five dollars, nor more than twenty-five dollars, or by imprisonment in jail not to exceed thirty days, or by both such fine and imprisonment in the discretion of the court; and every day that such sign, bill, poster, or other advertising device shall remain upon such lands or structures shall be deemed a separate offense. *Provided*, however, that this Order shall not be construed to prevent persons from advertising by means of any such advertising devices the business that they may be conducting according to law in any building or other structure upon which such advertising device is constructed or placed.

Section 2. This Order shall take effect sixty days from and after this date.

Wm. H. Taft.

The White House,
September 8, 1911.

Hebrew Benevolent Society—Day of Atonement.

Divine service will be conducted at the Sojourners' lodge room, Colon, on Sunday evening, October 1, at 6.15 o'clock, and on Monday morning, October 2, beginning at 8.15 o'clock. All Jewish residents of the Canal Zone are cordially invited.

PERSONAL.

Captain Courtland Nixon, accompanied by his mother, Mrs. J. B. Nixon, leaves on the *Zacapa* on Thursday, September 28, for New York, on his annual leave of absence.

Assignment of Teachers.

The assignment of teachers of the white schools for the school year beginning October 1, 1911, has been made, as follows:

Ancon—Jessie E. Daniels (principal), Frederika Hine, Emma M. Cobban, Virginia Best, Clara L. Voyles, Gertrude B. Hoffman, Jessie W. Clark.

Pedro Miguel—Ruth Hall (principal), Dove L. Prather, Blanche A. Bradley.

Paraiso—Grace E. Snediker.

Culebra—Mildred O. Bates (principal), Jennie M. Dunlap, Hattie L. Hawley.

Empire—Elise Cage (principal), Grace Yarborough, Jessie H. Whyte, Helen L. Daniels, Mary M. Shea, Ida O. Erickson.

Las Cascadas—Shellie M. Dunn.

Bas Obispo—Clelia D. Crespi.

Gorgona—Grace E. McCray (principal), Effie L. Powers, Marian Patterson, Marion Sukeforth.

Gatun—Charles C. Carr (principal), E. D. Christopherson, Alberta Hawley, Ida H. Bowles, Odina J. L. Frost, Cora Sessions, Annie E. Stone, Wenonah A. Whiting.

Cristobal—M. Edith Anderson (principal), Edith MacIntyre, Jessie C Pontius, Helen C. Nason, Inez Cox, Lucile Annis.

Substitutes—Georgia T. Munroe, Dora Nielsen.

School Brake Schedule.

The school brakes at the different points along the line will follow the schedule given below until further notice:

The Balboa-Ancon brake will leave Balboa at 8.30 a. m.

The Corozal-Ancon brakes will leave Corozal at 8 a. m.

The Paraiso-Pedro Miguel brake will leave Paraiso at 8 a. m.

The Las Cascadas-Empire brake will leave Las Cascadas at 8 a. m.

The first Colon Beach-Cristobal brake will leave Colon Beach at 8 a. m., and the second Colon Beach-Cristobal brake will leave Colon Beach at 8.30 a. m.

The afternoon brake service at Colon Beach-Cristobal will continue as last year.

Notice of Teachers' Meetings.

White teachers of the public schools will meet at the Ancon schoolbuilding on Saturday, September 30, at 8 a. m.

Colored teachers will meet at the Ancon schoolbuilding on Saturday, September 30, at 2 p. m.

Sailing of the "Cristobal."

The steamship *Cristobal* will sail from New York on Wednesday, October 4.

The Red Men's Social Club of Empire will give an informal dance at Kangaroo hall, Empire, on Saturday evening, September 30.

Roy E. Payne was killed in the Lake Shore yards at Cleveland, Ohio, on August 15, 1911, and George Payne, his father, who is supposed to be on the Isthmus, is requested to communicate with his family.

FORTIFICATION WORK.

Preparatory Work on Flamenco Island.

The preparatory work in connection with the fortification of Flamenco Island in Panama Bay has been begun, and about 60 men are now employed there, which number will be augmented as operations are increased. A steam shovel and a French locomotive have been landed, and the track is being laid for the shovel to begin excavating. It will dig its way a short distance up the steep side of the hill by the "switchback" method, and, upon reaching the desired position on the slope, it will excavate a bench or level, after which the rock mass will be dislodged in much the same manner as at Ancon quarry. The material thus loosened will be loaded into dump cars, four of which will be transported by barge to Flamenco this week, and will be used for filling purposes. In prosecuting operations at the summit of the island, a tramway will be built to the top over which narrow gage dump cars can be run.

The most important items of preparatory work at present, are the construction of a dock for unloading supplies, and the building of a causeway that will connect Flamenco, Perico, and Naos Islands, and eventually, all three with the mainland, by means of the breakwater. The causeway will be 20 feet wide across the top, of sufficient width for a railroad track and footpath, and will have an elevation of 20 feet above mean tide. It will be extended to Perico Island in nearly a direct line, thence along the shore of that island on a 10-degree curve until it reaches the natural sand bar crossing to Naos, which shows above water at low tide, and which will be utilized in the present work.

The dock will be in the shape of a right angle, one section paralleling the beach for a distance of 200 feet, and the other extending directly out into the sea for a distance of 150 feet. It will be faced with a concrete wall four feet thick, and, on the land side, will be filled in with selected material on a level with the railroad track to be laid along the shore. The section extending seaward parallels the proposed causeway, and will be filled in between, giving a space 110 feet wide. As the top of the dock will be only 15 feet above mean tide, and the causeway will be 20 feet, the floor of the dock will have a gradual slope. The dipper dredge *Cardenas* is now engaged in dredging out the site of the dock to bed rock, which is found at a depth of from 25 to 30 feet below mean tide. After it has finished dredging at this point, it will be set at work excavating an approach channel to the dock for a width of 200 feet, and a depth of 25 feet, for the use of tugs and barges loaded with supplies.

The employes are housed in the old buildings on Naos Island, formerly the property of the Pacific Mail Steamship Company, and alterations are being made in some of them to fit the new conditions. One of the larger buildings will be utilized for an office hotel, and kitchen on the lower floor, and for quarters for "gold" bachelor employes on the second floor. There are also two married quarters, a house for the superintendent, a barrack for laborers, storehouse, blacksmith shop, carpenter shop, etc. The machine shop, one of the largest buildings on the island, may be dismantled, its equipment having recently been disposed of at private sale. Quarters have already been provided for 60 men, and accommodations are being installed for 50 more. Telephone service has not yet been installed, but connection with the mainland will probably be effected through the submarine cable to the quarantine station on Culebra Island. Water is obtained from the tanks on the island, which will shortly be replaced with larger ones, and a tank is being set up on Flamenco to supply the equipment there. The food supplies are conveyed to the Naos Island camp by the supply boat *Chame* of the Pacific Division dredging fleet.

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending September 23, follows:

Date.	Hours worked.	Cubic Yards.
September 18	4.14	1,954
September 19	4.46	2,004
September 20	3.58	1,718
September 21	4.23	1,978
September 22	2.35	1,300
September 23	4.52	1,994
Total	24.48	10,948

Postal Business and Canal Zone Revenues.

The report of the Director of Posts for the month of August shows that there were 17,239 money orders issued, amounting to $420,193.89. Of this amount, $319,212.76 was issued payable in the United States, $100,110.13 in the Canal Zone, $611 in Martinique, and $260 in Costa Rica. The fees amounted to $1,859.22, and the amount of orders paid and repaid was $114,685.16.

Postal sales during the month amounted to $5,977.00, and newspaper postage to $1.60.

The revenue collections for the month were, as follows:

Distillation licenses	$65.70
Bicycle and chauffeur licenses	95.00
Motor vehicle licenses	22.00
Taxes, licenses, etc	7,434.60
Total	$7,617.30

Obituary.

Henry P. Coe, a naturalized American, employed on barge *No. 7* in the Atlantic Division, died at Colon Hospital on September 18 of hæmoglobinuric (blackwater) fever. He was born at Grand Cayman, was 49 years of age, married, and had been on the Isthmus nine months. The interment took place in Mount Hope cemetery.

Robert Grier, the four and one-half year old son of Mr. and Mrs. Wm. Grier of Culebra, while playing on the edge of a pool in the Culebra Cut on September 18, fell into the water and was drowned.

LABOR FORCE AND QUARTERS IN AUGUST.

The total force at work on the Canal and railroad on August 30 was 35,648, as compared with 34,681 at the end of July, 1911; with 35,867 in August, 1910, and 26,519 in August, 1909. Canal employes numbered 28,872, and railroad employes 6,776. The number of "gold," or white American employes, was 4,141, compared with 1,250 in July, 1911, and with 4,445 in August, 1910. The force report for August 30, follows:

Department.	SILVER EMPLOYES.*														Total Gold	Grand Total

QUARTERS.

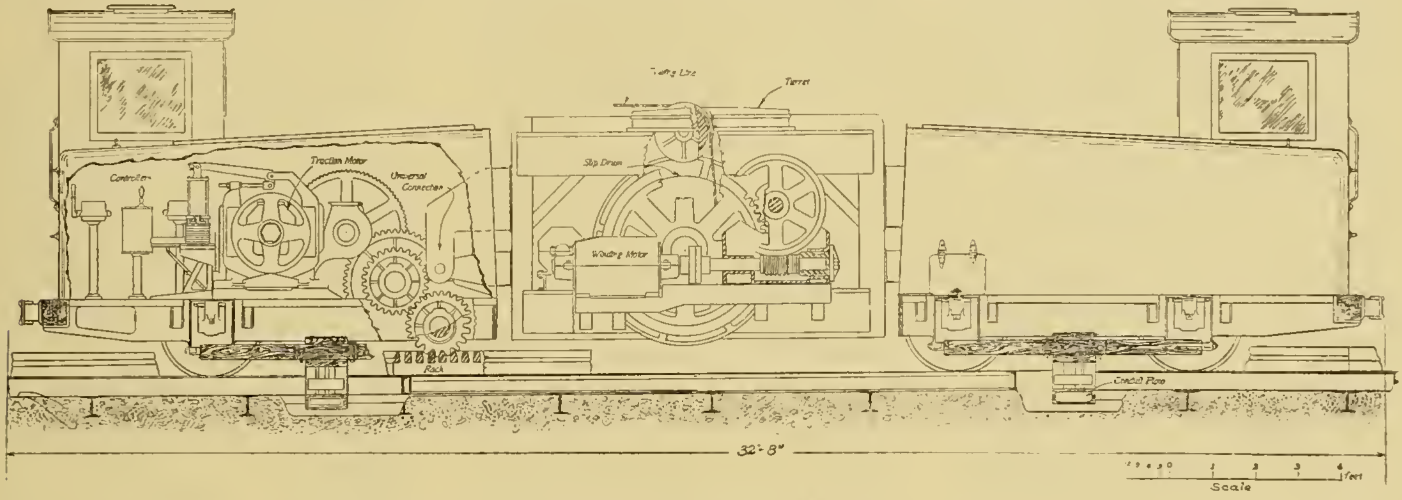
On August 30, there were 23,833 occupants of Commission quarters. Of these, 9,198 were white Americans; 5,240 were men, 2,016 women, and 1,942 children. There were 5,532 Europeans of the laborer class, of whom 4,934 were men, 250 women, 348 children. There were 9,103 West Indian negroes, of whom 6,662 were men, 1,060 women, and 1,381 children. Included in the above were 82 Asiatics, 45 East Indians and 103 Panamanians.

TOWING LOCOMOTIVES.

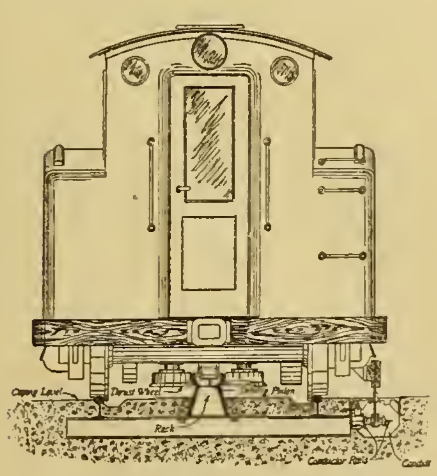
Method of Towing Ships Through Locks—Bids for Locomotives.

Specifications and plans for the locomotives which will tow ships through the locks have been sent to the Washington office, in order that bids may be asked for the forty locomotives that will be required for the locks at Gatun, Pedro Miguel, and Miraflores. The system of towing outlined in the specifications is the invention of Edward Schildhauer of the Canal engineering staff, and patent has been applied for, the Government having the right to use the patent without remuneration. Two bids will be called for, one for one locomotive for test purposes, and the other for the remaining 39, in case the first is satisfactory.

The system of towing provides for the passing through the locks of a ship at the rate of two miles an hour, the vessel being held steady between four lines of taut hawsers. A ship will come to a full stop in the forebay of the locks, where four hawsers will be attached to it, two forward on either side and two aft. At their other ends, these hawsers will be attached to the windlasses of four towing locomotives operating on the lock walls, two forward towing, and two aft being towed by their hawsers, thus holding the ship steady. The locomotives will run on a level, excepting where they pass from one lock to another, where they will climb heavy grades. Between the lower and intermediate locks at Gatun, for example, there is a difference in elevation of 29 feet 7 inches, and, in order to save concrete, this ascent is made in the shortest feasible distance. The horizontal distance from the point of tangency on the lower lock wall to the point of contact on the wall of the intermediate lock is 106½ feet. The vertical curve has a radius of 100 feet, and the maximum grade is one on two.



ELECTRIC TOWING LOCOMOTIVE.
SIDE VIEW. One tractor showing housing, one tractor and the windlass unit without housing, showing the machinery with certain parts omitted to depict the more clearly the working features.



ELECTRIC TOWING LOCOMOTIVE.
END VIEW. Showing rail system with rack rail in center and power rail on side in open conduit.

There will be two systems of tracks, one for towing, and the other for the return of the locomotives when not towing. The only crossovers between the tracks will be at each end of the locks, and there will be no switches in the rack road. The tracks will be of the 5-foot, Panama railroad gage, laid with 90-pound Bessemer steel rail on Carnegie steel ties, each tie anchored into the concrete by a bolt on the side farthest from the lock chamber. On the center wall there will be two towing tracks with one return track between them, and on each side wall a towing and return track. The towing tracks will have a center rack throughout, and the locomotive, while towing, will always operate on this rack. On the return tracks, at the incline between locks they will also operate on racks, but elsewhere they will run by friction. The racks will be of cast steel, so formed that lubricant will not drop upon the concrete, and that water will not be held in the interstices, this latter precaution being taken against the breeding of mosquitoes. The distance from center to center of adjoining teeth is 3.13 inches. After hauling the ship through the last gates, and into the forebay, the locomotives will coil their cables and return to await another ship, or will take hold of a vessel going in the opposite direction, and tow it through.

Each locomotive will consist of three parts, as shown by the drawings reproduced on this page—two tractors, and between them, a windlass. The windlass will not be mounted upon a truck, but will be supported by two arms extending on each side from either end and resting on bearings immediately over the rear wheels of the tractors. The ends of these arms will be equipped with rollers to permit free horizontal movement of the members when the locomotive is rounding a horizontal curve. The windlass is joined to the tractors by a drawbar and trunnion which have the effect of a universal joint, and permit free movement of the parts when the locomotive is on a vertical curve.

TRACTORS.

The tractors will be alike in every particular each consisting of a four-wheel truck upon which are mounted a motor and a control apparatus. They will run as rack or friction locomotives at the will of the operator, and the whole locomotive can be controlled from either cab.

While towing, and on the inclines between the locks, the tractor will run as a rack locomotive. Motion is communicated from the motor to the rack pinions by means of a system of gear reduction in which there are no clutches. There is absolutely no means of disconnecting this train of gears, and, as a result, the rack pinions are in motion only when the motors are. A solenoid brake, which closes upon a brake wheel whenever the current is cut off from the motors, provides against accident in case the current should be cut off while the locomotive is on one of the inclines. In such an event, the locomotive would come to a stop instantly, and be held there until the brake should be released. The rack pinions are of quill construction, and are so mounted upon the back axle of each truck, that the rack pinion will run free from the motor when the locomotive is on the return track, and traveling by friction.

For traveling by friction, the tractors will be fitted with jaw clutches, which will connect the traction motors with the driving wheels. These clutches will be operated by solenoids. The locomotive, when operating by friction, will move at a rate of five miles an hour.

The electrical equipment for each tractor will consist of one traction motor with control apparatus. The motor will have a full speed torque of 840 pounds at one foot radius, full load speed at no less than 470 revolutions per minute, and will be capable of developing not less than 75 per cent greater torque for a period of one minute. Alternating current will be used with the effect that synchronous speed will be maintained on all the locomotives in a tow. The motor will be 3-phase, induction, totally inclosed, moisture proof, high torque, or mill type, 25 cycles per second, with 220 volts between lines. The motors on the tractors of each locomotive will be operated in parallel, and controlled by resistance in the secondary circuit, accomplished by contactors in the primary and secondary circuits operated by master controllers, one in each cab. There will be not less than seven power points in each direction and between these and the braking position, there will be a coasting point, so that when power is turned off from either forward or reverse direction, there will be available a coasting point before the braking position is reached. The master controllers will be of the drum type, one for each tractor.

Current will be collected by each tractor by means of a plow carrying two contact shoes, each operating on a separate power rail carried in an open conduit, one for each of two phases, while the third phase will be carried by both track rails. The maximum load that will be thrown upon the traction motors will occur when the locomotive is ascending the inclines between the locks, and this will be greater than the load of towing a ship. Inasmuch as weight is not required for tractive effort, the whole locomotive will be of light construction as possible, the estimated weight being 70,000 pounds.

WINDLASS.

The third part of the locomotive will be a windlass for hauling in or paying out the towline, and motors to drive it. The drum will be 18 inches in diameter. A friction clutch will provide against it ever sustaining a pull of more than 25 000 pounds. Two speeds are provided for, one for coiling in the line under load at a rate of ten feet a minute, and the other for coiling it when not under load, at a rate of 200 feet per minute. Rotary switches in the cabs of each tractor will control the movement of the windlass.

There will be two motors, one for operating the windlass under load, and one for the rapid coiling of the hawser. The windlass motor will have a full speed torque of 120 pounds at one foot radius, will be capable of fifty per cent greater torque for one minute, and will have a full load speed of not less than 630 revolutions per minute. The coiling motor will have thirty pounds torque at one foot radius, be capable of exerting fifty per cent greater torque for one minute, and will have a full load speed of 630 revolutions per minute. These motors will be of the squirrel cage type, but otherwise will have the same classification as the motors in the tractors.

The towing line will pass through a sheave in a revolving turret, which will permit it to rotate easily in a horizontal plane, so that the line load may always be directly on the guiding sheave. The tow line will be of plow steel wire, composed of six strands of 37 wires each, will have a hemp center, and will be one inch in diameter. The wires must have a tensile strength of not less than 225,000 pounds per square inch, and the hawser must have an ultimate breaking strength of not less than 70,000 pounds. There will be a 4-foot loop at the ship end, and the length of the line from the center of this loop to the drum of the windlass will be 215 feet.

All the machinery, for both windlass and tractors, will be housed in a steel casing. The housing of the windlass will consist of a steel frame covered with 3-16-inch steel plate. The top sheeting must be capable of standing a strain of 85 pounds per square foot, and the upper side edges of the housing must be capable of sustaining a concentrated load of 12,000 pounds, which may be placed upon it when the tow line is used to warp a vessel up to the lock wall, and the line is at right angles to the locomotive, and the chock of the ship is considerably below the locomotive.

The Dennis Relief Fund.

Supplementing the statement of the fund for the relief of Mrs. L. R. Dennis, published in THE CANAL RECORD of September 6, the committee in charge of the fund on the Isthmus wishes to announce to the many subscribers that letters and statements have been received from various persons in Washington denying in whole the newspaper story to the effect that Mrs. Dennis and her children arrived in that city in a destitute condition. A letter from Mrs. Dennis states that she had cash in her pocket, and a money order for $60 available upon her arrival at Washington, and that she never stated to any one that she was destitute, or in any danger of want.

Benefit for the Late Captain Hammond.

The committee that has in charge the subscription for the benefit of the widow of the late Captain Edwin Hammond of the Panama railroad steamship line, announces that the list will be closed on September 30, and a draft for the amount collected will be sent to Mrs. Hammond. No money will be received after that date. Members of the committee are requested to send their lists and collections to Mr. W. G. Ross, Empire, C. Z., not later than September 30.

Civil Service Examinations.

Examination will be held, probably on October 29, for stenographer and typewriter in the Isthmian Canal and Philippine services, and for typewriter in the Isthmian Canal service. Applications therefor will be received until October 25. The kind of examination desired should be stated in requesting information in regard to the above.

In answer to the question in application forms as to *bona fide* residence, applicants are required to show such residence up to the date of application. It is to be noted that *bona fide* residence does not require continuous bodily presence, but refers to the place at which an applicant, if a voter, is legally entitled to vote.

JOHN K. BAXTER, *Secretary,*
Isthmian Civil Service Board.

CULEBRA, C. Z., September 29, 1911.

Misdirected Letters.

ANCON, C. Z., September 27, 1911.

The following insufficiently addressed letters, originating in the United States and its possessions, have been received in the office of the Director of Posts, and may be secured upon request of the addressee:

Alveralo, Mrs. Falona
Fitzgerald, Emmett
Gauthier, A.
Gorman, Miss Mary
Gorman, Will E.
Hahn, Charlie F.
Hardt, Henry O.
Hickey, John
Hoffman, John, Jr.
Hoffman, Warren E.
James, Jos. H.
Kesner, C. M.
McDonald, Mrs. Iris
Miller, J. B.
Palmer, R. M.
Parks, Fred M.
Peters, F. C.
Smith, Fred C.
Suart, H. V.
Titus, W. L. (pkg.)
Torres, Leonidas
Von Deleigh, Mrs. Alice
Wentsler, H. E.

Auction Sale of Calves.

On Saturday, October 7, 1911, at 10 a. m., there will be sold at public sale to the highest bidder at the Ancon Hospital dairy, three or four calves, about one month old. The dairy is located near the insane asylum in the rear of the hospital grounds. The terms of the sale will be cash.

Family Quarters.

Applications for married quarters were on file on September 1, as follows:

DISTRICT.	List No 1.	List No. 2.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The schedule of moving picture entertainments for the week of October 2 to 7, follows: Monday, Culebra; Tuesday, Corozal; Wednesday, Empire; Thursday, Gorgona; Friday, Gatun; Saturday, Cristobal.

CULEBRA.

On Monday night, an exhibition in pool and billiards was given by J. L. Malone, the pool expert. In billiards, he played Messrs. Dubois and Thomson, winning by a score of 158 to 116. In pool, he played Messrs. Fleischman and Stevens, winning by a score of 77 to 58. After the games, Malone gave an exhibition of fancy shots.

On Tuesday night, the quartermaster's team defeated the "All stars" in volleyball, winning three games.

At the motion picture entertainment on Friday night, Mr. Weston from Cristobal furnished vocal and instrumental music.

On Saturday night, the Empire bowling team took three games from Culebra on the home alleys. Following are the scores:

Culebra.				Empire.			
Sickler	113	129	134	Pinney	161	173	167
McIlvaine	124			Giavelli	185	191	168
Fox		124	153	Anderson	175	184	154
Fleischman	163	164	138	Davis	143	114	154
Dougherty	176	180	181	Parkis	161	156	183
Baumer	117	155	141				
Total	693	752	747		825	818	826

GORGONA.

On Monday night, September 18, the gymnastic class, after the regular gymnasium work, had a group picture taken in the gymnasium. About twenty men were present. These pictures will be on sale the latter part of this week. In the hygiene class, the subject of "Diet" was discussed.

Two hundred and fifty people witnessed the moving picture show on Wednesday night, September 20. The next will be on Saturday night, September 30.

At the membership "smoker" on Saturday night, September 23, a program was rendered, consisting of orchestral music; songs by Messrs. Kelly, Ringger, Kramer, Robitoy, and Dr. Funk; monologues by marines from Camp Elliott; ballad, Mr. Gardner; dancing, Mr. Zelinski; club swinging, Mr. Kramer; burlesque, Messrs. Patterson and Emery; chalk sketching, Mr. Shaw; songs, quartet from Camp Elliott. The Gorgona indoor baseball team was presented with the Isthmian championship trophy for the season 1910-11, A. B. Dickson making the presentation. The membership contest was closed with Perry's team in the lead.

In the bowling at Gorgona on Saturday night, September 23, Gorgona took three games from Cristobal, the score being, as follows:

	1st game.	2d game.	3d game.
Cristobal	763	693	682
Gorgona	765	728	699

One hundred and twenty-five people attended the monthly song service held last Sunday evening. The Rev. Mr. Compton of Panama delivered the address; Mr. Thos. Gardner sang a solo, and Mrs. R. C. Shady played the piano.

EMPIRE.

The following scores of 200, or over, were bowled during the past week: Tenpins—Pinnery, 200, 213, 202; Mitchell, 224; Snyder, 202; Davis, 216; Spinks, 202; Pearson, 200; Parkis, 244, 203, 200, 217. Duckpins—Grund, 112; Reiman, 105.

The league games bowled on Empire alleys on Saturday night, September 23, resulted in Empire winning two out of three games from Culebra. Following are the scores:

Empire.				Culebra.			
Gustavson	190	164	146	Herrington	134	158	140
Spinks	180	167	212	Warner	136	157	132
Gorham	174	142	173	Driscoll	156	117	151
Pearson	160	169	157	Mengel	142	203	143
Huson	146	144		Case	185	174	168
Drake			147				
Total	850	786	835		753	809	734

The regular meeting of the literary and debating society will be held on Friday night, September 29, subject "What is socialism?"; leader, Mr. Morrison of Cristobal.

A pool and billiard tournament will be started on October 2, and all those interested are requested to leave their names at the desk.

On Sunday evening, October 1, there will be an informal song service at 8.30 o'clock.

GATUN.

On Wednesday night, September 20, Louis DePoorter, champion pool player of the Isthmus, played and defeated J. L. Malone, the pool expert. The score was 150 to 136. Mr. DePoorter also made the highest run of 19 balls, Mr. Malone's high run being 14 balls. Following the pool match, a "smoker" was held in the hall, at which there were recitations, acrobatic work, chalk cartoons, and orchestra music. Ice cream, punch, and sandwiches were served. Mr. Malone concluded the evening's entertainment with an exhibition of fancy pool and billiard shots.

Until further notice, Mr. Jess Hopkins will conduct the physical classes on Tuesday and Thursday evenings, with basketball practice on Tuesday evening, following the gymnasium class.

There will be a match game of basketball between the Pacifics and the Atlantics of the McClintic-Marshall Company on Saturday evening, September 30. E. M. Cooper will captain the Pacifics, and J. F. Minotti the Atlantics.

Forty-five new books were placed on the library shelves recently. Among them are a large Webster's unabridged dictionary, and a Rand-McNally atlas of the world. Another order will be sent to the States this week.

The Gatun bowling team defeated the Camp Elliott team on Saturday night, winning three games. Scores were, as follows:

Camp Elliott	701	764	619
Gatun	784	796	757

At Camp Elliott, the Gatun team won two out of three games. Scores, as follows:

Camp Elliott	750	753	746
Gatun	737	782	779

CRISTOBAL.

An audience of 230 witnessed the match games and fancy shots in pool, and billiards, on Friday evening, September 27, when J. L. Malone met Messrs. Wehmeier and Davis in pool, Mr. Malone winning by the score of 75 to 53. Mr. Mosher was matched with Mr. Malone in billiards, with a handicap of 50 points in a 200-point game, and the latter won by the score of 200 to 105. He also gave an exhibition of fancy shots.

A motion picture entertainment will be given on Friday night, September 29; members free; other adults 25 cents; children 15 cents. Mr. Weston will furnish special vocal music, and Mr. Glick will play the piano.

The medals won by the Cristobal members in the recent Isthmian duckpin league tournament will be presented at the "smoker" on Thursday night, September 28.

The Camp Elliott bowling team will bowl three tournament games at Cristobal on Saturday night, September 30, and a team from Cristobal will also bowl at Camp Elliott the same evening.

An open program will be presented on Wednesday evening, October 4, by the literary and debating club. The entertainment will be a political rally, at which presidential candidates of the various parties will be nominated.

The bowling team from Gorgona played the Cristobal team on Saturday night, losing three games to Cristobal. Following are the scores:

Gorgnna.				Cristobal.			
Otis	166	143	151	Barrett	187	168	184
Sims	162	171	161	Thomas	143	190	146
Arnold	158	155	136	T. Burns	177	165	186
A. Burns	110	156	124	Collins	171	164	158
Haldeman	198	191	122	Louch	169	186	193
Total	794	816	694		847	873	867

LOST—Between Colon and Gorgona on Sunday, September 17, a Masonic watch charm in the shape of a locket. Finder please return to John Gray, care of I. C. C. Band, Cristobal.

CLASSIFIED EXPENDITURES.

A statement of classified expenditures of the Isthmian Canal Commission to July 31, follows:

OFFICIAL CIRCULARS.

Captain of the Port.

CULEBRA, C. Z., September 22, 1911.

CIRCULAR No. 410:

Mr. J. St. C. Hunt is hereby appointed Captain of the Port of Ancon, and Mr. S. Layland is appointed Captain of the Port of Cristobal.

GEO. W. GOETHALS, *Chairman.*

Checking and Delivering of Cement.

CULEBRA, C. Z., September 25. 1911.

CIRCULAR No. 335-A:

Circular No. 335, dated June 10, 1910, providing method for checking and delivering cement, is hereby modified, as follows:

1. Hereafter, cement for the Atlantic Division shall be checked in the ship's hold by checkers for the Atlantic Division and Panama Railroad.
2. The Panama railroad shall receive credit for all overages shown. The Depot Quartermaster shall keep a running account of charges for shortages, against which he can credit overages, if such obtain, and on June 30, and on December 31, of each year, he shall render an account pertaining to the six months immediately preceding.
3. The records of all checks of cement delivered to the Atlantic and Pacific Divisions shall be sent direct to the Panama railroad. Set cement pertaining to each cargo shall be surveyed by the Surveying Officer immediately after discharge of cargo. The complete outturn of the cargo, as attested by the two divisions and the Surveying Officer, and accepted by the Panama railroad, shall then be forwarded to the Depot Quartermaster, who will accomplish bills of lading for the Commission on the data submitted.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Chief Clerk, Atlantic Division.

GATUN, C. Z., September 22, 1911.

TO ALL CONCERNED:

Effective this date, Mr. Ben Jenkins is appointed Chief Clerk of the Atlantic Division, vice Mr. R. M. Sands, resigned.

WM. L. SIBERT, *Division Engineer.*

Rates for Water at Colon and Cristobal.

PANAMA RAILROAD COMPANY,
OFFICE OF GENERAL SUPERINTENDENT,
COLON, R. P., September 22, 1911.

Notice dated July 29, 1911, quoting rates on water supplied vessels at Colon and Cristobal, is hereby cancelled.

Effective at once, the following rates will apply:

500 gallons, or less	$2.50
501 to 1,000 gallons	3.00
1,001 to 1,500 gallons	3.50
1,501 to 2,000 gallons	4.00

All over 2,000 gallons, $1 for each additional 1,000 gallons.

F. MEARS, *Acting General Superintendent.*

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Las Cascadas, C. Z., on Sunday, October 1, 1911, at 6 p. m. The program follows:

1. March—*Ideal*........Reeves
2. Selection—*The Spring Maid*........Reinhardt
3. Romance—*A Tale of Two Hearts*........Roberts
4. Overture—*Jolly Robbers*........Suppe
5. Flower song—*Hearts and Flowers*........Tobani
6. Waltz—*Casino Tanze*........Gung'l
7. (*a*) Two step—*Billy*........Kendis
   (*b*) —*Chicken Reel*........Daly
8. Medley selection—*Rossiter's Popular Songs*..Alford
9. Characteristic Morceau—*On Tiptoe*........Hosmer
10. March—*Arbitrator*........Bagley

CHARLES E. JENNINGS, *Musical Director.*

The next concert will be given at the Hotel Tivoli, Ancon, C. Z., on October 8, at 7.30 p. m.

The following vessels arrived at, or departed from the port of Balboa during the week ending September 23:

Arrivals—September 17, *Mantaro*, from Callao; September 18, *Guatemala*, from Callao; September 20, *City of Sidney*, from San Francisco; *Manavi*, from Buenaventura; September 21, *Chile*, from Guayaquil; September 22, *Tampico*, from San Francisco.

Departures—September 18, *Peru*, to Guayaquil; *Pachitea*, to Callao; September 19, *Quito*, to Guayaquil; September 21, *Limari*, to Valparaiso; September 23, *Mantaro*, to Callao.

LOST—On Sunday September 17, either at Empire station, or on train to Colon, ribbon watch fob with monogrammed locket set with a diamond—monogram "G. C." Finder return to Geo. Clark, Empire, C. Z., and receive reward.

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Culebra, 8 a. m. to 1 p. m., and 3 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning September 21.

Supplies for Canal Work.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal and Colon during the two weeks ending September 23:

Prinz Sigismund, September 10, from New York, with 10 cases harness oil and 40 cases black paint for stock.

Arminster, September 11, from Baltimore, with 1,700 kegs spikes, 2,062 pieces drill casing, 625 bundles steel bars, 20,325 cases dynamite, 8 cases paint, 137 kegs bolts, 1,546 pieces steel rail, 358 barrels sulphate alumina, 50 barrels lump alum, for stock.

Panama, September 11, from New York, with 132 pieces white oak lumber, 18 pieces steel plates, 500 kegs track spikes, 11 pieces steel bars, 12 bundles wicker baskets, 4 barrels varnish, 12 cases paint, 33 cases paper, 7 cases spelter, 6 cases range parts, for stock; 20 cases insulating tape, 1,000 bundles bolts, 12 bags bolts, 13 cases incandescent lamps, for Mechanical Division; and a miscellaneous cargo, the whole consisting of 2,080 packages, weighing 125 tons.

Oruba, September 10, from New York, with 12 cases electrical material for stock.

Abangarez, September 14, from New Orleans, with 32 bundles washers for Pacific Division; 23 bundles doors for Panama Railroad Company; 7 cases scythe stones, 1,293 bales hay, 70 pieces white oak lumber, 3,912 pieces siding, 4,581 pieces yellow pine lumber, for stock; 5,152 pieces car siding, 3,036 pieces car roofing, for Mechanical Division.

Metapan, September 14, from New York, with 26 bales air brake hose, 60 pieces switches, 125 pieces frogs, 50 bundles steel tubes, 6 cases rubber hose, for stock.

Ancon, September 16, from New York, with 10 barrels electrical material for Atlantic Division; 13 barrels fire brick, 13 barrels ferro manganese, 80 barrels copper ingots, for Mechanical Division; 29 pieces steel castings for Central Division; 25 kegs nuts, 30 bales wool waste, 25 cases ink, for stock; 124,960 bags cement for Atlantic and Pacific Divisions.

Advance, September 18, from New York, with 150 cases ivory soap, 8 crates mop handles, 833 bundles corrugated roofing, 20 pieces switches, 107 cases salt water soap, 7 cases ticking, 34 barrels rosin, 85 kegs spikes, 10 bales rubber hose, 19 cases envelopes, 30 cases rough castings, 10 cases putty, 50 cases varnish, for stock; 14 cases books, 10 cases school supplies, for Department of Civil Administration; 28 cases caskets, 10 cases drugs, for Sanitary Department; and a miscellaneous cargo, the whole consisting of 1,505 packages, weighing 165 tons.

Zacapa, September 21, from New York, with 32 cases electrical material for Atlantic Division; 40 cases brake shoes for Mechanical Division; 202 pieces steel beams for stock.

Atenas, September 21, from New Orleans, with 704 pieces yellow pine lumber, 51 pieces white oak lumber, 314 bundles flooring, for stock; 107 pieces ties for Pacific Division; 12 cases castings, 387 tons pig iron, for Mechanical Division; 17 cases school supplies for Department of Civil Administration.

Prinz Eitel Friedrich, September 23, from New York, with 500 bundles wire for stock; 13 cases desks, 22 cases desk fittings, for Department of Civil Administration.

MOVEMENT OF OCEAN VESSELS.

The following is a list of the sailings of the Panama Railroad Steamship Company; of the Royal Mail Steam Packet Company; of the Hamburg-American Line, and of the United Fruit Company's Line; the Panama Railroad Company's dates being subject to change.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Joachim* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct, leave on Thursdays at 3 p. m.; ships for New Orleans in the coastwise service on Thursdays at 4 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

The Leyland line steamer *Louisinian* sails for New Orleans direct on or about September 28.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, OCTOBER 4, 1911. No. 6.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Excavation in Culebra Cut.

The excavation in the Central Division for the month of September, aggregated 1,361,445 cubic yards, of which 1,340,173 cubic yards were taken from the Culebra section, known as Culebra Cut. This is the highest September record in the Culebra section since the commencement of operations on the Isthmus by the United States.

Lights for the Pacific Entrance

A requisition has been made on the Washington office for two light apparatuses for the towers forming range 9-11 at the southeast end of the tangent, extending from Balboa to Miraflores in the Pacific entrance to the Canal. The towers are nearing completion. It is proposed to install lights in which acetylene gas is absorbed under pressure by acetone, the acetone itself being soaked up by a mechanical absorbent to prevent the escape of a bubble of gas under pressure, an occurrence possible if the acetone is in the reservoir in its liquid state. Buoys with this type of light are used satisfactorily both in Europe and in the United States. One of these lights will be equipped with the Dalen sun valve in order to see whether or not the valve would be economical under the night and day conditions existing on the Canal Zone. Locomotive headlights in stock on the Isthmus will be used with the gas burners. Tentatively the characteristics for the front and rear lights will be—front light, 0.3 seconds light, 0.7 seconds dark; rear light, 1.0 seconds light, 1.0 seconds dark. The temporary equipment in range 9-11 will give a service capacity of six months for each light.

Excavation Between Mindi and Gatun.

The suction dredge *Sandpiper* began excavating on September 30, in the Canal prism between Mindi hills and Gatun locks, where it is estimated that four and three-quarter million yards of material must be removed. At present, the dredge will excavate towards the steam shovel pit at Mindi. It is expected that the dry excavation at Mindi will be completed about January 1, 1912, then the suction dredge will break into the pit from the southward, and the ladder and dipper dredges at work in the Atlantic entrance will enter it from the north. Before that time the 18-inch suction dredge, now excavating sand at Nombre de Dios, will be towed to Gatun and set at work with the *Sandpiper* in this section of the Canal. All the material excepting a small hill just south of Mindi, and an undetermined but small amount of rock immediatly north of the north caisson sill of Gatun locks, can be removed by the suction dredges.

In the lower lock at Gatun the concrete layers are at work on the last of the piers, against which a bulkhead will be built to keep water from the lock chambers, while a suction dredge is excavating for the foundations of the north guide walls and in the north forebay of the locks. After all the material that can be taken out by this method has been removed, the forebay will be unwatered, in order that the guide and flare walls may be built in the dry. The remaining excavation will probably be done by dipper dredges.

Testing Lock Machine Motors.

A shed has been erected near the locks at Gatun in which motors purchased for the operation of the lock valve machines are given tests for the climatic conditions on the Isthmus. Shop tests are now in progress in the States, where the motors will be put through a working trial with one of the valve machines now ready at the works of the Wheeling Mold & Foundry Company. Eight motors were purchased from three manufacturers, out of a total of 236 required, and on the result of the tests in the States and the climatic tests on the Isthmus the general order will be given. The object of the test on the Isthmus is to determine which type of motor will best stand the deteriorating effects of the climate. Upon their arrival, the motors were placed in the dry room of the storehouse at Gatun, and there the insulation resistance was measured at regular intervals for a week, and after storage in the dry room, it was measured further at intervals of twenty-four hours.

The tests include (1) the measuring of insulation resistance of the motors and the application of a 1,500-volt high potential test for one minute; (2) measuring of insulation resistance just prior to turning on steam and at intervals of six hours thereafter; (3) removal of handhole covers to admit saturated steam to the room so that the air is at a temperature of 50 degrees centigrade; (4) subject all motors to a high potential test of 1,000 volts ten seconds every twenty-four hours. These tests will be continued for one week. If the data do not show any decided results, the tests will be continued, but in a temperature of 75 degrees centigrade. In addition the motors will be immersed in water at normal air temperature, and the insulation resistance will be measured just prior to immersion and after immersion. At intervals of six hours for two days just prior to removal from the water a high potential test of 500 volts will be applied for ten seconds.

If these tests do not show conclusive results internal heat will be applied by running the motors on regular pressure or at higher pressure to produce the desired heating effect. This test will show the rapidity with which the moisture in the insulation will be driven off, and will also render the insulation more porous and finally weaken it as to its insulating properties.

At the Pacific Entrance.

Clapet *No.* 5, formerly a part of the Pacific Division dredging fleet, has been converted into a tank vessel, and will be used in storing water at Flamenco Island. It was rebuilt in 1900, and continued in the dredging work until 1910, when it was placed out of commission. The hoppers in the hull of the vessel have been sealed up with concrete, and will be used as tanks, holding altogether about 300 tons of water.

Clapet *No.* 6 is on the shipways undergoing repairs to its hull. It was rebuilt in 1905, and has been in continuous service since then.

The dredges at the Pacific entrance are now working wholly in rock, the mud deposits in the part of the channel where they are excavating, having been removed with the exception of those created by silting. The dredges are now working in the Canal, south of the site of the new cofferdam.

Slides at Gatun Locks.

Part of the earth bank behind the east wall of the lower lock at Gatun sank on the morning of September 29, and rose up a few feet away. The movement was apparently caused by the rock fill which carries the tracks on which the cableway towers run, and only a few hours before the sinking occurred one of the towers was on the section which fell. The lock wall has been constructed at this point to a sufficient height to keep the moving earth from sliding into the lock chamber, and no difficulty was experienced from this source. But the work of repairing the track fill took four days, and the concrete laying in the lower locks was delayed by that much. Only a week before, a similar sinking under the cableway tracks occurred on the west side of the locks.

These movements of the earth at the lower locks began about a year ago. They are due entirely to the nature of the soil which overlies the firmer earth and rock upon which the locks are founded. It is singularly lacking in coherency and moves on a very flat slope. As a result the excavation in the lower locks was continually hampered by sections of the banks falling or sliding into the pit. The total

NOTES OF PROGRESS.

(Continued.)

amount of material that has moved in this manner is probably not over fifty thousand cubic yards, yet it has retarded excavation, and consequently the laying of concrete. The most serious consequence has been that it has caused a four month's delay in the completion of the cofferdam across the lower end of the locks behind which suction dredges are to excavate for the north forebay and the wing walls. The piers for this bulkhead are now nearing completion. In the laying of concrete the slides have had the effect of limiting the space in which the cableways can operate over the lock chamber, and thus of restricting the amount that can be placed. It was believed that when the walls were completed to a height to keep the banks from sliding into the lock chamber, all the trouble would be past; but the movement of the light soil under the fills necessary for the cableway tower tracks has introduced a new difficulty, which although not serious may continue to retard the work in the lower locks.

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending September 30, follows:

Date.	Hours worked.	Cubic Yards.
September 25	4.26	1,853
September 26	4.01	1,782
September 27	4.48	1,992
September 28	4.10	1,829
September 29	4.51	1,982
September 30	4.57	1,959
Total	27.13	11,397

Ancon Crusher.

A statement of rock crushed at the Ancon quarry during the week ending September 30, follows:

Date.	Hours worked.	Cubic Yards.
September 25	7.50	2,857
September 26	6.45	3,317
September 27	7.45	2,805
September 28	6.40	2,575
September 29	6.55	2,619
September 30	7.40	2,782
Total	43.35	16,955

Gatun Dam Spillway

The concrete work in the Spillway of Gatun Dam is about 70 per cent completed, 157,074 cubic yards, out of a total of 225,000, having been placed at the close of work on September 30. A statement of the amount laid each working day last week, and of the total in place, follows:

Date.	Concrete Laid.	Hours worked.	No. Mixers.
September 25	102	6.00	1
September 26	128	7.00	1
September 27	96	5.30	1
September 28	142	7.00	1
September 29	100	6.00	1

Total	668	37.30	1
Previously reported	156,406		
Grand total	157,074		

Improvements at Railroad Station in Panama.

A shed will be placed over the platform at the railroad station in Panama to protect persons alighting from and boarding passenger trains from the showers which are so frequent during the rainy season. The shed will extend from the hospital car gate to the last of the exits for first-class passengers, thus including all exits. It will be 605 feet long, 24 feet wide, and 14 feet high at the eaves, and will be built of iron frame and corrugated iron roof. Shelters will extend from the platform to the exits, and also to the gates through which passengers go to take the train. A shelter, 40 feet long and 20 feet wide, will be built on the street side of the railway station, in front of the entrance to the waiting room for first-class passengers, to the end that persons may alight from coaches and enter the station without being subjected to rains.

CONCRETE WORK IN THE LOCKS.

Over 66 per cent of the concrete is in place, the amount at the close of work on September 30, being 2,796.170 cubic yards, out of a total of approximately 4,199,400. A total of 33,396 cubic yards of concrete was laid in the locks during the week ending September 30.

GATUN LOCKS.

Over 81.5 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on September 30, being 1,624,039½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending September 30, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers.			Large stone.	Total.

*Includes 11 cubic yards laid by hand.

EXECUTIVE ORDERS.

Special Commissioner on Industrial and Commercial Value of the Canal.

By order of the President, Professor Emory R. Johnson is hereby appointed a Special Commissioner for the purpose of bringing up to as late a date as practicable the data contained in the Report of the Isthmian Canal Commission for 1899-1901 relative to the industrial and commercial value of the Isthmian Canal, and also to formulate rules and regulations governing the measurement of ships going through the Canal and to make an investigation and recommendation regarding the tolls to be charged. Until his report is forthcoming Professor Johnson will be allowed his actual expenses and fifteen dollars a day including Sundays and holidays. Upon the completion of Professor Johnson's work the Secretary of War will finally fix his entire compensation.

Henry L. Stimson,
Secretary of War.

War Department,
September 1, 1911.

Removal of Packing or Waste from Journal Boxes of Railroad Equipment.

By virtue of the authority vested in me I hereby establish the following Order for the Canal Zone.

Section 1. Any person who shall without lawful authority take or remove the packing or waste from out of any journal box or boxes of any locomotive engine, tender, coach, caboose or truck, used or operated on any railroad, shall be guilty of a misdemeanor, and upon conviction shall be sentenced to pay a fine not exceeding One Hundred Dollars, or imprisonment in jail not exceeding thirty days, or both fine and imprisonment, in the discretion of the court.

Section 2. This order shall take effect sixty days from and after this date.

Wm. H. Taft.

The White House,
September 14, 1911.

Pilots, Mates, Masters, Engineers, Chauffeurs.

Examinations for pilots, mates, masters, and engineers; and for chauffeurs, will be held by the Board of Local Inspectors at the Administration Building, Ancon, on October 11. All applicants for licenses as chauffeur must secure from the Department of Civil Administration, Executive Office, Ancon, forms of application, and information respecting the filling out of the same, not later than the day previous to the examination. All applicants for examination must be present at the Administration Building at 8:00 a. m. on October 11, with papers in proper form. In addition, applicants for chauffeurs' licenses must demonstrate their capacity properly to operate an automobile, and must have the automobile with them.

Oil Pipe Line Changes.

On Monday, September 11, the Union Oil Company abandoned its line along the old railroad right-of-way from Barbacoas bridge, near San Pablo, to Gatun, a distance of about 18 miles, and no oil will be pumped across the Isthmus until the completion of the oil company's new line, which will parallel the Panama railroad relocation from Caimito Junction to Gatun. About two miles of line have already been laid at each end of the gap, leaving 65,000 feet, or nearly 13 miles to be placed. The crossover from Barbacoas bridge, where the old line now terminates, to Caimito Junction on the railroad relocation, has been built, and is ready for service. The construction work between Caimito Junction and Gatun will be begun at once, working from the south end, and using the material removed from the old pipe line. It is believed that the work of closing the gap on the relocation can be accomplished in two and one-half to three months, depending on weather conditions. There has been placed in storage in the tanks at Mount Hope, oil to the amount of 110,000 barrels, equivalent to a four months' supply for the works at that end of the Canal, at the present rate of consumption. The amount of oil in the tanks at Petrolia will shortly be increased to 150,000 barrels, making the total amount in storage on the Isthmus upward of 260,000 barrels.

During the month of August, deliveries to the Commission aggregated 74,413 barrels, or a little less than the April, 1911, deliveries, which are the largest made in any one month to date. The deliveries to the Commission during the current year, at the present rate of consumption, will considerably exceed those for any year previous since oil began to be used as fuel on the Canal works. The record of deliveries, by months, from January 1, 1911, to September 1, from the oil company's tanks, follows:

Months.	I. C. C.	Others.	Total.
January	62,640	1,195	63,835
February	72,939	4,797	77,736
March	66,766	4,911	71,677
April	74,930	2,527	77,457
May	72,020	3,225	75,245
June	71,032	6,269	77,301
July	69,228	2,983	72,211
August	74,413	4,044	78,457
Total	563,968	29,951	593,919

The total deliveries of oil from the Union Oil Company's tanks on the Isthmus during August exceeded the record for any previous month.

Three ships are now engaged in the oil carrying trade to the Isthmus, the *Pectan* of 65,000 barrels capacity, and the *Trinculo* and *Oberon* of 45,000 barrels capacity each. A new vessel is now under construction in English yards, which will be chartered by the oil company as an addition to its fleet. It will be completed early next year, and will be of practically the same capacity as the *Pectan.*

Dredge No. 6 to be Destroyed.

Ladder dredge *No. 6*, which sank in the Atlantic entrance to the Canal, near the intersection of the French Canal, on June 19, will be destroyed. A diver is now at work taking off such parts as may be utilized to advantage on the other dredges and, after it has been stripped, the hull with its ladder will be blown up by dynamite. The pieces will be taken from the Canal channel by one of the crane boats and stored on the island opposite the Mount Hope marine shop.

This dredge was built in Scotland and brought to the Isthmus by the old French company for dredging in the entrance to the Canal at Cristobal. It was taken from the storage bay for floating equipment at Folks River in 1905 and, after partial repairing, was used for about a year. In 1908 it was placed in dry dock and the hull was repaired, after which it was returned to work in the Atlantic entrance, where it was operated for a period of eighteen months before repairs were again necessary. It was thoroughly overhauled in the fall of 1909, and continued in the service without extensive repairs until the time it sank. At that time there were only two caretakers on board, and the investigation held soon afterwards did not determine the cause of the accident. It was first planned to raise the dredge, but an examination of the hull showed that the plates were in such bad condition that they probably would not stand the severe strain incident to righting it. On this account its destruction was decided upon.

Steam Shovel Record for One Year on P. R. R. Relocation.

On September 7, 1911, steam shovel No. 257 completed a year of continuous work on the Relocation of the Panama Railroad. This shovel came out of Empire Shop and commenced work September 8, 1910. It has loaded more or less material every one of the 304 working days between those dates, and in eight of the calendar months included in this period, has held the record for yardage on the Isthmus. The following table shows in detail the work done:

Month	Output by cross-section.		
	Earth	Rock	Total
1910.	Cu. Yds	Cu. Yds	Cu. Yds
September	2,725	37,030	39,755

July	62,540	74.6	25
August	76,030	80.3	27
September	15,200	76.9	5
Total	733,550	72.3	304

Note:
Average output per day, 2,351 cubic yards.
Output for September, 1911 (5 days) taken from car report.
Working days are eight hours.

Until April, 1911, this shovel was taking out main line cuts on the steep side hill south of Gatun, the height of the bank being generally over 100 feet, and running up to 165 feet. Under these conditions slides interfered more or less with the work. Since April the shovel has been in a borrow pit. Throughout the year the material was argillaceous sandstone, similar to that found in the Gatun lock site. The output has been loaded into 10 yard dump cars. J. H. LaRowe has been engineer on this shovel during the entire year with W. E. Reader, E. E. Austin and others as craneman. Handling of trains, shifting the shovel, drilling and blasting has been in charge of C. G. Jones, supervisor. The shovel is a 103 ton model with 5 yard dipper.

TRAFFIC BY PANAMA ROUTE.

Freight Increase of Twenty-Two Per cent—Tonnage at Entry Ports—Passenger Business.

Freight tonnage by the Panama railroad increased 22.39 per cent during the year ending June 30. 1911, over that for the previous fiscal year. The revenue tonnage, that is freight exclusive of that carried for the railroad company, increased 23.04 per cent. The increase was in both freight carried southbound and northbound, and represents all traffic except that to Panama from the United States and to San Francisco from Europe in the southbound trade, and that from Panama to the United States and from Central America and Mexico to the United States in northbound traffic. The following statement summarizes the tonnage for the fiscal year 1911, as compared with that of 1910:

	1911	1910	Increase
Southbound (to Panama)...	1,178,560	991,856	18.82
Northbound (from Panama).	378,470	280,361	34.99
Total.........	1,557,030	1,272,217	22.39

Statements of freight tonnage handled during the years 1911 and 1910, showing origin and destination, follow:

Total........	....	1,699	1,338	361	26.98	.....	......
Balboa and Panama........	All	243	212	31	14.62	......	......

The revenue freight, including both merchandise and coal amounted to 1,523,681 tons, an increase of 285,300 tons or 23.04 per cent. The total revenue derived from this traffic was $2,398,177.88 an increase of $25,605.94 or 1.08 per cent. Company freight amounted to 33,349 tons, and there were carried 3,449 tons of mail and baggage. 2,909 tons of express, which are included in the totals quoted. Of the freight tonnage 75.69 per cent was southbound, and 24.31 northbound, as compared with 77.96 and 22.04 per cent for the previous year. The through freight tonnage was 36.42 per cent of the total handled as against 30.60 per cent in 1910. Coal, including that for the company, comprised 49.53 per cent of the local traffic southbound.

Freight southbound from various sources shows the following increases:

From New York, Philadelphia, and Gulf ports to—

	Tons.
South Pacific ports........	10,881
San Francisco........	50,026
Central America and Mexico........	6,337
Panama........	*3,085

Panama........	3,427
Central America and Mexico........	2,527
San Francisco........	*230

*Decrease.

In the northward direction the following increases are shown:

To New York, Philadelphia and Gulf ports, from—

	Tons.
South Pacific ports........	1,014
San Francisco........	82,026
Panama........	*850
Central America and Mexico........	*1,186

*Decrease.

To Europe from—

South Pacific ports........	2,902
San Francisco........	1,262
Panama........	328
Central America and Mexico........	15,158

A statement showing the number of passengers carried on the railroad and earnings follows:

CLASS.	1911	1910	Increase Per cent
First........	696,688	627,397	11.04
Second........	1,715,466	1,600,172	7.21
Total.......	2,412,154	2,227,569	8.29

The gross revenue from the transportation of passengers was $686,991.25, a decrease of 3.52 per cent from 1910, while the number of passengers carried shows an increase of 184,585, or 8.29 per cent. The revenue received from through passengers shows an increase of $6,542.24, or 20.92 per cent, and the number of through passengers an increase of 2,563, or 36.56 per cent. There was a decrease of 4.64 per cent in revenue from local passengers, and an increase of 8.20 per cent in the number carried.

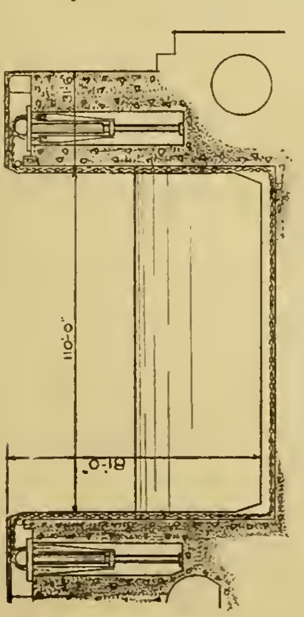
FENDER CHAINS.

Method of Operating Chains That will Guard Approach to Lock Gates.

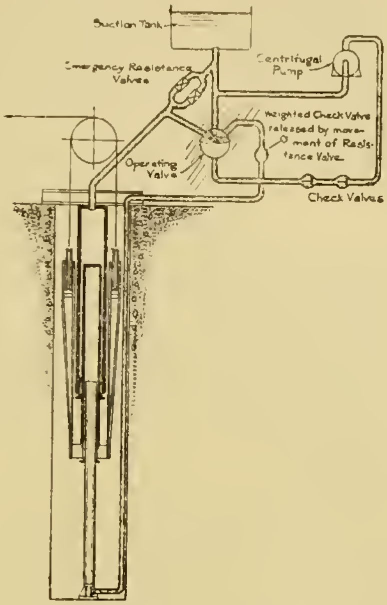
Proposals have been requested for materials for chain fenders for all the locks, and bids will be opened at the Washington office on November 14. Included in the proposed contract are castings for hawse-pipe, cylinders and detail parts, certain structural materials, operating valves, piping and fittings from cylinders to pump and tank, and mechanism for starting and stopping the pump. Parts not included are the main pumps and motors and all electrical machinery and wiring, chains, suction tanks, resistance valves, stairways and gratings, drainage pumps, their motors, piping etc., also riveted steel anchorages attached to hawse-pipe castings.

The function of the fender chains is to prevent the lock gates (used as a bulkhead or dam across axis of locks to form a higher level of water, which may have no corresponding amount of water against them on the downstream side), from being rammed by a ship that may approach too near the gates under its own steam or by escaping from the towing locomotives. They will therefore be placed on the up-stream side of the following gates: Gatun—Upper guard gates, intermediate and safety gates of the first or upper locks. Pedro Miguel—Upper guard, intermediate and safety gates. Miraflores Locks—Upper guard, intermediate and safety gates of the upper locks. At the lower end of each flight of locks are guard gates, mitering in an opposite direction from the lock gates, whose function is to keep water from the chamber between these gates and the lower operating gates, in case it is desired to pump water from this chamber for the purpose of repairing or painting the lower lock gates. In front of these guard gates chain fenders will also be stretched. In all 24 fender chains and 48 machines will be required.

In operation the chain will be stretched across the lock chamber from the top of the opposing walls, and when it is desired to allow a ship to pass, the chain will be lowered into a groove made for the purpose in the lock floor. It will be raised again after the ship passes. The raising and lowering will be accomplished from both sides by mechanism mounted in pits or chambers in the lock walls as shown in sketches, herewith. This mechanism as designed consists of a hydraulically operated system of cylinders, and a train of sheaves by which one foot of movement by the cylinder accomplishes four feet by the chain.



CROSS SECTION OF LOCKS
Showing Fender Chain in position for passing of ships, and situation of Cylinder Pits.



Suction Tank
Emergency Resistance Valves
Centrifugal Pump
Weighted Check Valve released by movement of Resistance Valve
Operating Valve
Check Valves

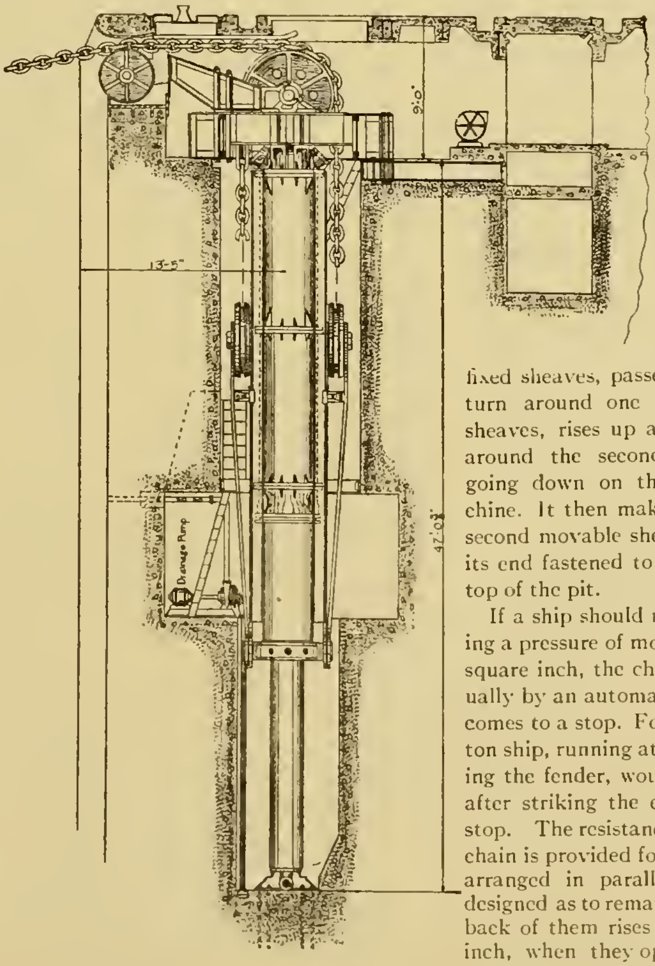
SKETCH SHOWING GENERAL LAYOUT OF FENDER CHAIN OPERATING MACHINERY.

The system of cylinders consists of one fixed cylinder 40 inches in diameter, one cylinder 38 inches in diameter moving within this, and a fixed plunger 25 inches in diameter upon which the smaller cylinder moves. The cylinder is actuated by water forced into the large cylinder for downward motion or raising the chain, and into the small cylinder for upward motion or lowering the chain. This change of flow is produced by varying the position of the operating valve by means of a solenoid operated by remote control. A large open tank provides storage for the water displaced in the outer cylinder as the moving cylinder rises, and also makes up for the waste due to leakage and evaporation. The stroke of the cylinder is 21 feet 6 inches, and each complete movement therefore raises or lowers the chain 86 feet for each machine, or 192 for both. The operating pressure is 60 pounds per square inch.

Water is forced into the cylinders by a centrifugal pump, situated in the pit, which is started automatically by a quick-acting electric switch, operated by a system of rods and levers, actuated by a stop fastened to the guide yoke attached to the moving cylinder. This mechanism also prevents any considerable movement of the cylinder through leakage, insuring the continued maintenance of the chain in its upper or lower positions.

The smaller cylinder carries two sheaves by means of eyebars attached to a crosshead at its lower end. Two similar sheaves at right angles to the lower ones are carried in stationary bearings supported on riveted girders spanning the pit. The chain passes through a hawse-pipe casting in the lock wall, which is secured to heavy riveted anchorages embedded in the concrete. A riveted strut connects the horizontal girders with the hawse-pipe casting, so that the entire outward pull of the chain is transferred to the anchorages.

The chain is supported on an idler fastened to the hawse-pipe casting, then makes a quarter turn around one of the fixed sheaves, passes down and makes a half turn around one of the lower movable sheaves, rises up again, making a half turn around the second stationary sheave and going down on the other side of the machine. It then makes a half turn around the second movable sheave and, passing up, has its end fastened to one of the girders at the top of the pit.



ELEVATION SHOWING CYLINDERS, PLUNGER, AND SHEAVES.

If a ship should run into the fender, exerting a pressure of more than 750 pounds to the square inch, the chain will be paid out gradually by an automatic release until the vessel comes to a stop. For instance, a ten thousand ton ship, running at four knots an hour, striking the fender, would travel 72 feet 6 inches after striking the chain before coming to a stop. The resistance to the paying out of the chain is provided for by two resistance valves arranged in parallel. These valves are so designed as to remain closed until the pressure back of them rises to 750 pounds per square inch, when they open automatically maintaining a constant pressure, and hence stress, on the chain.

REVOLVER MATCHES.

Results of Pistol Practice by Police and Culebra Clubs.

The United States Revolver Association championship match held at Culebra on September 23, 24 and 25, synchronously with the national matches in the United States, resulted as follows:

Possible Scores	A 500	B 500	C 750	D 250	F 250
Name					
L. D. Cornish...	414	438	541	198	167
C. B. Larzelere..	391	434	504	169	161
Jacob Bernson ..	386	430	311	154	124
M. W. Fox.....	394	426	......	......	127
T. E. L. Lipsey..	357	......	......	......	105
John Acors.....	......	......	353	......	......
J. B. Cooper....	......	......	282	......	......
L. A. McIntyre.	......	......	241	......	......

REMARKS:—Match A was for revolvers; Match B for pistols; Matches C and D for military revolvers, rapid fire, 5 shots in 15 seconds; and Match F for pocket revolvers, 5 shots in 30 seconds.

The finals in the pistol tournament for the Canal Zone police were shot off at Gorgona on the afternoon of September 23 the ten men who had qualified making the following scores:

Order. Merit	NAME.	Rank.	SCORE.		
			Bulls-eye target.	Moving target.	Aggregate.
1.	John W. Maddera	1|c. pol.	65	36	101
2.	Leo. A. McIntire.	Corporal	62	39	101
3.	John Acors......	1|c. pol.	65	30	95
4.	James L. Wood...	1|c. pol.	56	35	91
5.	Arthur Flood....	1|c. pol.	55	31	86
6.	Walter F. Doby..	Corporal	65	18	83
7.	William Cooney..	1|c. pol.	55	27	82
8.	George W. Lewis.	Lieut.	56	26	82
9.	B. F. Merryman..	1|c. pol.	52	19	71
10.	A. G. Belknap...	Inspector	54	13	67

The tie between Maddera and McIntire was shot off, and the match was won by Maddera. He was awarded a bronze medal about the size of a peso, containing on its face an enameled pistol between the words "Police" and "Canal Zone," and on the obverse, "Highest score, 1911," with a blank for the name of the winner. The trophy was offered by the Chief of Police.

This tournament is the first of the semi-annual practice matches that have been arranged for the police force, which is comcomposed of 153 officers and first-class policemen, and 116 second-class, or negro policemen. The preliminaries consisted of an instruction practice, and a record practice. In the record practice there were two classes—target and moving figure shooting. The distances were 15, 25, and 50 yards, the time limit for five shots at the bullseye target thirty seconds, and at the moving figure ten seconds. The targets were made up, as follows:

Bullseye target—Is a rectangle 6 feet high by 4 feet wide. Black circular bullseye, 8 inches diameter, value of hit, 5; center ring, 26 inches diameter, value of hit, 4; inner ring, 46 inches, value of hit, 3; outer, remainder of target, value of hit, 2. A ricochet has the same value as a direct hit.

Moving target—Silhouette of a man in the standing position on a rectangular target, 4 by 6 feet, the feet of the silhouette resting on the lower line of the target. Value of hits, direct or ricochet: On figure, 5; on target, outside of figure, 2. The moving target is suspended from a taut wire across an open space from two clumps of brush, the nearest point at which it appears being 15 yards away from the position in which the contestant stands, the farthest, 50 yards distant; distance traveled by the figure in the open, 40 yards. The figure is drawn across the open space away from the marksman at the rate of 40 yards in ten seconds, and back again at the same rate, the effect being to simulate a man running from, and toward the marksman while making for cover. The Colt's service revolver and ammunition are used.

PERSONAL.

Maj. T. C. Dickson will arrive on the Isthmus, from his annual vacation leave, on the *Panama*, due October 5.

The Hon. Nicholas Longworth, Member of Congress from Ohio, accompanied by his wife, is making a visit of one week to the Isthmus. They will return to the United States by way of New Orleans on Thursday the 5th instant.

Justice of the Supreme Court.

Mr. William H. Jackson, who has been Senior District Judge since June 5, 1911, has been appointed Associate Justice of the Canal Zone Supreme Court and assumed office on September 29. He will preside in the Court of the Second Circuit at Empire. The Supreme Court now consists of H. A. Gudger, Chief Justice, and Associate Justices Thomas E. Brown, Jr., and William H. Jackson. It has a full membership for the first time since December, 1910.

Arrival of 10th Infantry.

The Tenth Regiment of Infantry, U. S. A., arrived on the Canal Zone on Wednesday morning, having embarked at Galveston, Tex., on September 26, from Fort Sam Houston.

Temporary barracks have been provided in canal quarters at Las Cascadas. The regiment, as it arrived on the Zone, consists of 33 officers and 813 enlisted men. Col. Henry A. Greene is in command. The other officers are Lieut. Col. Blauvelt, Maj. Chas. Gerhardt, Maj. J. H. Ford, M. D., Capts. Lawrence D. Cabell, Q. M., Ralph E. Ingram, Frederick W. Coleman, Ethelbert L. D. Breckenridge, Jas. J. Mayes, S. W. Widdefield, R. C. Humber, Wm. Taylor; First Lieuts. John B. Shuman, Walter L. Reed, Jesse Gaston, Wm. F. Harrell, Fitzhugh B. Allderdice, Gordon R. Catts, Andrew J. White, Chas. F. Conry, H. B. Jones; Second Lieuts. John B. DeLancey, Avery B Cummings, Ebenezer G. Beuret, Lewis C. Rockwell, Wm. J. Fitzmaurice, John H. Stutesman, Robt. L. Eichelberger, Herbert E. Marshburn, Fred B. Carrithers, F. B. Grey, Harry R. Kutz.

Second Lieutenants Philip B. Fleming, John W. Stewart, Joseph C. Mehaffey, Paul S. Reinecke, and Raymon A. Wheeler of the Corps of Engineers, U. S. A., have been assigned to duty on the Canal work from November 25, 1911, to June 15, 1912.

Sanitation of Golden Green.

Temporary sanitation of the village of Golden Green, near Culebra, will be accomplished by the installation of six concrete lined waterproof vaults, instead of a sewer system. The cost will be borne equally by the Panama railroad, on whose land the village is situated, and the Canal Zone Government. The cost of maintenance will be borne by the railroad company. Permanent provision in the shape of a sewer system is not made at this time, because it is believed the village will cease to be occupied to so large an extent as at present, when the Canal is in operation, and the railroad is on the east side of Culebra Cut.

Manzanillo Canoe Club.

The Manzanillo Canoe Club was organized at Cristobal on September 6, with Oliver G. Tubby, president; A. A. J. Kopp, vice-president, and Jeptha W. Dibrell, secretary-treasurer. It is the intention of the club to erect a thoroughly equipped canoe house on Folks River Bay. The membership will be between forty and fifty; active membership to be confined to canoe owners. Owners, or intending owners, of canoes, desiring to become associated with the club, may make application for membership.

Missing Men.

Any one having information regarding the whereabouts of Jules Levy, who is supposed to be residing on the Isthmus of Panama, is requested to communicate with the Director of Posts, Ancon, C. Z.

Any one having information regarding W. M. Palmer, a carpenter by occupation, and who is supposed to have come to the Isthmus of Panama, is requested to communicate with the American Legation Panama.

Building Notes.

One of the first permanent buildings to be erected on the Canal Zone has been authorized for quarters for the caretaker of Brazos Brook Reservoir. It will be constructed of concrete and will have a tile roof, in contrast with the frame buildings with sheet iron roofs which are used as Canal quarters. It will be one story high and will contain a sitting room, dining room, kitchen and pantry, two bed rooms, bath, dry room, a servant's room and bath.

A four room school building for the colored children of Ancon and Corozal will be erected in Ancon from material taken from labor barracks at Tabernilla.

A fifteen-foot addition has been authorized for the Ancon Market.

Obituary.

W. E. Clayton, an employe of the Atlantic Division at Cristobal, died at Colon Hospital on September 27. He was forty-five years of age, a widower, and had been on the Isthmus four years. He is survived by a brother living at Huntington, Ind.

The death of Mrs. Boyd, wife of O. S. Boyd, occurred at their home in Cristobal on Friday, September 20, 1911. She had been on the Isthmus for over six years, and is survived by her husband and two children. Funeral services will be held at Christ Church, Colon, on Thursday morning October 12, immediately after arrival of train No. 2.

United Spanish War Veterans.

The United Spanish War Veterans will give a military ball at the Hotel Tivoli, Ancon, on the evening of November 2, for the benefit of their relief fund.

Atlantic Entrance Breakwater.

A lack of piles, with which to continue the construction of the trestle from which rock is dumped, has caused a partial suspension of work on the breakwater at the Atlantic entrance. Three weeks ago the supply of piles ran out, two weeks ago one of the steam shovels in the quarry suspended work because there was no place to dump the rock it was excavating, and last week the second shovel shut down. It is expected that a shipment of piles will be received this week, in which event, work will be resumed. Of two shipments received from the States recently aggregating 2,960 piles, 1,250 piles have been condemned. The trestle now extends 6,619 feet from the shore line towards the entrance of the Canal, and it is filled with Toro Point rock up to within a few feet of the water surface. This rock disintegrates on exposure to the air and, therefore, the superstructure of the breakwater will be made with hard rock from Porto Bello.

The second of the derrick barges which will handle this rock was launched at Mount Hope marine shops on September 28. Its hoisting apparatus, a Lidgerwood double drum, with 14 by 18 inch cylinders, has arrived from the States, and this, with boilers from an old French clapet and a steam shovel boom engine for the swinging apparatus, will be installed at once. Work at the marine shops is in such condition at present that both the derrick barges can now be completed.

Ladder dredge *No. 1* which has had its hull plates renewed at the Mount Hope marine shop, has rejoined the dredging fleet at the Atlantic entrance and is now working just outside the shore line.

Suction dredge *No. 86*, which underwent extensive repairs at the Mount Hope marine shop after having completed the fill of Colon, has been assigned to work on the hydraulic fill of Gatun dam, taking the place vacated by the *Sandpiper* on the north side of the east section.

A petition that the battleship *Oregon* be assigned first place in the naval pageant, which it is assumed will be a feature of the exercises at the opening of the Canal, has been received on the Isthmus, and has been referred to the Spanish War Veterans for such action as they deem fit to take.

Band Concert

A concert will be given by the Isthmian Canal Commission Band at the Hotel Tivoli, Ancon, C. Z., on Sunday, October 8, 1911, at 7.30 p. m. The program follows:

1. March—*Ideal*........ .... Reeves
2. Selection—*The Pink Lady*.......... ..... Caryl
3. Intermezzo Elegante—*From Tales of Hoffman* Offenbach
4. Overture—*Jolly Robbers*...... .. . Suppe
5. Characteristic Morceau—*On Tiptoe*.. ... Hosmer
6. (*a*) Two-step—*Billy* ...... Kendis
   (*b*) Popular March—*Who Are you With Tonight?* .Van Alstyn
7. Paraphrase—*Rocked in the Cradle of the Deep*. . Lovenberg
8. Medley Selection—*Rossiter's Popular Songs*—Alford
9. March—*Kaiser Friedrich* .. .. Friedman

CHARLES E. JENNINGS, *Musical Director.*

The next concert will be given at Cristobal, C. Z., on October 15, at 4.30 p. m.

Married.

BUCKLEY-HARRISON—On September 6, in Baltimore, Md., Donald Buckley, of Boston, Mass., to Mamie E. Harrison, of Wasbington, D. C., the Rev. Thomas R. Woodford officiating. Canal Zone residence, Culebra.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The schedule of moving picture entertainments for the week of October 9 to 14 follows:

Monday, Empire; Tuesday, Culebra; Wednesday, Corozal; Thursday, Cristobal; Friday, Gorgona; Saturday, Gatun.

The standing of the Isthmian Bowling League teams on Saturday, September 30, was as follows:

	Won.	Lost	P.C.
Empire..................	22	8	.733
Cristobal................	18	12	.600
Gatun....................	18	12	.600
Gorgona..................	16	14	.533
Marines........	13	17	.433
Culebra..................	4	26	.133

COROZAL.

On Tuesday night, September 28, J. L. Malone played pool and billiard games, and gave an exhibition. In the billiard game he defeated Messrs. Farmer, Thompson and Cunningham, 100 to 54. In the pool game he defeated Messrs. Wilson and Baker, 75 to 36.

On Friday the McClintic-Marshall basketball team from Pedro Miguel played a practice game with the Corozal team. Saturday night the Corozal team will meet the Gorgona team at Corozal in the first of the league games.

Twenty-four new books have been ordered for the library.

The improvements authorized for the Corozal clubhouse include an extension in which will be located a pair of bowling alleys, a well equipped locker room with adjoining shower baths, and a barber shop.

CULEBRA.

The volley ball game between the "All Stars" and "Married Men" on Tuesday evening was won by the married men. The game between the Quartermaster's Department and Assistant Engineers on Thursday evening was won by the latter.

The handicap bowling tournament closed on Friday evening. Following are the names of the men that finished, and their standings:

Name	Won	Lost
Baumer	17	2
Bronson	14	4
Smith	14	4
Sjoblum	14	5
Mitchell	14	5
Leylander	13	6
Sickler	13	6
Fox	10	9
Driscoll	11	8
Huttelmaier	6	16
Warner	5	14
Mengal	5	14
Fay	4	15
Herrington	4	15

High Score: Driscoll, 247; Mengel, 213; Case, 205.

Duckpin score; over 100: Mitchell, 102; Fox, 106, 109: Hobart, 102, 103.

The Gatun bowling team took three games from Culebra, at Culebra Saturday evening. The scores follow:

Culebra.				Gatun.			
Mengel.	157	179	138	O'Meara.	153	163	179
Sjoblum.	146	104		Cham'l'n	180	180	180
Stilwell.	142	110	132	Beattie..	159	153	148
Case.....	167	181	180	Galloway.	201	154	142
Dougherty.	162	156	210	Barte..	148	166	190
Fay.....			135				
Total..	774	730	795		841	816	839

EMPIRE.

The following high scores were bowled on the alleys during the past week: Tenpins—Pinney 202, 204, 208 213, 201, 204, 257; Parkis 233, 257; Anderson, 202; Giavolli, 201. Duckpins—Coombs, 107, 105; Pulsifer, 110; Grund, 104; Payne, 115.

The league games bowled on Empire alleys on Saturday night, September 30, resulted in Empire's winning three games. Scores were as follows:

Empire.				Gorgona.			
Pinney. ..	162	183	168	Otis	178	156	164
Giavolli ..	148	193	194	Sims...	163	135	177
Anderson	138	170	157	Arnold	139	120	180
Davis....	179	178	177	Orr	156	143	156
Parkis.	188	172	180	Hald'm'n	172	142	155
Total	815	896	876		808	696	832

On Saturday night, October 7, the Gatun team will bowl on the Empire alleys in the league series.

The Isthmian Basket Ball League will begin the season on Saturday, October 7, when the Empire team will play Culebra, on the latter's court.

The regular meeting of the Empire Literary and Debating Society will be held on Friday evening, October 6.

On Sunday evening, October 8, there will be an informal song service at 8.30 o'clock.

GORGONA.

Mr. Malone, a pool and billiard expert, gave an exhibition on Wednesday night, September 27. In pool he defeated two local players by a score of 140 to 42. In billiards he defeated Geo. Strong by a score of 150 to 26 and Thos. Ryan, 125 to 21.

At the meeting of the basketball players on Wednesday night, September 27, Jerry Carpenter was elected captain and Geo. Auer, manager.

In the bowling contest on Gorgona alleys Saturday night, Empire took two out of three games from the local team. Following are the scores:

Empire.				Gorgona..			
Gustavson	168	191	147	Roper....	148	133	143
Spink....	148	157	143	W. Var'c'p	159	162	176
Gorham...	145	157	178	R. Var'c'p	145	103	113
Pierson....	135	167	155	Sexton...	161	149	171
Huson....	136	146	164	Haggerty.	137	132	147
Total.	732	818	787		750	679	755

GATUN.

In the return match game of pool between Malone, a professional from the States, and DePoorter, of Gatun, the latter was defeated.

On Saturday evening, September 30, a game of basket ball was played at Gatun between two teams of the McClintic-Marshall Company. The score resulted, Atlantics, 25; Pacifics, 6. The line up: Atlantics—Wilson, R. F.; Hortenstine, L. F.; Minotti, C.; Conley, R. G.; Gibson, L. G.; Pacifics—Cooper, R. F.; Ramsey, L. F.; Hutzley, C.; Vannerman, R. G.; Maguire, L. G. Goals from field: Wilson, 1; Hortenstine, 5; Minotti, 3, Conley, 2; Cooper, 1. Fouls: Minotti, 3; Cooper, 4.

On Saturday night, October 7, Gatun will play Cristobal in the first basketball game of the season.

An order for 110 new books was sent to the States on Tuesday, October 3rd. These books comprise late fiction and some books of a technical character.

Gatun took all six games of bowling on Saturday, September 30. The score on the home alleys was:

	1st game.	2d game.	3rd game.
Gatun....	787	793	776
Culebra..	754	682	676

A large quantity of gymnasium supplies and 100 new Gatun pennants have arrived from the States and are now on sale. Ten mineralite duckpin bowling balls were also received.

CRISTOBAL.

Fifty-seven men attended the debate at the meeting of the Literary and Debating Club on Wednesday evening, the subject under discussion being "Resolved, That the Initiative, Referendum and Recall are best for the government of our States." Decision was in favor of the affirmative, after which there was a public discussion.

At the presentation smoker held on Thursday night, September 28, there was an attendance of 324. A program was rendered and the presentation of medals to winners of the Isthmian Duck Pin League by C. M. Bullard followed.

The subject to be discussed before the Debating Club on Wednesday evening, October 11, will be "Resolved, That the present freedom of the press should be restricted."

The Culebra bowling team will play the Cristobal team on the home alleys on Saturday evening, October 7.

Following is the score of games between bowling the Marines from Camp Elliott and Cristobal, at Cristobal on Saturday evening, September 30:

Marines.				Cristobal.			
Martins...	118	132	160	Gibson....	155	162	158
Dowel.	124	162	158	Blackburn.	160	169	200
Tryan....	135	129	154	Rabbitt...	165	205	144
Cataldo.	118	125	152	Bullard...	175	171	192
Clouse.	137	160	178	Louch.....	175	181	181
Total	632	708	802		830	888	875

Misdirected Letters.

ANCON, C. Z., October 4, 1911.

The following insufficiently addressed letters, originating in the United States and its possessions, have been received in the office of the Director of Posts, and may be secured upon request of the addressee:

Bowie, William H.
Bryan, Joseph
Carnes, J. E.
Clinton, G. P.
Cows, William

LOST—On passenger train arriving at Panama at 9 a. m., September 24, a small atlas, and draftsman's ruling pen. Finder will please leave with baggage agent in the railroad station at Panama.

OFFICIAL CIRCULARS.

Reduction of Force

CULEBRA, C. Z., September 25, 1911.

HEADS OF DEPARTMENTS AND DIVISIONS:

European laborers are being discharged on account of reduction of force in the Central Division, and the Acting Chief Quartermaster advises that it is impossible to place these men in other Departments or Division In fact, at the present time there appears to be a surplus of both European and West Indian labor. Some few of the older Spaniards of doubtful efficiency have been furnished transportation to return to Spain, and it may prove necessary to resort to wholesale repatriations. In order that the present situation may be be handled more intelligently, it is requested that you will advise whether the conditions of your work will require within the next several months either an increase or reduction in the number of European laborers employed, and what will be the probable extent of the increase or reduction.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Acting Depot Quartermaster

CULEBRA, C. Z., September 27, 1911.

MR. C. L. PARKER,
Assistant Depot Quartermaster,
Mount Hope, Canal Zone.

Sir:

Effective September 28, 1911, and during the absence of Captain Courtland Nixon, on leave, you will act as Depot Quartermaster.

You are authorized to receive and receipt for supplies of the Isthmian Canal Commission consigned to Colonel C. A. Devol, or the Chief Quartermaster, Isthmian Canal Commission; to accomplish bills of lading; to certify invoices for payment as to quantity and quality of supplies shown on such invoices; and in general to perform such duties as properly belong to the position of Depot Quartermaster.

Respectfully,
R. E. WOOD,
Acting Chief Quartermaster.

Acting as Purchasing Agent

CULEBRA, C. Z., September 28, 1911.

CIRCULAR No. 413:

Effective September 28, 1911, and during the absence on leave of Captain Courtland Nixon, Mr. Charles L. Parker, Assistant Depot Quartermaster, will perform the duties of Purchasing Agent on the Isthmus.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning October 21.

The Commissary Bulletin for October contains notices of new supplies received, reduction in prices on shirts, shoes, and raincoats, and a price list of groceries and tobaccos.

The only material changes in the cold storage price list as published in last week's CANAL RECORD are:

Increased—fresh eggs, from 29 to 30 cents a dozen, from 15 to 16 cents a half dozen; ham, 26 to 28 cents a pound; lettuce, 12 to 15 cents a pound; romaine, 12 to 15 cents a pound; tomatoes, 4 to 6 cents a pound; peaches, 6 to 8, grapes, 7 to 8, and plums 7 to 10 cents a pound. Decreased—Cauliflower, 12 to 10 cents a pound. New apples, 7 cents per pound.

Sale of Horizontal Stationary Gasoline Engine

Sealed bids will be received at the office of the Depot Quartermaster, Mount Hope, until two o'clock P. M., October 16, 1911, when they will be opened in the presence of attending bidders, for one 2½ horse power "Williamsport Special" horizontal stationary gasoline engine, complete with battery box, cooling tank and driving belt. Engine can be seen and examined on any working day between the hours of seven to eleven A. M., and one to five P. M., upon application to this office. The right is reserved to reject any or all bids. Bids must be plainly marked "Proposal to purchase one stationary gasoline engine, to be opened October 16, 1911." and addressed to the Acting Depot Quartermaster, Mount Hope, C. Z.

CHARLES L. PARKER,
Acting Depot Quartermaster.

Supplies for the Canal

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon and Balboa during the week ending September 30:

Colon, September 24, from New York, with 13 cases machinery, 10 cases copper tubes, for Atlantic Division; 1,485 pieces pig iron for Mechanical Division; 10 barrels paint, 158 drums oil, 100 cases linseed oil, 100 cases liquid exterminator, 53 pieces black iron pipe, 40 coils rope, 50 pieces steel angles, 40 cases stovepipe, for stock; and a miscellaneous cargo, the whole consisting of 2,132 packages, weighing 180 tons.

Magdalena, September 24, from New York, with 6 pieces rock skips for Atlantic Division;

Ballachmyle, September 24, from New York, with 107,300 bags cement for Atlantic and Pacific Divisions; 6 cases benzine for stock.

Lewis Luckenbach, September 24, from New York, with 41 crates castings for Atlantic Division.

San Mateo, September 25, from New Orleans, with 200 drums gasoline and 6,411 pieces yellow pine lumber for stock.

Navajo, September 26, from San Francisco, with 1,340 bales alfalfa hay for stock.

Turrialba, September 28, from New Orleans, with 12 crates concrete mixers for Pacific Division; 425 pieces white oak lumber, 8,822 pieces yellow pine lumber for Mechanical Division; 45 pieces white oak lumber, 13,894 pieces yellow pine lumber, 24 pieces piling, 75 bales Sucrene feed, 75 bags cotton seed meal, 357 bales rice straw, 6 cases paint, for stock.

Almirante, September 28, from New York, with 250 cases toilet paper, 100 kegs bolts, 36 pieces steel, 76 kegs track bolts, for stock.

Rainfall from September 1 to 30, 1911, Inclusive.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Joachim* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct, leave on Thursdays at 3 p. m.; ships for New Orleans in the coastwise service on Thursdays at 4 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

Auction Sale of Calves.

On Saturday, October 7, 1911, at 10 a. m., there will be sold at public sale to the highest bidder at the Ancon Hospital dairy, three or four calves, about one month old. The dairy is located near the insane asylum in the rear of the hospital grounds. The terms of the sale will be cash.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, OCTOBER 11, 1911. No. 7.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Test of Lock Gates.

The work of erecting the four leaves of the upper guard gates at Gatun has so far advanced that practically all the structural material is in place and the rivetting and calking are now in progress. The bridges which span the lock chambers, from which structural material is lowered for the construction of the gate leaves, have been moved over the site of the upper operating gates, and the erecting of material will advance on those gates while the rivetting and calking are being completed on the guard gates. The leaves of the guard gates are 54 feet 8 inches high, and those of the upper operating gates, 77 feet.

Under the contract fifty per cent of the price of the gates is paid when the material is accepted by the Commission's agent in the States, and 45 per cent after the gates have been erected, and have stood the tests prescribed. It is probable therefore that the tests on the guard gates will be made by the contractor as soon as the gates are ready. Most important of these is that for watertightness of the gate leaves. The leaves are so constructed that the lower half will be an air chamber perfectly water tight, giving so much buoyancy, with the lock half full of water, that about three-fourths of the weight of the gates will be taken up by the water, and approximately only one-fourth will be borne by the pintle at bottom of leaf and pin at top of leaf which is held by a heavy yoke securely anchored in the lock walls. In order to overcome the effect of the buoyancy when the lock is full of water, which would have a tendency to lift the leaves out of their sockets, the upper half of the gate will fill with water. To this end the downstream face of each leaf will be calked water tight, but holes will be left in the upper half of the upstream face, so that, as the water rises, the upper half will fill and act as a weight. In making the test for the watertightness of the air chamber, it is proposed to fill the chamber with water and then to remedy any defects in the calking that may become apparent from the test.

South Guide Wall of Gatun Locks.

The laying of concrete in the cellular portion of the upper guide wall at Gatun Locks was begun on September 30. The entire wall extends into the lake 1,500 feet from the upper guard gates, and the south or outermost 850 feet of it are founded on light earth, bed rock being about 150 feet below the surface. On account of the character of this foundation the southern portion is being constructed upon piles, driven from 35 to 70 feet into the ground, and to make the weight upon them as light as possible the wall is being made a reinforced concrete cellular structure.

The wall will be founded on a concrete slab from 4 to 5 feet thick laid over the tops of the piles, and will be 58 feet wide and 67 feet high above the ground, which is at 32 feet above sea level, the top therefore being at 14 feet above the normal level of the lake. The outside shell will be a reinforced concrete wall two feet thick, and within this there will be two 18-inch walls running lengthwise of the guide wall and 17 feet apart, and 50 walls 18 inches thick running the width of the guide wall at regular intervals of 15 feet. Thus the interior will consist of a series of cells 15 by 17 feet in dimension separated by 18-inch partitions.

It is estimated that 35,000 cubic yards of concrete will be placed in the cellular part of the wall, and it is necessary to expedite the construction so that it may be completed to a height of 23 feet, elevation 55 feet, before April, 1912, when the surface of Gatun Lake will begin to rise, reaching 55 feet above sea level about August, 1912. The chief obstacle to rapid progress is placing the forms, as a thousand yards of concrete a day could be supplied if a place were available to put it in place. Both the construction and auxiliary mixing plants will be used in supplying the concrete. A trestle 850 feet long has been run from the west side of the locks alongside the site of the guide wall, and cars from the construction plant will deliver concrete on the west side of the wall to be placed by locomotive crane. On the east side concrete will be delivered from the auxiliary plant and placed by locomotive crane.

Canal Work in September.

The grand total of Canal excavation to October 1 was 150,723,962 cubic yards, leaving to be excavated 44,599,417 cubic yards, or less than one-fourth of the entire amount for the completed Canal.

The total for September was 2,538,764 cubic yards, as compared with 2,687,088 cubic yards in September, 1910, and 2,836,385 cubic yards in September, 1909. Practically all the excavation was "work excavation," there being only 7,561 cubic yards of "plant excavation."

The dry excavation amounted to 1,566,102 cubic yards, and was principally by steam shovels. The dredges removed 892,373 cubic yards, and 80,289 cubic yards were sluiced, in addition to the amount pumped into Gatun Dam by suction dredges. The progress on the locks at Gatun, Pedro Miguel, and Miraflores is referred to elsewhere in this issue.

In the Atlantic Division, the total excavation was 498,410 cubic yards. Of this total, 77,976 cubic yards were dry excavation, and the remainder was removed by the dredges in the Atlantic entrance.

The total excavation in the Central Division was 1,361,445 cubic yards, all of which was from the prism. The amount taken from Culebra Cut was 1,340,173 cubic yards, the greatest excavation for any September in the history of the Cut.

In the Pacific Division, the total excavation was 678,909 cubic yards, 471, 939 cubic yards of which were taken out by the dredges at the Pacific entrance, and 70,289 by the hydraulic excavation plant working immediately below Miraflores Locks.

A detailed statement of the excavation, and a summary of the work on the locks and dams, follow:

ATLANTIC DIVISION.

NOTES OF PROGRESS.

(*Continued.*)

Mean rainfall along Canal (eleven stations), 6.35 inches.

By "Work" excavation is meant excavation actually made for one of the constituent parts of the Canal, such as prism, diversions, or locks, etc.; that is, it represents material taken from the area to be occupied by the Canal and constitutes excavation useful for the completed Canal.

By "Plant" excavation is meant excavation outside of any of the constituent parts of the Canal, such as prism, diversions, or locks, etc. It includes material necessary to be excavated for construction purposes only, and is chargeable against the particular plant item for which it is performed, such as prism, diversions, locks, etc.

DAM AND LOCK CONSTRUCTION.

MATERIAL.	Atlantic.	Pacific.	Total.
	Cu. Yds.	*Cu. Yds.*	*Cu. Yds.*
Concrete laid in locks.	57,298	71,462	128,760

October 7........................	7.35	2,835
Total........................	44.40	16,604

Track Layout in South End of Culebra Cut.

A long trestle is under construction in the south end of Culebra Cut for the purpose of making a cross-over to the bottom of the incline up which trains may move from all parts of the south end to the tracks leading to the dumps. This will make it possible to construct a new incline on the east side, and to complete the excavation on the east side of the Cut from Paraiso bridge to Cucaracha. When the excavation has advanced to the proper point, a retaining wall will be constructed across the front of Paraiso slide. When this wall is brought up to the proper height a permanent incline with double tracks will be constructed outside the prism, and this will be used by all trains until the excavation in the south end of the Cut is completed.

The tug *Cocoli* has received a general overhauling, having had two new feed pumps installed, its high-pressure cylinder bored out, a new piston fitted, its boiler renovated, and its bunkers scaled and painted.

CONCRETE WORK IN THE LOCKS.

Over 67 per cent of the concrete for the locks is in place, the amount at the close of work on October 7, being 2,827,235 cubic yards, out of a total of approximately 4,199,400. A total of 31,064½ cubic yards of concrete was laid in the locks during the week ending October 7.

GATUN LOCKS.

Over 81.5 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on October 7, being 1,635,164 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending October 7, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone.	Total.

STEAM SHOVEL RECORDS.

Work in Culebra Cut and on P. R. R. Relocation.

During the month of September the total amount of material excavated in the Central Division was 1,361,445 cubic yards, of which 274,914 cubic yards were classified as earth, and 1,086,531 cubic yards as rock. Of this quantity 1,339,437 cubic yards were removed by steam shovels, 736 cubic yards by bucket cranes, contractors removed 10,000 cubic yards by sluicing, and 11,272 cubic yards by hand.

The high record for the month was made by shovel No. 207, working 13 days in the Culebra District and 12 days in the Empire District, which excavated 47,424 cubic yards of rock. The second best record for the month was made by shovel No. 231, working 25 days in the Culebra District, which excavated 46,608 cubic yards of rock.

The best record for a shovel of the seventy-ton class was made by shovel No. 109, working 24 days in the Culebra District, which excavated 36,352 cubic yards of rock and earth.

Shovel No. 254, working in the Culebra District, made a high record for one day by excavating 3,268 cubic yards of rock on September 14.

Except where noted, monthly reports are computed by place measurement, while the daily reports are based on car measurement. The best records for the month and for one day are shown below:

BEST RECORDS FOR THE MONTH.

EMPIRE DISTRICT.

Shovel No.	Cubic Yards.			
	Earth.	Rock.	Total.	No. of days at work.
229		37,488	37,488	25
227		32,205	32,205	25
215	5,864	24,998	30,862	25

CULEBRA DISTRICT.

Shovel No.	Earth.	Rock.	Total.	No. of days at work.
230		44,595	44,595	25
231		46,608	46,608	25
254		46,095	46,095	23

PEDRO MIGUEL.

Shovel No.	Earth.	Rock.	Total.	No. of days at work.
122	25,102		25,102	25

BEST RECORDS FOR ONE DAY.

Shovel.	Location.	Date.	Character of material excavated.	Cubic yards.
258	Empire	Sept. 22	Rock	3,008
232	Empire	Sept. 28	Rock	2,635
232	Empire	Sept. 18	Rock	2,377
254	Culebra	Sept. 14	Rock	3,268
230	Culebra	Sept. 25	Rock	3,141
256	Culebra	Sept. 27	Rock	2,972
122	Pedro Miguel	Sept. 14	Earth	1,520

Relocated Line of Panama Railroad.

The total steam shovel excavation on the relocated line of the Panama railroad amounted to 343,770 cubic yards in September.

The best month's record was made by steam shovel No. 262, working on the Monte Lirio section, which excavated 10,000 cubic yards of earth and 49,500 cubic yards of solid rock, a total of 59,500 cubic yards.

In the 70-ton class, the best month's record was made by steam shovel No. 128, working on the Monte Lirio section, which excavated 37,050 cubic yards of earth.

The best day's record for shovels with 5-yard dippers was made by steam shovel No. 262, working on the Monte Lirio section, which excavated 4,100 cubic yards of rock on September 21.

The best day's record for 70-ton shovels was made by steam shovel No. 128, working on the Gatun section, which excavated 1,900 cubic yards of earth on September 14.

Month's records are by place measurement, and day records are by car measurement. All material was loaded in 10-yard dump cars.

BEST RECORDS FOR THE MONTH.

Shovel No.	Location.	Cubic Yards by Cross Section.			
		Days worked.	Earth	Rock.	Total.
262	M. Lirio	25	10,000	49,500	59,500
263	Gatun	18		51,350	51,350
128	M. Lirio	24	37,050		37,050
266	Paraiso	24	18,300	18,300	36,600
123	Empire	25	34,235	2,000	36,235

BEST RECORDS FOR ONE DAY.

Shovel.	Location.	Date.	Character of material excavated.	Cubic yards.
262	Monte Lirio	Sept. 21	Rock	4,100
263	Gatun	Sept. 13	Rock	3,440
257	Gatun	Sept. 8	Rock	3,410
266	Paraiso	Sept. 16	Earth and rock	2,400
128	Gatun	Sept. 14	Earth	1,900
117	Gatun	Sept. 7	Rock	1,860

Total steam shovel output during the month of September, 343,770 cubic yards.

Total number of steam shovel working days, 237.

Average output per working day, 1,451 cubic yards.

Work of the Dredge "Marmot."

The French ladder dredge *Marmot*, which has been working in the Pacific entrance to the canal, has been placed on the gridiron at Balboa shops for minor repairs. This is the first time the *Marmot* has been on the gridiron since being placed in commission, in May, 1909. During that period the dredge has excavated 3,309,459 cubic yards of earth and rock. The highest record for one month, made in December, 1910, was 219,795 cubic yards. When the *Marmot* returns to commission it will be operated on single shift, working only from mean to low tide and from low to mean, as the excavation has so far advanced that it is impossible for the dredge to reach bottom at high tide. By the end of October all four of the dredges operating in the Pacific channel will be on single shift.

Excavation at San Pablo and Tabernilla.

When the steam shovels were working in the lake region at San Pablo and Tabernilla they could not complete the excavation because the canal channel runs across the line of the Panama railroad in two places. When the present line of the railroad is cut in February and trains are running over the relocation, these two pieces of excavation can be completed, and the Central Division is now preparing for this work. Drills will begin work this week so that sufficient material may be blasted and broken up before the shovels begin to dig. It is expected that a shovel will begin operating at San Pablo about the first of December, and that another will begin on January 1, and two others about February 15, making four shovels in all on this job. The work will be finished about the end of April. Until after the trains begin to run over the relocated line the old dumps at San Pablo will be used for disposal of the material excavated, and after that it will be dumped into the river. River dumping is the more economical, but it is not thought safe to obstruct the channel until after the new line of the railroad is in use and the river assumes its dry season flow. About 258,000 cubic yards of rock and earth must be dug out at San Pablo.

At Tabernilla the material to be removed is a part of the right of way of the railroad, and work there cannot begin until after the relocated line is opened. One shovel will do this job, which amounts to about 13,000 cubic yards.

Snubbing Posts

A requisition has been made on the Washington office for 585 snubbing posts at which ships may tie up in the locks or approaches. These posts are to be a 1¼-inch shell casting anchored 6 feet in the masonry by a 1¼-inch bolt. After they are anchored they will be filled with concrete. There are two types, one of which will project 36 inches above the masonry of the lock walls; and the other to project 14 inches. On the approach walls they will be from 50 to 60 feet apart and on the lock walls will be staggered every 100 feet. The large posts will be 26 inches in diameter at the base and the small ones 22 inches.

Work of Unloaders in Central Division.

The following statement shows the number of Lidgerwood cars unloaded by the Central Division during the month of September, 1911:

Location.	No. of unloaders.	No. of trains.	No. of cars.
Balboa	3	1,019	20,380
Miraflores	3	762	15,240
Gamboa	4	1,049	22,049
Total	10	2,830	57,669

Pacific Division Sand Service.

A report of sand cars loaded and shipped from Balboa during the month of September, follows:

Destination.	Number Cars.	Cubic Yards.
Pacific Division	2,429	38,099
Central Division	33	495
Atlantic Division	16	378
Mechanical Division	4	100
Quartermaster's Department	7	175
Panama railroad	6	150
Miscellaneous	37	600
Total	2,532	39,997

Work on the Dumps.

Material from the Culebra Section of the Central Division was disposed of on the dumps at Miraflores and Balboa during the months of September, 1910, and September, 1911, as follows:

Disposition and Mode.	1911	1910
Balboa and vicinity, Lidgerwood trains	1020	998
Balboa and vicinity, Western Dump trains	99	68
Miraflores and vicinity, Lidgerwood trains	769	750
Miraflores and vicinity, Western dump trains	3	8
Total Lidgerwood trains	1,789	1,748
Total, Western dump trains	102	76
Total yardage, cubic yards	712,820	672,170

It will be seen that an average of 75 trains of material per day, aggregating 28,512.8 cubic yards per day, were disposed of on the Miraflores and Balboa dumps.

The New United Methodist Church at Pedro Miguel will be dedicated on October 22.

RECORD OF CANAL WORK SINCE AMERICAN OCCUPATION.

MONTHLY TOTALS BY CUBIC YARDS OF EXCAVATION AND LOCK AND DAM CONSTRUCTION.

[All figures are of work useful for the completed Canal.]

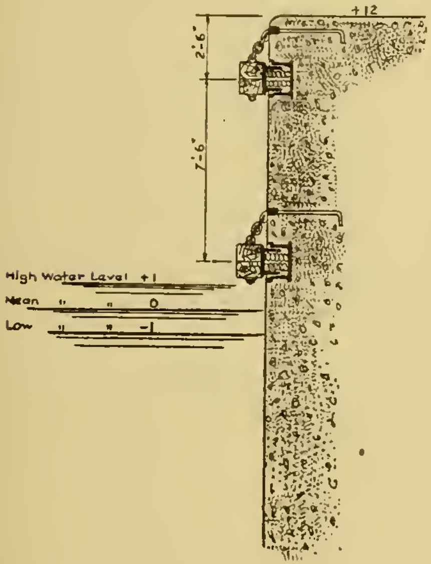
FENDERS FOR LOCK APPROACH WALLS.

Method of Distributing Force of Blow Caused by Ships Bumping Walls.

Ships passing through the locks will approach under their own steam, and will anchor until the towing locomotives can take them in tow for passage through the locks. The approach is formed between a section of the center wall, extending into the canal from 1,445 to 1,700 feet from the first gate, and flare or wing walls, which are a continuation of the side walls. These walls will be fitted with wooden fenders composed of 12 by 16 inch stringers running longitudinally along the sides, bearing every 5 feet against a casting supported by a nest of four springs. The sketches printed herewith show the location of the fenders on the walls, and the method of suspending them so that they will bear upon the springs. The purpose of the fenders is to take the stress caused by a ship bumping against the walls.



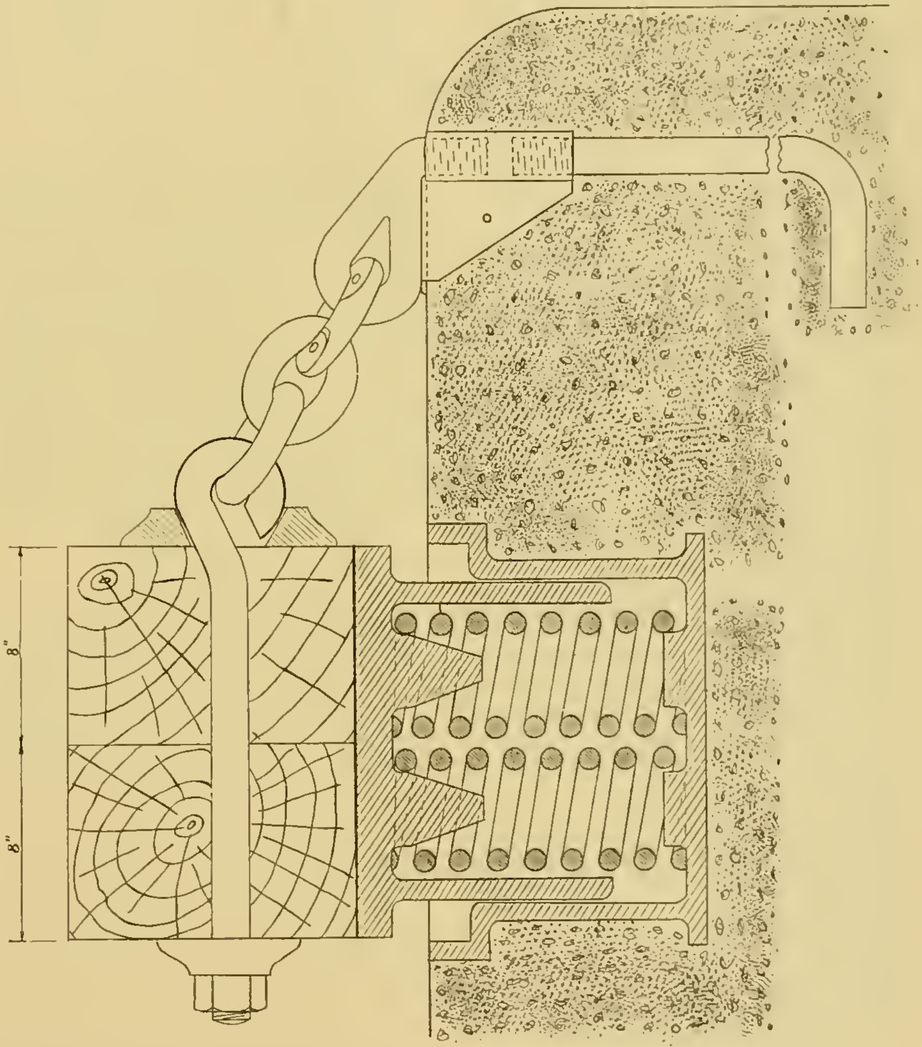
SECTION OF LOCK WALL SHOWING PARALLEL LINES OF BUFFERS.

A requisition has been made on the Washington office, and bids will presently be requested, for the following materials to be used in the fenders: 2,172 timber bolts, 1½ inches in diameter, with nut, 32,580 pounds; 2,172 two link chains for hangers, 21,720 pounds; 2,200 special links for hangers, 11,000 pounds; 762 bronze sleeves for hangers, 3,505 pounds; 762 eyes for hangers, 6,858 pounds; 762 anchor rods for hangers, 13,716 pounds; 25,608 helical springs, 640,200 pounds; 2,168 washers (top), 34,688 pounds; 2,168 washers (standard), 13,008 pounds.

In addition to these materials there will be required the following: 6,394 buffer castings, 1,381,104 pounds; 6,394 movable buffer castings, 1,278,800 pounds; 2,168 bearing blocks, 28,624 pounds; 51,152 bolts, 89,516 pounds; 12,788 plates, 60,104 pounds; 31,659 feet of buffers. The castings and bearing blocks will be made at Gorgona foundry.

The cups in which the springs are nested are anchored into the concrete of the walls by means of a flange on the top and bottom. These castings are 17¾ inches long, 14¾ inches wide, and 11½ inches deep, and weigh 216 pounds each. The movable buffer casting, which acts as a cap for the springs, is 16 inches long, 12⅝ inches wide and 10⅝ inches deep. The springs are to be made of carbon or chrome vanadium spring steel, will be 12¼ inches long when free, 9¼ inches when loaded, 3-1/16 inches inside, and 4 inches outside diameter, and must be capable of being compressed not less than 3 nor more than 3½ inches under a load of 7,500 pounds.

The stringers will hang by 3 links from eyes on the ends of steel anchor bolts, 1½ inches in diameter, embedded in the concrete 2 feet 5½ inches. Thus, free movement will be procured. The nests of springs will be spaced along the walls at 5-foot intervals, and the hangers for the wooden fenders will be at intervals of 15 feet. Each hanger bolt will splice two stringers so that each row of fenders will be a continuous line of stringers. The shortest of these will be on the upper approach wall at Gatun, 970 feet, and the longest on the lower approach wall at Gatun, 1,202 feet. There will be in all the locks 48 rows of buffers—double rows on each side of six middle approach walls, and on ten of the side or wing walls, and one row on the side wing walls at the upper end of Miraflores and Pedro Miguel locks.



SECTION THROUGH NEST OF SPRINGS, SHOWING CUPS IN WHICH SPRINGS ARE HELD, AND ALSO METHOD OF HANGING BUFFERS UPON THE WALL.

Docks at Pacific Entrance.

Work on the new concrete dock at Balboa, which is to be part of the permanent harbor improvements, has so far advanced that 30 of the 50 concrete caissons have been sunk to rock; 47 of the caissons are under way, leaving only 3 to set. Eighteen have been filled with concrete and on them the lower tie girders are now being placed. The average depth of the caissons is about 60 feet below mean tide level, the maximum being 62 feet and the minimum 58.

Great difficulty has been experienced at times in forcing the caissons down through the argillaceous earth. Laborers within the concrete cylinder remove the earth beneath it, sending it up in buckets hoisted by a donkey engine; but the lateral pressure from the outside prevented, in one case, the passage of the cylinder, even under a pressure of 40 tons in addition to its own weight. The earth was loosened by a system of high-pressure jets of water forced down the outside of the cylinder.

It is expected that work on the superstructure of the dock will begin not later than the first of November. So far, though such work is notably hazardous, only one man has been killed. He was a silver employe who, in attempting at night to cross one of the pits in a manner unauthorized, fell to the bottom.

The highway at Pedro Miguel, along the foot of the embankment upon which the relocated line of the Panama railroad runs, will be closed for about a month while rock is being dumped along the face of the embankment to make a toe that will prevent further sliding.

EXECUTIVE ORDER.

Associate Justice of the Supreme Court.

Under authority vested in me by law, and until otherwise provided by law or ordered, William H. Jackson is appointed an Associate Justice of the Supreme Court of the Canal Zone at a salary of six thousand dollars per annum, effective the day he enters on the duties of the office.

WM. H. TAFT.

THE WHITE HOUSE,
September 21, 1911.
[No. 1413.]

Attendance at Canal Zone Schools

The Canal Zone schools opened for the session of 1911-1912 on October 2. The total enrollment of white children for the first week was 1,004, which is only 18 less than the total net white enrollment for the entire session of 1910-1911.

Six hundred and fifty-four colored and native children were enrolled. This does not include two new schools, which will open at Ancon and Mandingo within the next few weeks, with an attendance, respectively, of about 130 and 30. In addition to these, new schools for colored and native children were opened at Miraflores, Cucaracha and Marajahl. A new school building was up at Mount Hope during the vacation period. The total enrollment in this division during the opening week last year was about 600.

Inasmuch as the attendance during the first weeks is, as a rule, noticeably less than for the remainder of the session, the total enrollment of 1,658 for the first week indicates that the attendance this session will be the largest yet attained by the schools of the Zone. The children are instructed by 43 white and 25 colored teachers.

A list of the schools, with the enrollment for the first week at each place of white, colored and native children, follows:

LOCATION.	White.	Colored.
Ancon	169	Not open yet.
Miraflores		22
Pedro Miguel	63	28
Paraiso	22	50
Cucaracha		22
Culebra	55	121
Empire	184	97
Las Cascadas	31	Not open yet.
Bas Obispo	23	
Cruces		20
Matachin		31
Gorgona	131	40
Gatun	162	52
Mount Hope		23
Marajahl		34
Cristobal	164	114
Total	1,004	654

All steerage passengers brought from or embarking at ports where cholera prevails, especially those from Marseilles and Genoa, are held in quarantine upon arrival in Colon a sufficient length of time to determine by bacteriological examination whether they are carriers of the cholera bacillus.

Society of the Chagres.

The first general meeting of the Society of the Chagres, held at the Strangers' Club Colon, Saturday the 7th instant, was attended by more than one hundred members. The constitution was ratified with certain minor amendments, and the following officers were elected to serve until the annual meeting in January: Col. W. C. Gorgas, President; Dr. Lloyd Noland, Vice President; Mr. C. A. McIlvaine, Secretary-Treasurer; Capt. R. E. Wood, Mr. John Burke, Mr. John J. Meehan and Mr. John K. Baxter, members of the executive committee. A sample pin manufactured by Tiffany was exhibited at the meeting. The pin engraved with a member's name and the date of his arrival on the Isthmus will cost $3.00. An order will be placed at once for pins for the 207 charter members of the Society now enrolled.

PERSONAL.

Major Chester Harding, with his wife and daughter, is returning from his annual vacation leave in the States on the *Cristobal*, which is due to arrive on October 12

Dr. J. C. Perry sailed on the *Mexico* for Chile on October 9, to attend the International Sanitation Conference to be held at Santiago.

Cranes at Balboa Docks.

The first of the eight 4-ton electric cargo-handling cranes for the "steel pier" at Balboa, contract for which was awarded the Maine Electric Company early in July, is expected to arrive at the port shortly. The first two to arrive will be placed at the southern end of the pier, immediately north of the derrick used for heavy cargo. Preparation for the new and heavier cranes has been made by reenforcing the girders at the southern end and laying a concrete floor, 12 inches thick, in which are embedded steel rails for the crane runway. The four-foot sill on the outer side of the pier, which forms the runway for the present 1½-ton cranes, has been removed at this point. This levelling will expedite the work of loading and unloading, especially at low tide.

Rodmen and Levelmen.

An examination to test the fitness of rodmen and levelmen for promotion will be held at Culebra on Sunday, October 29. Employes wishing to enter this examination should forward their applications through the head of the department or division in which they are serving to Mr. A. B. Nichols, chairman of the examining board, Culebra.

Copies of the Annual Report.

Employes of the Isthmian Canal Commission or Panama Railroad Company desiring copies of the Annual Report of the Commission for the fiscal year 1910-1911 should secure application blanks from the head of their department or division.

Masonic

The Masonic Club of Empire will entertain the Gorgona and Las Cascadas Masonic clubs at its next meeting, Wednesday evening, October 18. Special train service will be provided to leave Gorgona for Empire at 7 o'clock and returning will leave Empire at 11.30 o'clock.

I. B. of S. S. and D. M.

Local No. 19, International Brotherhood of Steam Shovel and Dredge Men, will hold its regular monthly meeting on Sunday, October 15, at the Empire lodge hall at 12.15 p. m.

Balboa Lodge No. 4, Knights of Pythias of Las Cascadas, will exemplify the rank of Knight on four candidates on Monday evening, October 16, 1911. All Pythians in good standing are invited to attend.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The standing of bowling teams in the league series on October 7, was as follows:

Team.	Played.	Won.	Lost.	P. C.
Empire	36	27	9	.750
Cristobal	36	23	13	.638
Gatun	36	19	17	.528
Gorgona	36	19	17	.528
Marines	36	16	20	.444
Culebra	36	4	32	.111

The moving picture schedule for the week October 16 to 21 is as follows: Cristobal, Monday; Gorgona, Tuesday; Gatun, Wednesday; Empire, Thursday; Culebra, Friday; Corozal, Saturday.

The standing of temas in the Isthmian Basket Ball League on October 7, was as follows:

Team.	Won.	Lost.	P. C.
Cristobal	1	0	1.000
Gorgona	1	0	1.000
Culebra	1	0	1.000
Gatun	0	1	.000
Empire	0	1	.000
Corozal	0	1	.000

The results of the games on October 7, were:

Cristobal 23; Gatun 12, at Gatun.
Culebra 24; Empire 8, at Culebra.
Gorgona 30; Corozal 10, at Corozal.

The games to be played on October 14, are:

Cristobal at Empire.
Gatun at Gorgona.
Corozal at Culebra.

CULEBRA.

The Married Men took four games from the Independents at volley ball on Tuesday evening. The Married Men have finished their games, having won two and lost two.

The Cristobal bowling team took three games from the Culebra team at Culebra on Saturday evening, the following being the line-up and scores:

Culebra.				Cristobal.			
Baumer	164	176	131	Wheeler	161	133	170
Crain	154	163	143	Blackburn	195	191	166
Dundas	154	192	162	Collins	167	191	176
Driscoll	140	188	178	Bullard	183	187	176
Herrington	126	161	181	Louch	190	209	152
Total	738	880	795		912	910	840

The first game of basket ball of the Isthmian league between Culebra and Empire was played on Saturday evening at Culebra with the following line-up and score: Culebra 24, Empire 8.

Empire.	Culebra.
King	Kaperski
Koperski, R	Bartlett, F
Adams	Bartlett, E
King, B	Barcroft
Giovalli	Wilmot
	Chapman
	Hepler

The following high scores were rolled during the week. Big Pins—Case 207, 200; Duckpins— Fox 100, 104, 107; McIlvaine 104; Case 106.

EMPIRE.

The following high scores were bowled during the week; Ten Pins—Parkis 204, 214, 202, 210, 204; Rodeigheiro 220; Gustaveson 201, 202; Giavolli 220; Huson 204; Snyder 207. Duckpins—Pulsifer 108; Grund 104, 105; McLeod 101; Marshall 110; Rodeigheiro 104, Pinney 105; H. King 103, 101; Dakin 102.

The league games bowled on Empire alleys on Saturday night, October 7, resulted as follows:

Empire.				Gatun.			
Gust'son	161	169	191	O'Meara	139	141	164
Spinks	155	156	181	Chamb'lain	176	154	152
Gorham	184	154	134	Galloway	165	148	152
Pearson	189	178	179	Severn	179	151	139
Huson	158	182	180	Barte	141	165	166
Total	847	839	865		800	759	755

On Saturday night, October 14, Cristobal will bowl on the Empire alleys in the league series.

The Cristobal basket ball team will play the Empire team on the 14th, at Empire. This is the first game of the league to be played at Empire and a lively contest is assured.

At the meeting of the Literary and Debating Society held on Friday, October 6, Dr. Orenstein of Panama gave a talk on "National Vitality." A general discussion followed. The next weekly meeting will be beld on Friday, October 13.

Twelve men have entered the billiard tournament which started on Monday, October 9.

GORGONA.

Gynasium class, which has been held on Monday and Thursday nights, has been discontinued, and those nights will be given over to basket ball practice, preceded by calisthenics.

The local team took three games at bowling from

Camp Elliot on Saturday night, on the local alleys. The scores were as follows:

Camp Elliot.				Gorgona.			
McDowell..	161	125	128	M. Van....	200	170	188
Wright.....	131		110	R. Van.....	162	145	110
Martins....	136	120		Roper......	148	148	142
Austin.....	148	159	170	Sexton.....	157	186	212
Clouse.....	154	128		Haggerty...	170	136	178
Caltado....		139	138				
Total....	730	671	673		837	785	830

Seventy-five people attended the song service on Sunday night. Mrs. Shady played the piano, and Ernest Reinhold the violin.

The following men are entered to date in the local billiard tournament, which will start October 16: Geo. W. Strong, R. A. Montgovery, Wm. Ashman, Dr. C. A. Funk, Thos. Ryan, Thos. Bailey, H. Berman and C. A. Sims. A cue will be awarded the winner.

GATUN.

The Gatun-Cristobal basketball game was played on Friday night, October 6, instead of October 7, as scheduled. The line-up's were;

Gatun.		Cristobal.
Wilson	R. F.	Luce
Whiston	L. F.	Sarter
Sherrard, Wright	C.	Weller
Brown, Minotti	L. G.	Swallenberg
Fitzpatrick, Mitchell	R. G.	Sterner

Score—Cristobal, 23, Gatun, 12.

Joseph Mitchell has been elected Captain and Fred Huber , Manager of the basket ball team.

Gold and silver medals will be given as prizes for three-cushion billiard and class A and B pool tournaments now being held. The man making the highest single run in pool will receive a cue.

Gatun lost two games out of three on Saturday, October 7, in a match game of bowling with Empire on the local alleys.

The "Daily News" is the newest feature at the Club House. It consists of a large card board bulletin announcing in brief form the latest and most important foreign and local news items.

CRISTOBAL.

The Literary and Debating Club held an open meeting on Wednesday night, the program being in the form of a political convention. It was interspersed with the singing of patriotic songs by the audience, and songs by a quartette from Corozal. Presidential nominations were made as follows: Insurgent party, Sen. La Follette, by E. D. Nelson; Democratic party, Woodrow Wilson, by C. H. Elliott; Suffragette party, Laura Jean Libby, by C. J. Dinnan; Republican party, W. H. Taft for re-nomination, by C. P. O'Neal. After nomination speeches, a ballot was taken by the audience, resulting as follows: Woodrow Wilson, 57; W. H. Taft, 55; La Follette, 26; Laura Jean Libby,5; Attendance, 214.

The program for the meeting of October 18 will include an address on "The Installation and Operation of Lock Machinery," by Lewis Mason.

The Ten Pin Bowling League games on Saturday night resulted in Cristobal's taking two out of three games from Culebra by the following scores:

Cristobal.				Culebra.			
Barrett.....	201	179	190	Hostetter...	122	144	166

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Cristobal, C. Z., on Sunday, October 15, 1911, at 4.30 p. m.

The next concert will be given at Culebra, C. Z., on October 22, at 5.45 p. m.

OFFICIAL CIRCULARS.

Superintendent of Clubhouses.

CULEBRA, C. Z., September 23, 1911.

CIRCULAR No. 412:

Effective this date, Mr. Alfred B. Dickson is appointed Superintendent of Clubhouses, vice Mr. Floyd C. Freeman, resigned.

GEO. W. GOETHALS,
Chairman.

Loss of Locomotive Tools and Oiling Equipment.

CULEBRA, C. Z., September 28, 1911.

CIRCULAR No. 411:

My attention has been invited to the frequent loss of locomotive tools and oiling equipment, resulting, in most cases, from the failure of engineers to see that tools and oil boxes are properly locked before they leave their engines.

Boxes and chains with locks for securing tools, etc., being provided on each locomotive, the loss of such equipment from this cause is inexcusable, and any such loss will, in the future, subject the engineer responsible to discipline.

Locomotive engineers will be expected to see that their engines are provided with a sufficient number of locks and boxes to insure the proper safeguarding of this equipment, and in any case in which locks or boxes have been broken and the equipment removed, they will be expected to report the same promptly to the foreman of the engine house where engine is tied up when not working, who shall, in turn, report the facts to the yardmaster.

Hostlers handling engines at the different points will be required to make personal inspection of all engines immediately upon reporting for duty and to report to the foreman of the engine house any infraction of this order.

In order to assist in the identification of locomotive tools, etc., all such equipment will be numbered by the Mechanical Division with the number of the locomotive to which the same belongs. This numbering will be performed at the different houses upon the delivery of the equipment there by the different divisions concerned.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Hiring of Gold Employes.

CULEBRA, C. Z, October 9, 1911.

CIRCULAR No. 262-F.

Circular No. 262-E is hereby amended by the addition of the following paragraph:

> 13. **Hiring of Gold Employes on Isthmus**—No person will be employed on the Isthmus on the gold roll in any shop without the prior approval of the Inspector of Shops.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Laborers' Clearance and Identification.

CULEBRA, C. Z., September 27, 1911.

CIRCULAR No. 229-U:

Effective October 1, 1911, laborers entering the service on the hourly silver roll will be required to serve at least three months at the rate of pay below that of the gang to which they are assigned, unless such new employes furnish a clearance showing that their previous service was terminated on account of lack of work or reduction of force, this clearance to be attached to an identification certificate (Form X-143) properly made out.

The possession of a contract check will not entitle the holder to any special privileges unless he can satisfactorily prove as above provided or by other evidence that the contract was not forfeited due to the fault or volition of the laborer.

These instructions apply to both European and colored laborers, except when assigned to gangs paid the minimum rate of ten cents per hour.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Rainfall from October 1 to 7, 1911, Inclusive.

Supplies for the Canal.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon and Balboa during the week ending October 7:

Prinz Aug. Wilhelm, October 2, from New York, with 38 cases picks, 15 cases lanterns, 50 bundles wire, 235 cases blasting caps, for stock; 13 cases machinery, for Atlantic Division.

Acapulco, October 3, from San Francisco, with 13 crates stovepipe elbows, for stock.

Abangarez, October 5, from New Orleans, with 35 pieces piling for Atlantic Division; 10 pieces piling, 5452 pieces yellow pine lumber, 15 rolls cotton duck, 190 bales rice straw, 911 bales hay for stock; 377 pieces white oak lumber, 2,031 pieces yellow pine lumber, for Mechanical Division; 12 crates concrete mixers, for Pacific Division; 6 crates concrete mixers, for Panama Railroad Company.

Santa Marta, October 5, from New York, with 25 coils rope, 25 cases fuse, 32 cases rubber hose, 427 drums kerosene, for stock.

Panama, October 5, from New York, with 18 cases insulated wire, 8 pieces lumber, 120 pieces switches, 45 pieces railroad frogs, 7 cases switch fittings, 136 barrels caustic soda, 24 bales rubber hose, 160 coils rope, 91 kegs galvanized iron spikes, 100 cases varnish, 28 cases picks, 75 cases sal-soda, 10 kegs lump chalk, 40 cases metal polish, 14 cases copper tacks, 53 cases air brake material, 27 cases ink, 9 cases mucilage, 9 cases milk cans, 400 cases washing powder, 25 bundles scythe snaths, 8 drums zinc, 20 cases car seals, for stock; 395 barrels sand, 37 crates fire brick, 93 cases brake shoes, 9 barrels crucibles, 73 packages locomotive cranes, for Mechanical Division; 120 cases bolts, 15 cases copper tubes, 10 cases electrical material, 20 rolls wire cloth, 9 cases filter plant material, for Atlantic Division; 88 cases bolts, 18 bales fog horns, 8 cases pumping machinery, for Pacific Division; 110 packages drugs and sundries, for Sanitary Department; and a miscellaneous cargo, the whole consisting of 2,871 packages, weighing 300 tons.

Lost—Between pier 11, Cristobal, and house 4, Colon Beach, a string of gold beads. Reward if returned to Mrs. J. P. Mead, Colon.

Sale of Horizontal Stationary Gasoline Engine.

Sealed bids will be received at the office of the Depot Quartermaster, Mount Hope, until two o'clock P. M., October 16, 1911, when they will be opened in the presence of attending bidders, for one 2½ horse power "Williamsport Special" horizontal stationary gasoline engine, complete with battery box, cooling tank and driving belt. Engine can be seen and examined on any working day between the hours of seven to eleven A. M., and one to five P. M., upon application to this office. The right is reserved to reject any or all bids. Bids must be plainly marked "Proposal to purchase one stationary gasoline engine, to be opened October 16, 1911," and addressed to the Acting Depot Quartermaster, Mount Hope, C. Z.

CHARLES L. PARKER,
Acting Depot Quartermaster.

MOVEMENT OF OCEAN VESSELS.

The following is a list of the sailings of the Panama Railroad Steamship Company; of the Royal Mail Steam Packet Company; of the Hamburg-American Line, and of the United Fruit Company's Line; the Panama Railroad Company's dates being subject to change.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, OCTOBER 18, 1911. No. 8.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Chairman's Report.

The report of the Chairman of the Isthmian Canal Commission for the month of September is published in full in other columns of this issue of THE CANAL RECORD. It gives a detailed account of the progress of the Canal work in all departments and divisions.

Pedro Miguel Locks.

An effort is being made to complete the back fill on the west side of Pedro Miguel Locks by November 1, in order that it may be used by the lock gate contractor as a storage yard for materials for the lower guard and operating gates. On October 16 there remained to be filled an area that will require about 30,000 cubic yards of material. Spoil from the lock site at Miraflores has been used up to the present time, but this week there will be added to this, seven or eight trains daily of excavation from Culebra Cut, averaging about 380 yards to a train. In all it is expected that about 3.500 cubic yards a day will be dumped between now and the end of the month. In making the climb from the south end of the locks to the level of the top of the walls the trains go up 60 feet in about a quarter of a mile.

The placing of material for the north guard gates is about half completed, this work having been delayed by non-delivery of material from the States. In order to expedite the gate erection. the contractor will build a second construction bridge over the lock chambers, from which materials for the lower guard and operating gates will be lowered into place. Thus, work on all four gates at Pedro Miguel will be in progress at one time.

Concrete laying is so nearly completed that only isolated portions remain to be done. At the north end, the slow and intricate work of placing the three gate valves in each of the side wall intakes and the sluice gate of the center wall intake, is in progress. At the south end, excavation for the outlet on the east side has been completed and concrete laying is in progress. A 70-ton shovel is completing the excavation for the southeast wing wall, and concrete work will be begun in a few days. As soon as it has finished digging at this point, the shovel will be taken to the hill that rises above the lock walls on the east side, and there will excavate for the back fill of the east wall

In the west chamber at the south end, the laying of the floor south of the caisson sill is being expedited. When this is in place the drainage water from Culebra Cut, which flows through the center culvert of Pedro Miguel locks and from the outlet through the approach to the east lock, will be diverted to the west approach, in order that the floor in the east approach may be finished.

Surplus of Common Labor.

The Isthmian Canal Commission wishes to announce that there is on the Isthmus at present a surplus of unemployed labor both European and West Indian. If laborers are desired by any recruiting agents, the agents should notify the Chief Quartermaster, Culebra how many men they can give employment, where they are to go, and what wages will be paid them. The Chief Quartermaster will then send the agent such men as desire to accept the terms offered This will continue in force so long as surplus labor is available.

North Guide Wall at Miraflores Locks.

Work on the north guide wall at Miraflores Locks was begun on September 30, when an experimental caisson was sunk for one of the foundation piers. The plant for sinking the remainder of the 250 caissons is nearing completion, and will be in operation this week.

This wall will be a cellular, reinforced concrete structure extending into Miraflores Lake from the north end of the center wall of the locks, and will serve the double purpose of guiding ships into the locks and of carrying the towing locomotives that will take hold of vessels in the approach. It will be 1,185 feet long, 58 feet wide, and will be composed of two face walls of reinforced concrete from 14 to 23 inches thick, depending on the depth below the top of the wall, with cross walls 18 inches thick on centers of 15 feet. Thus it will be a series of cells about 54 feet across and 18½ feet longitudinally. At the north end the wall will be solid for 31 feet 6 inches.

The rock upon which Miraflores locks are founded dips at the north end of the lock site and at the beginning of the guide wall is about 10 feet below sea level, while at the end it is 48 feet below. In order to avoid excavation and to economize on concrete, the wall will be founded upon concrete piers sunk to rock. The work now in progress is the sinking of of caissons for these piers. The caissons are made of reinforced concrete in steel forms, in six foot sections, and are 5 feet 6 inches at inside diameter and 7 feet 6 inches at outside, the shell being thus one foot thick. They will be sunk in three rows, longitudinally at 15 foot intervals, and laterally on 27 foot centers except under the solid portion where there will be four rows. It is proposed to work on eight at one time, and to this end eight working platforms have been erected on skids, so that they can be moved from one series of caissons to another as the work is completed.

By means of a rope drive a series of eight pulleys, one to each platform, is kept moving constantly. Each pulley is direct connected to a "nigger head," and the operation of lifting a bucket of spoil from the caisson pit is accomplished by a double turn, on the "nigger head," of a rope that passes through a block immediately over the caisson. The spoil will be hauled to the dumps nearby in Decauville cars. When the caissons are down to rock they will be filled with concrete.

Gatun Spillway Program.

During the period from the present to January 1, 1912, work on the spillway of Gatun Dam will be confined to the construction of the machinery tunnel to 69 feet above sea level, the lower portion of the crest piers outside the channel of flow, the lower portion of abutments, flare walls, and approach walls. Work is now in progress on the forming for the machinery tunnel, 8 by 10 feet, which will extend the entire length of the concrete dam. A program for the construction of the spillway dam and works has been prepared as follows:

PERIOD JANUARY 1, 1912 TO APRIL 30, 1912.

Closure of channel of flow to elevation plus 50; and installation of sluice gates with operating machinery on piers at elevation plus 70. Estimated concrete, 25,710 cubic yards, an average of 257 cubic yards per working day.

Every possible perparation will be made before January first for doing this work at the maximum practicable rate. Equipment for placing concrete, handling forms, etc., will consist of three derricks with 70-foot boom so placed as to cover the full channel width; and movable chutes for depositing concrete at any point directly from dump cars. These facilities provide for placing concrete at over four times the required average rate.

During January and part of February, when the river flow is considerable, it is proposed to coffer off not more than two-thirds of the channel, completing the closure and opening the sluiceways not later than February 28, when the discharge has dropped to about the minimum. Arc lights will be installed so that any night work necessary to advance the work may be advantageously prosecuted.

PERIOD APRIL 30, 1912 TO AUGUST 1, 1912.

Sluice gates are to be closed at the beginning of this period and with normal flow, the lake will reach plus 50 at the end thereof. All concrete and bulkhead closures needed to force flood flow over central portion of dam at plus 50, as well as trash racks, pipes, control gates, etc., in hydro-electric plant forebay, will be placed during May. Thereafter, abutments and adjacent walls and crest piers will be carried toward final levels, working from a trestle at elevation plus 93. Estimated concrete, 8,800 cubic yards, an average of 117 cubic yards per working day.

PERIOD AUGUST 1, 1912 TO JANUARY 1, 1913.

Concrete force will be employed principally in the construction of the hydro-electric plant. On the Spillway dam about 2,500 cubic yards will be placed, carrying crest piers outside channel of flow to final heights. This work to be done from trestle at plus 93 on top of ogee. If crest gates and foot bridges are ready, they will be placed during this period on the practically completed flanks of the dam. A study of maximum discharge for various periods indicates that the lake level

NOTES OF PROGRESS.

(Continued.)

will probably not exceed plus 59 under the conditions obtaining.

PERIOD SUBSEQUENT TO JANUARY 1, 1913.

By manipulating the sluiceway gates, the lake will be held at about plus 50, and the machinery tunnel, ogee to plus 69, and lower portion of crest piers will be completed across the channel of flow. Estimated concrete, 10,375 cubic yards to be placed by April 1, average per day 138 cubic yards.

After April 1, the trestle at plus 93, already built along the top of the flanks of the dam, will be joined across the central portion; the remaining crest piers carried to final elevation (5,960 cubic yards), the sluiceways filled (1,231 cubic yards), and gates and machinery of same removed, about April 30; the crest gates and foot bridge placed by wrecking cranes working from the plus 93 trestle; machinery installed in tunnel; and the dam completed. With normal flow, the lake will gradually rise from plus 50 on April 30, to plus 69 on August 1.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is about 70.5 per cent completed, 158,642 cubic yards, out of a total of 225,000, having been placed at the close of work on October 14. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
October 9	156	7.30	1
October 10	126	7.00	1
October 11	88	4.30	1
October 12	152	7.30	1
October 13	168	8.00	1
October 14	100	5.30	1
Total	800	40.00	1
Previously reported	157,842

October 13	8.05	2,969
October 14	7.50	2,614
Total	44.40	15,631

Municipal Improvements in Panama.

Work has been begun on the improvements in the streets of the city of Panama which were requested by the Secretary of Foreign Affairs of the Republic in a letter to the Head of the Department of Civil Administration of the Canal Zone, March 28, 1911. Under the contract of July 1, 1910, such improvements are to be made by the Commission, and when paid for by the Republic of Panama they become the property of Panama.

The streets to be improved at this time are Ancon Boulevard, 1,700 feet long, which runs south from Fourth of July Street, in a direction generally parallel to the Zone Line Road, and intersects the Balboa Road two blocks east of the Protestant cemetery; what is unofficially known as Magoon Street, running from the Zone Line Road at a point just north of the National Institute, to Central Avenue at its intersection with Lyons Street, 1,050 feet; two blocks of West Seventeenth Street, north from the Balboa Road and east of Ancon Boulevard, 690 feet; and an extension of C Street west from Sixteenth Street to Ancon Boulevard, two blocks, 600 feet. In all, 4,040 feet of street along which 8-inch sewer and 6-inch water mains are to be laid, the surface graded and macadamized, and gutters and curbing set. The water main is to connect with the main on Fourth of July Street, while the sewer system will drain to the west, through the Cocoa Grove section, to the Bay of Panama. The cost is estimated at $27,500.

CONCRETE WORK IN THE LOCKS.

Over 68 per cent of the concrete for the locks is in place, the amount at the close of work on October 14, being 2,860,117 cubic yards, out of a total of approximately 4,199,400. A total of 32,882 cubic yards of concrete was laid in the locks during the week ending October 14.

GATUN LOCKS.

Over 82 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on October 14 being 1,647,693 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending October 14, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

EXECUTIVE ORDER.

To Amend Sections 51, 62, and 526, and to Repeal Sections 63 and 529 of the Code of Civil Procedure of the Canal Zone.

By virtue of the authority vested in me, I hereby establish the following Order for the Canal Zone:

ARTICLE I: Section 51 of the Code of Civil Procedure of the Canal Zone is hereby amended to read as follows:

> *Section 51:* Pleadings in the District Courts shall be oral, except when they are required by law to be verified by the oath of either of the parties to the suit, in which case the pleadings shall be in writing.

ARTICLE II: Section 62 of the above mentioned Code is hereby amended so as to read as follows:

> *Section 62:* Every District Judge shall keep a well bound book styled "Docket," in which he shall enter the name and style of every civil suit brought before him; the dates of issuing process therein and of the return thereof; a brief statement of the nature of the suit and of any plea made thereto by the defendant, and if no appearance is made, the defendant's default shall be noted; the names of the witnesses sworn; the date and the amount of the judgment; the date of issuing execution or other process upon the judgment, and a copy of the returns theron; the appeal, when and by whom demanded; and briefly all the proceedings before him touching the suit.
>
> Each District Judge, at the beginning of his docket and before any entries are made therein shall make and subscribe the following certificate, substantially, to-wit:—
>
> "A docket of proceedings in civil matters before ...., District Judge of the Administrative District of ...., Canal Zone.
>
> Witness my signature..................
>
> District Judge"

ARTICLE III: Section 526 of the above mentioned Code is hereby amended so as to read as follows:

> *Section 526:* Costs shall ordinarily be allowed to the prevailing party as a matter of course. but the court shall have power for special reasons to adjudge that either party shall pay the costs of an action or that the same be divided as may be equitable; and the court may, for sufficient cause, order that no costs be taxed against either party to any suit or special proceedings.

ARTICLE IV: Sections 63 and 529 of the Code of Civil Procedure are hereby repealed.

ARTICLE V: This Order shall take effect 90 days from and after this date.

WM. H. TAFT.

THE WHITE HOUSE,
Sept. 26, 1911.

Pilots, Mates, Masters, Engineers, Chauffeurs.

Examinations for pilots, mates, masters and engineers, and for chauffeurs, will be held by the Board of Local Inspectors at the Administration Building, Ancon, on October 25. All applicants for licenses as chauffeur must secure from the Department of Civil Administration, Executive Office, Ancon, forms of application, and information respecting the filling out of the same, not later than the day previous to the examination. All applicants for examination must be present at the Administration Building at 8.00 a. m. on October 25, with papers in proper form. In addition, applicants for chauffeurs' licenses must demonstrate their capacity properly to operate an automobile, and must have the autobile with them.

Rodmen and Levelmen.

An examination to test the fitness of rodmen and levelmen for promotion will be held at Culebra on Sunday, October 29. Employes wishing to enter this examination should forward their applications through the head of the department or division in which they are serving to Mr. A. B. Nichols, chairman of the examining board, Culebra.

PERSONAL.

Among the passengers on the *Colon*, which will arrive on October 18, are Mr. H. H. Rousseau, with Mrs. Rousseau and child, and Mr. Henry Goldmark and family.

A party of Senators and Representatives, including Senators Brandegee, of Connecticut, Cummings of Iowa, Wetmore of Rhode Island, Overman of North Carolina. Brown of Nebraska, Bristow of Kansas, Thornton of Louisiana, and Jones of Washington, are among the passengers on the *Ancon*, due to arrive at Cristobal on October 22.

Obituary.

C. B. West, an employe of the Central Division at Empire, died at Colon Hospital on October 11, 1911. He was 44 years of age, married, and had been on the Isthmus for six years, having come here from New York. He is survived by his wife.

John P. Thayer, whose last residence in the States was at Ardmore, Okla., died in Santo Tomas Hospital, Panama, on October 11, of Bright's disease. He entered the employ of the Commission on December 15, 1905, resigning on January 30, 1911 to become Assistant Chief Engineer of the Republic of Panama. He was 50 years of age, and is survived by his wife and two children.

United Fruit Company's New Ships.

Three new ships, the *Carrillo*, *Tivives* and *Sixola*, are nearing completion at Belfast for the United Fruit Company. The *Carrillo* is scheduled to arrive at Colon on Thursday, October 25, after making a stop at Kingston. The *Tivives* is scheduled to arrive at Colon on either Wednesday, November 8, or Thursday, November 9, after making a stop at Kingston. The *Sixola* is scheduled to arrive at Kingston on Saturday, November 11, from where it will be dispatched to New Orleans direct at the earliest possible date.

The sailing from New Orleans of the *Parismina* on October 18, and that of the *Heredia* on November 1, will be cancelled and their places taken by the *Carrillo* and *Tivives* respectively.

United Spanish War Veterans.

At a meeting of Chagres Camp No. 2, U. S. W. V., at Culebra on October 8, a resolution of sympathy addressed to Mrs. Winfield Scott Schley was adopted on account of the death of Rear Admiral Schley, who was a comrade of Harden Camp of Washington.

The dedication and blessing of the Catholic chapel at Gatun took place on Sunday, October 2, by the pastor, the Rev. M. A. Jiamona. Mass was sung by the Misses Butler of Cristobal. The chapel was decorated by the ladies of the Altar Society. The Rev. Jiamona leaves for a five months visit to Rome on October 17, and during his absence mass will be celebrated by the Rev. José de Ruggero of Panama.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The schedule of moving picture entertainments for the week October 23 to 28, follows: Monday, Gatun; Tuesday, Cristobal; Wednesday, Gorgona; Thursday, Corozal; Friday, Empire; Saturday, Culebra.

The standing of the Isthmian Basket Ball League on October 14, follows:

Team.	Won.	Lost.	P. C.
Cristobal..........	2	0	1.000
Culebra...........	1	0	1.000
Gatun.............	2	2	.500
Gorgona...........	2	2	.500
Empire............	0	2	.000
Corozal...........	0	1	.000

The standing of the teams in the Isthmian Bowling League on October 14, follows:

Team.	Played.	Won.	Lost.	P. C.
Empire.....	42	32	10	.761
Cristobal....	42	24	18	.571
Gatun......	42	24	18	.571
Gorgona.....	42	22	20	.523
Marines.....	36	13	17	.433
Culebra.....	36	9	27	.250

CULEBRA.

The bowling game between the Marines and Culebra, which was to have been rolled Saturday night, has been postponed until Thursday night, October 19.

The high scores rolled during the week are as follows: Ten Pins—Dougherty 220; Case 200; Mitchell 200; Mengel 207, 211. Duckpins—Hobart 107, 102.

COROZAL.

On Saturday night October 21, the basket ball team will play the Gatun team at Gatun

A general course in "Studies in Social Reform and What to Do" will be started at the Clubhouse on Wednesday night, October 25. At the first meeting, the subject of accidents will be taken up for discussion. All men are invited to attend the class and take part in the discussions.

EMPIRE.

In the league games bowled on Saturday October 14, on the Empire alleys. Empire took two out of three games. The scores were as follows.:

Empire: 790. 802, 957. Cristobal: 746, 872, 930.

On Saturday, October 21, Camp Elliott will bowl on Empire alleys in the league series.

The basket ball game between Empire and Cristobal played on Empire court October 14, resulted in Cristobal winning by a score of 20 to 14. On Saturday, October 21, the Gorgona team will play at Empire.

GORGONA.

On Saturday night the Gorgona bowling team took two out of three games from Gatun on the local floor. In the last frame of the last game Gatun was ahead, each team having taken one of the preceding games, when Haggerty made a strike out, putting Gorgona ahead by two points. The scores were as follows:

Gorgona: 773, 781. 786. Gatun: 662, 799, 784.

In basket ball, Gatun defeated Gorgona on the local floor last Saturday night, by a score of 22 to 11

Next Saturday evening the local team will play at Empire.

John C. Kendall has presented the clubhouse with three hand-made orchid baskets, filled with many varieties of orchids gathered from the jungle.

GATUN.

Gatun took all three games of bowling with Gorgona at Gatun on Saturday, October 14.

Mr. R. L. Dwelle, formerly of the Greenpoint Branch Y. M. C. A., Brooklyn, has arrived on the Isthmus and taken up his duties as Physical Director of the Gatun Y. M. C. A. The gymnasium classes will continue to meet Tuesdays and Fridays with basketball practice on Monday and Thursday evenings.

On Monday afternoon the Boy's Department will be reorganized and placed under the direction of Mr. Dwelle. The boys will have regular gymnasium classes various teams well be formed, hikes and trips taken and an atheletic meet will be held. There are twenty one boys in the junior Department.

CRISTOBAL.

The address by L. A. Mason, of Culebra, on the Installation and Operation of Lock Machinery, scheduled for October 18, has been postponed to Wednesday, October 25.

A Bible study club has been organized and will hold its first session on Monday, October 22, and there will be meetings for twelve consecutive weeks.

The Culebra basket ball team will play the Cristobal team on the local floor on Saturday, October 21.

The Gatun bowling team will bowl the local team at Cristobal on Saturday, October 21.

The Empire bowling team took three games from Cristobal on Saturday evening, October 14. by the following scores:

Empire: 875, 843, 819. Cristobal: 863, 814, 784.

CANAL WORK IN SEPTEMBER.

Monthly Report of the Chairman and Chief Engineer to the Secretary of War.

CULEBRA, C. Z., October 12, 1911.

The Honorable the Secretary of War,
Washington, D. C.

SIR: I have the honor to submit the following report of operations on the Isthmus for the month of September, 1911.

Department of Construction and Engineering.

The following table summarizes the principal items of construction work accomplished by the Atlantic, Central and Pacific Divisions during the month:

ITEM.	Unit.	Atlantic.	Central.	Pacific.	Total.
Work excavation, dry	Cubic yards	77,976	1,351,445	136,681	1,566,102
Work excavation, wet	Cubic yards	420,434	10,000	534,667	965,101
Total work excavation	Cubic yards	498,410	1,361,445	678,909	2,538,764

First Division, Office of the Chief Engineer.

MASONRY AND LOCK STRUCTURES.

The material under contract for work designed in this subdivision, as stated in reports for previous months, is being inspected by the force of the General Purchasing Officer in the United States, and the erection work on the Isthmus is being conducted by the Division Engineers, under supervision of this office. The field work consisted of setting of Stoney valve fixed irons in the masonry; measurements of emergency dam sills at Gatun; experiments of flow of water through orifices, and final hydraulic test of Stoney valves at Gatun.

LOCK GATES AND PROTECTIVE DEVICES.

Up to September 20, a total of 33,330 tons of material had been accepted at the mills, about 1,600 tons having been accepted at the mills during the month; and a total of 20,765 tons, or about 40 per cent of the total contract, had been shipped to the Isthmus.

All of the material required for the 54′ 8″ upper guard gates, for the 77′ upper and middle gates, and 97 per cent of the material required for the 77′ safety and lower gates at Gatun; and all of the material required for the 54′ 8″ upper gates, 92 per cent of the material for the 79′ upper and middle gates, and 22 per cent of the material required for the 79′ safety and lower gates at Pedro Miguel, has been accepted and shipped.

At Gatun, all structural material required in the construction of leaves 37 and 38, upper guard gates, east lock, with the exception of the footwalks, fender angles, manhole covers, etc., has been erected in place. The interior riveting of these leaves is practically completed, and of the exterior riveting, about 40 per cent has been done. All structural material required in the construction of leaves 39 and 40, upper guard gates, west lock, with the exception of the sheathing plates, footwalks, fender angles, manhole covers, etc., has been erected in place. Practically all interior riveting, but only about 5 per cent of the exterior riveting, has been done.

At Pedro Miguel, about 41 per cent of the structural material for leaves 50, 51, 52, and 53, upper guard gates, east and west lock, has been erected, of which 20 per cent has been riveted in place.

Satisfactory progress has been made on the erection and adjustment, as well as in the babbitting, of the nickel steel bearing plates in the hollow quoins at both Gatun and Pedro Miguel. Owing to discrepancies in alignment of bearing plates in quoin for leaf No. 36, Gatun, the acceptance of this quoin has been withheld since June, pending satisfactory disposition of same by the contractor.

INSPECTION OF OPERATING MACHINERY AND ELECTRICAL EQUIPMENT.

The force of this subdivision, reporting directly to this office, has cared for the technical matters relating to inspection as follows:

(1) For the Stoney and cylindrical valve machines, purchased under Circular 614: Preparations have been made for test of the first Stoney gate valve machine which has been erected in the shops of the contractor, and tests were to have been started about the middle of the month. Complete tests have been made on one cylindrical valve machine. This machine was first assembled at the works of contractor with driving motors of different manufacturers. Later the machine was tested under various loads, and, but for a few minor details, the tests show the machines to be satisfactory.

(2) For the rack railway and other material purchased under Circular 619: A large quantity of conductor rail material for section 8, the lower portion of Pedro Miguel approach and wing walls, was shipped from the works of the contractor. Satisfactory progress is reported on the various castings and malleable iron cover plates; also on bolts, nuts and small parts, and on the bumping posts. The contractors have been having considerable difficulty in producing castings for the rack which are free from shrinkage cracks and washouts.

(3) For the gate operating machines, Class 1, and miter forcing machines, Class 2, purchased under Circular 627: Satisfactory progress is reported upon the sample machines.

(4) For the gate and girder hoisting machinery for the emergency dams: Testing rig has been completed and erected for testing out the worm gearing of the hoisting machines purchased under Circular 616.

Considerable material under the above contracts has been received on the Isthmus and inspected and checked upon its arrival.

A force has been organized for the erection of the machinery and the installation of the electrical apparatus on the Isthmus, and work preliminary to placing the first machines was commenced during the month.

EMERGENCY DAMS.

The inspection in the United States under this subdivision progressed satisfactorily during the month. Up to the 20th of the month, a total of 213 drawings for the turning and wedging machinery had been approved. At the works of the contractors about 225 tons of nickel steel and about 43 tons of carbon steel were rolled during the month. Satisfactory progress has also been made in the manufacture of roller bearings for the gates of the emergency dams.

AIDS TO NAVIGATION.

During the month 80½ acres of land were cleared in the vicinity of Pena Blanca for sites for beacons and reference buoys, at an average cost of $9.82 per acre; 42,200 lineal feet of trochas were cut; and the necessary land for making surveys was cleared and profile taken. The places for sixteen gas buoys were located and referenced at Mamei, Juan Grande and Santa Cruz, and between Pena Blanca and Trinidad P. I.

Work on the construction of Range No. 9-11, Pacific Division, was begun on September 5, and at the close of the month the caisson foundation for Light No. 9 was completed to a height of 8 ft., and the forms were placed in position to pour the concrete for the walls. The foundation pier for Light No. 11 was completed to its required height, and the erection of the steel forms for the tower was under way. Preliminary work was undertaken for constructing the foundations of the front light of Range No. 13-14, Pacific Division.

CONTRACTS, IN FORCE AND UNDER ADVERTISEMENT.

Circular 513—Anchorages for lock gates; United Engineering & Foundry Co., contractors. All material under this contract has been shipped to the Isthmus, but approximately $5,000 of final payment is withheld to cover defective nickel steel bearing plates and stud bolts.

Circular 576—Lock gates for all locks; McClintic-Marshall Construction Company, contractors. Forty per cent of the material has been shipped.

Circular 594—Class 1. Fixed irons for Stoney valves; Wheeling Mold and Foundry Company, contractors; contract 90 per cent completed.

Circular 614—Class 1, Item 1: Two stoney gate valve machines, except motors; Wheeling Mold and Foundry Company, Contractors. Contract practically completed. Item 2; 114 Stoney gate valve machines, except motors; contract to be awarded after test of machines under Item 1.

Class 2, Item 1—Two cylindrical valve machines, except motors; Wheeling Mold and Foundry Company, contractors. Contract practically completed. Item 2. 118 cylindrical valve machines, except motors; contract to be awarded after test of machines under Item 1.

Class 3, Item 1—2 motors for Stoney gate valve machines; sample motors purchased from General Electric Co., Westinghouse Electric & Manufacturing Company, and Allis-Chalmers Co. Contract 100 per cent completed. Item 2—114 motors for Stoney gate valve machines; to be awarded after test under Item 1.

Class 4, Item 1—2 motors for cylindrical valve machines; sample motors purchased from above three manufacturers; 100 per cent completed. Item 2—118 motors for cylindrical valve machines; contract to be awarded after test of motors under Item 1.

Class 5, Items 1 and 3—2 limit switches purchased from General Electric Co., Westinghouse Electric and Manufacturing Co., and Cutler-Hammer Mfg. Co.; 100 per cent completed. Items 2 and 4—Limit switches for 114 Stoney gate and 118 cylindrical valve machines, respectively, to be awarded after test of limit switches under Items 1 and 3.

Circular 616—Six emergency dams; contract awarded to United States Steel Products Company; to complete delivery by June 15, 1913.

Circular 619—Rack railway material for all locks. Class 1, structural material; contractor U. S. Steel Products Company. Class 2, steel rack castings; R. C. Hoffman & Co., contractors. Class 3, cast iron and malleable iron castings; Ross-Meehan Foundry Co., contors. Class 4, copper and brass; U. S. Steel Products Co., and St. Louis Screw Company, contractors. Items 15 and 16, held in abeyance. Class 7, miscellaneous (steel bolts, etc.) Oliver Iron & Steel Co., contractors.

Circular 620—Lock gate recess covers; U. S. Steel Products Co., contractors. It is understood that four sets of covers have been shipped out of total of 80 required. Balance of this material will be ready for shipment within the next few weeks.

Circular 627, Class 1, Item 1.—2 miter gate moving machines except motors, Wheeling Mold and Foundry Co.. contractors. Item 2. —90 miter gate moving machines, except motors; award not yet made. Class 2, Item 1.—1 miter forcing machine, except motor; Richard Manufacturing Co., contractors. Item 2.—45 miter forcing machines, except motors; award not yet made. Class 3, Item 1.—2 motors for miter gate moving machines; award held in abeyance. Item 2.—90 motors for miter gate moving machines; contract not yet awarded. Class 4, Item 1.—motor for miter forcing machine; General Electric Company, contractors. Item 2.—45 Motors for miter forcing machines; award not yet made.

Circular 636, Class 1.—Spillway gates, etc.: McClintic-Marshall Construction Company, contractors. Class 2—Rising stem gate valves, etc.; McClintic-Marshall Construction Co., contractors. Class 3—Fixed irons for spillway gates; Excelsior Tool & Machine Co., contractors. Class 4—Roller trains and sealing devices; Westinghouse Machine Co., contractors. Class 5—Railings for spillways; Vulcan Rail & Construction Co.. contractors. No deliveries have yet been made.

Circular 636-D—Brass nuts, bolts and set screws. (Refer to Item 18 of Circular 619).

Circular 639—Structural steel for decking; United States Steel Products Co., contractors. No deliveries have yet been made.

Circular 647—Copper conductor bars and splice bars. Circular published August 24, bids opened September 23; award not yet made.

Circular 648—Plant and material for hydroelectric station. Circular published September 9; bids to be opened on October 24.

Circular 649—Fender chains; bids will be opened November 14.

Circular 650—Towing locomotives. Circular issued September 21; bids to be opened November 20.

Specifications have been forwarded to the General Purchasing Officer covering snubbing posts and washers, bolts and chains, and springs for fenders, but the material has not yet been advertised.

Atlantic Division.

GATUN LOCKS.

Excavation—Shovel excavation in the locks was completed. The total amount of material removed amounted to 5,920,085 cubic yards, of which 5,038,222 cubic yards were removed from the prism.

Backfill—Backfilling behind the side walls of the upper, middle and lower locks, and in the center wall of the uper lock, was continued. The quantity placed during September aggregated 114,229 cubic yards, increasing the total to 798,726 cubic yards. On September 30, the backfilling was 49.64 per cent completed.

Receiving and Issuing Material—The consumption of rock exceeded the receipts by 8,065 cubic yards and the consumption of cement exceeded the receipts by 12,494 barrels. The receipts of sand exceeded the consumption by 4,370 cubic yards.

Mixing and Placing Plant—Both plants, and all portable mixers, were kept in satisfactory operation during the month.

Power Plant and Pumps—The operation of the power plant and pumps was satisfactory.

Iron and Steel Work—During the month, 316.7 tons of fixed steel and 205,316 feet of reinforcing rods were placed; 61.1 tons of reinforcing rails and 440 feet of electric return track were laid.

Concrete Work—There was a decrease of 9,630 cubic yards in the amount of concrete laid as compared with the figures for the preceding month. The daily average for the 25 working days was 2,292 cubic yards, as compared with a daily average during August of 2,478 cubic yards. The total amount of concrete placed during the month was 57,298 cubic yards, including 1,634 cubic yards of large stone. Of the total concrete, 2,269.5 cubic yards were placed in the upper lock, 14,913.5 cubic yards in the middle lock and 40,115 cubic yards in the lower lock The concrete work for the entire lock system was 81 per cent completed at the end of September.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS.

	Permanent Plant.	Auxiliary Plant.

GATUN DAM.

Construction during the month increased the total fill, as determined by cross sections of the material in place, by 456,335 cubic yards, making the total amount in place 15,768,127 cubic yards.

Hydraulic Fill—The dredges increased the hydraulic fill by 261,838 cubic yards. The total hydraulic fill in place September 30, was 8,256,166 cubic yards.

Dry Fill—The material received from the Central Division, Mindi, and from steam shovels Nos. 116 and 134, amounting to 194,497 cubic yards, was placed on the north and south toes of the dam, east and west of the spillway, making the total dry fill in place 7,509,961 cubic yards.

GATUN SPILLWAY.

Excavation—In preparing foundations for the spillway dam, 359 cubic yards of rock and 217 cubic yards of earth were removed by hand. On September 30, the total spillway excavation amounted to 1,586,184 cubic yards.

Concrete—The work of placing concrete was continued. The amount placed during the month aggregated 3,650 cubic yards, which increased the total to 159,381 cubic yards. The concrete work for the spillway was 70.4 per cent completed.

Hydro-electric Plant—Excavation work for site of the power house was continued, a total of 1,210 cubic yards of earth being removed. The total excavation for this purpose at the close of the month was 21,835 cubic yards.

HARBOR AND CHANNEL SECTION.

Excavation below sea level at Mindi—During the month two steam shovels removed 17,609 cubic yards of earth and 56,878 cubic yards of rock from the canal prism

Dredging from the Ocean to Mindi—Five dredges removed 380,894 cubic yards of earth and 39,540 cubic yards of rock from the canal prism. In addition. the dredge *Caribbean* removed 39,867 cubic yards of earth from in front of dock No. 11 and the approach channel. On September 30th 40 feet of water could be carried from Zero to Zero plus 2,100 feet; 35 feet to Mile 3 plus 2,800 feet; 30 feet to Mile 4 plus 3,750 feet; 20 feet to Mile 5 plus 2,438.9 feet, at the junction with the French Canal.

PORTO BELLO.

PERFORMANCE OF ROCK CRUSHER PLANT.

Length of working days—hours	8.00
Average number of hours worked per day..	4.31
Average number of cubic yards per hour of working day	221.76
Average number of cubic yards per working hour	411.94
Maximum day's output, (5 hours 23 minutes) cu. yds.	2,186.00
Average day's output (25 days) cu. yds.	1,774.08
Average hourly output, (179 hours 59 minutes) cu. yds.	246.42
Total output for the month, cu. yds.	44,352.00

SAND, STONE, AND CEMENT SERVICE.

In connection with this service, plant steamed 6,295 miles, handled 793 barges and carried 3,120 passengers.

WEST BREAKWATER, COLON.

Thirty-four thousand four hundred and ninety-four cubic yards of rock were excavated, of which amount 33,813 cubic yards were placed in the breakwater and 681 cubic yards in track fill. The double track trestle was extended 513 linear feet. On September 30, the trestle extended 7,132 linear feet from shore. The total amount of rock dredged and dumped on the west breakwater to September 1, 1911, was 687,177 cubic yards. During the month 39,540 cubic yards of rock were dredged and dumped, increasing the total to 726,717 cubic yards. The amount of dry fill placed to October 1, was 488,984 cubic yards.

NOMBRE DE DIOS.

During the month 69 barges, containing 33,415 cubic yards of sand, were shipped to Gatun.

MUNICIPAL ENGINEERING.

The reservoirs, water mains, sewers, roads and oil pipe lines were maintained and extended as required to facilitate construction work.

Central Division.

During the month of September the total amount of material excavated in the Central Division was 1,361,445 cubic yards, of which 274,914 cubic yards were classified as earth and 1,086,531 cubic yards as rock. Of this quantity, 1,339,437 cubic yards were removed by steam shovels, 736 cubic yards by bucket crane, and contractors removed 10.000 cubic yards by sluicing and 11 ,272 cubic yards by hand. The total, 1,361,445 cubic yards, consisted of primary excavation for the canal prism.

The daily average number of steam shovels at work during the month was 42.00, and the total number of shovel days was 1,050. as compared with 40.66 at work during the month of August with 1,098 shovel days.

For comparison with the work done by steam shovels during the corresponding month of the previous year, the following table has been prepared:

Period.	Excavated by shovels.	Classification of material.		Av. No. of shovels at work	Wkg days.	Av. yards per shovel day.
		Rock.	Earth			
1910:	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*			*C. Y.*
Sept. . .	1,572,064	1,114,765	457,299	46.92	25	1,340.20
1911:						
Sept. . .	1,339,437	1,075,211	264,226	42.00	25	1,275.65

Rainfall at Empire: 1910, 8.99 ins.; 1911, 5.46 ins.

The above table shows the average output per shovel to be 4.82 per cent greater in September, 1910, than in the corresponding month of the present year.

The total amount of material excavated from the prism in the Culebra section of the Central Division in September, 1911, or 1,340,173 cubic yards, was the greatest record in that section for the month of September, the previous high record having been in September, 1910, when 1,339,948 cubic yards were removed.

The total estimated amount of material to be removed in the Central Division, according to revised estimate of July 1, 1911, was 101,801,296 cubic yards, and up to October 1, 1911, 81,524,091 cubic yards had been removed, leaving 20,277,205 cubic yards to be removed in order to complete all excavation in the Central Division. From these figures it will be seen that 80.08 per cent of all excavation in the Central Division had been accomplished up to the close of the month of September, 1911, and 19.92 per cent remained uncompleted.

Considering the two sections which compose the Central Division, the excavation completed and that to be completed at the close of September operations was as follows:

CULEBRA SECTION.	*Cu. Yds.*
Completed	69,635,273
To be completed	19,808,732
CHAGRES SECTION.	*Cu. Yds.*
Completed	11,888,818
To be completed	468,473

From the above figures it will be seen that the Culebra Section, locally known as "Culebra Cut," is 77.85 per cent completed with 22.15 per cent to be completed, the Chagres Section is 96.21 per cent completed with 3.79 per cent to be completed.

During the month 33,117 cubic yards of material were dumped in the embankment for the new roadbed for the relocation of the Panama railroad. The total amount of spoil from the Central Division used for this purpose at the close of the month was 3,954,428 cubic yards. The Central Division also delivered at Gatun 227,304 cubic yards of rock and earth for use in the construction of the dam, making the total for this purpose at the end of September, 4,456,271 cubic yards.

The daily average number of laborers at work on the whole Division during the month was 7,826, and the daily average number of gold employes was 783.

Pacific Division.

DISTRICT NO. 1—LOCKS AND DAMS.

Excavation—The total excavation during the month amounted to 136,681 cubic yards.

Filling and Embankment—During September, 4,052 cubic yards of dry filling were added to the prism of the west dam at Pedro Miguel, increasing the total amount of material in place at the close of the month to 304,981 cubic yards. The backfill at Pedro Miguel was increased by 29,382 cubic yards, the total in place at the end of the month amounting to 349,500 cubic yards.

At Miraflores, 34,480 cubic yards were added to the dry fill in the toes and 6,409 cubic yards to the hydraulic fill in the core of the west dam, making the totals at the end of the month 977,597 cubic yards and 639,098 cubic yards, respectively, The backfill was increased by 22,480 cubic yards, the total aggregating 203,538 cubic yards at the end of the month.

Pedro Miguel Locks—The general backfilling behind the west wall was continued, as was also the filling in of the middle wall with screenings and sand by means of chamber cranes. The fourth arch at the south end of lock walls was poured during the month. The amount of iron placed in the masonry aggregated 173,132 pounds.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT PEDRO MIGUEL.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)	8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	2.57	3.87
Average number of mixers per day	....	4.20
	Cu. Yds.	*Cu. Yds.*
Average hourly output per mixer (actual working time)	....	31.20
Average amount of concrete and large stone laid per hour, per chamber crane (actual working time)	33.86	....
Large stone laid	....	....
Concrete laid	2,176.00	13 203.00
Total concrete laid	2,176.00	13,203.00

Permanent plant consisted of two chamber cranes, working intermittently.

Auxiliary plant consisted of three 2-cubic yard mixers, and a daily average of 2 76; three ½-cubic yard mixers, daily average 1.64; and five locomotive cranes or derricks, daily average 4.32 units. ½-cubic yard mixers discharged directly into forms.

Concrete Work—The total amount of concrete and large stone laid at Pedro Miguel was 15,379 cubic yards as compared with 20,736 cubic yards during August. The concrete was placed as follows: 1,220 cubic yards in the floors; 109 cubic yards in the southwest wing wall; 293 cubic yards in the northwest wing wall; 3,314 cubic yards in the east wall; 4,182 cubic yards in the west wall; and 6,261 cubic yards in the center wa ll.

Miraflores Locks—The McClintic-Marshall Construction Company advanced the erection of berm crane "E" sufficiently to permit the installation of electrical equipment. Dry excavation was continued in the lower lock, eight steam shovels being employed. The backfilling of the east and west walls and the filling on the east and west toes of the west dam were continued. Work on concrete caisson shells for foundation piers of the upper guide wall was continued. During the month, the amount of iron placed in the masonry aggregated 478,355 pounds.

Concrete Work—The total amount of concrete and large stone laid was 56,083 cubic yards as compared with 57 003 cubic yards during the month of August. The concrete was placed as follows: 4,037 cubic yards in the east wall; 19,238 cubic yards in the west wall; 29,315 cubic yards in the center wall and 3,493 cubic yards in the floors.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT MIRAFLORES.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)	8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	6.30	7.22
Average number of mixers per day	5.32	4.84
	Cu. Yds.	*Cu Yds.*
Average hourly output per mixer (actual working time)	41.05	38.07
Average amount of concrete and large stone laid per hour, per berm, or chamber crane (actual working time)	69.90	....
Large stone laid	....	....
Concrete laid	52,903 00	3,180.00
Total concrete laid	52,903.00	3,180 00

Permanent plant consisted of three berm and two chamber cranes.

Auxiliary plant consisted of two 2-cubic yard mixers daily, and four ½-cubic yard mixers, daily average 2.85. ½-yard mixers discharged directly into forms.

DISTRICT NO. 2—DREDGING.

The following is a statement of the output of the five dredges which were in operation during the month, and of the amount of material excavated hydraulically:

DREDGE.	Type.	WORK.		PLANT.		Total.	Remarks.
		Earth.	Rock.	Earth	Rock.		
		Cu. Yds.	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*	
Cardenas	Dipper	7 883	10,965	6,800	6,800	32 448	Place measurement
Marmot	Ladder	79,538	3,872	7,561	....	90 971	Place measurement

*Excavated from Canal prism, south of Miraflores lock site.

Chamé Sand Excavation—Approximately 40,118 cubic yards of sand were excavated at Punta Chamé and delivered at Balboa.

DISTRICT NO. 3—MUNICIPAL AND SANITARY ENGINEERING.

The reservoirs, water mains, sewers, roads and oil pipe lines were maintained and extended as required to facilitate construction work

DISTRICT NO. 4—ANCON QUARRY.

PERFORMANCE OF ROCK CRUSHER PLANT.

	Hours.
Length of working day (hours)	8.00
Average number of hours per day (actual working time)	7.17
Average number of cubic yards crushed per hour of working day	266.47
Average number of cubic yards crushed per working hour	324.37
Total output for the month, cubic yards	58,290.00

Relocation of Panama Railroad.

During the month 353 210 cubic yards of material were excavated, increasing the total excavation at the close of the month to 8,578,228 cubic yards, and 388,130 cubic yards of material were placed in embankment, increasing the total for this purpose to 14,387,082 cubic yards.

The average daily number of steam shovels at work was 9.44 and the total number of working days was 25.

For comparison with the work done by steam shovels during the preceding month, and during the corresponding month of the previous year, the following table has been prepared:

Period.	Excavated by shovels.	Classification of material.		Av. No. of shovels at work.	W'kg days.	Av. yards per shovel day.
		Rock.	Earth.			
1910:	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*			*C. Y.*
Sept. . .	194,371	111,490	82,881	5.62	25	1,383
1911:						
Aug. . . .	359 363	242,331	117.032	9.41	27	1,415
Sept. . . .	343,770	186,155	157,615	9.44	25	1,457

No temporary trestle was driven during the month. Work on bridges and culverts was continued. No permanent track was laid during the month, the amount of 70-pound and 90-pound track remaining at 134,698 linear feet and 42,043 linear feet respectively, as previously reported. The force averaged 2,172 men, in addition to those employed by contractors.

Quartermaster's Department.

LABOR.

Two hundred and thirty-nine laborers were received during the month, distributed as follows: Central Division, 199; Pacific Division, 40. This practically completed the order for one thousand men, placed with the Recruiting Agent in Barbados in June, and instructions were given to discontinue further shipments.

QUARTERS.

The number of West Indians occupying Commission quarters was increased by 600 during the month, making 1,300 additional men quartered since August 1, 1911.

Accommodations for 250 laborers were prepared at Naos Island. Over 100 laborers are quartered at that point.

The settlement at Bohio has been abandoned and the District Quartermaster instructed to transfer the four American families now at that place to other points.

BUILDINGS.

Work on the Tenth Infantry camp at Las Cascadas and White House was completed at the end of the month. The regiment failed to arrive in September, as originally scheduled. Besides the original work contemplated one additional range closet was erected and a temporary corral put up for the public animals attached to this organization.

MATERIAL AND SUPPLIES.

The value of material received from the United States during the month was $581,348.64. Supplies were delivered by 28 steamers. The total weight of cargo aggregated 29,006 tons, exclusive of 787,634 feet B. M. Douglas fir lumber, 894,853 feet B. M. yellow pine lumber, 70,214 feet B. M. white oak lumber, 165 pieces of piling and 38,440 cross ties. There has been an unusual demand for all classes of lumber and piling during the past three months, due to dock work at Colon and trestle work in the Atlantic and Central Divisions.

Subsistence Department.

The operation of the European laborers' messes, the colored laborers' kitchens and the line hotels showed a net profit of $4,198.78 There was a net profit on hotels, penitentiary, tugs and dredges of $89.72. The operation of the Hotel Tivoli showed a net loss of $1,582.19, which was due to an equipment charge amounting to $2,461.13. September was the first month since November, 1910, that the Tivoli Hotel showed a loss. The net profit on subsistence operations was $2,706.31.

Department of Civil Administration.

COURTS.

During the month 19 civil and 33 criminal cases were disposed of in the Supreme and Circuit Courts, and 69 civil and 585 criminal cases in the District Courts.

DIVISION OF POSTS, CUSTOMS AND REVENUES.

Money order sales for September amounted to $451,199.57, and the fees to $2,038.28. Receipts from stamp and card sales, and newspaper postage aggregated $7,341.23. The total collection of revenues made by the division was $24,690.48, and the collection on account of court fines, costs and fees $2,459 03.

Twenty-six vessels entered at and 25 vessels cleared from the port of Ancon; and 20 vessels entered at and 21 vessels cleared from the port of Cristobal.

DIVISION OF POLICE AND PRISONS.

The total number of persons arrested was 592, of whom 547 were men and 45 women, representing an increase of 44 as compared with the month of August, 31 over July, and 92 compared with the month of September a year ago. Twenty-two nations, or 49 separate states and dependencies, were represented. Seven convicts were committed to the penitentiary, and 16 were discharged, leaving 133 convicts in confinement at the close of the month. The cost of guarding and subsisting the convicts was $2,678.42, and the value of their work on Canal Zone roads $1,815.30.

DIVISION OF FIRE PROTECTION.

Twelve fires were reported in the Canal Zone during the month, as compared with eight in August. The damage to Commission property was $24.50.

DIVISION OF PUBLIC WORKS.

In the city of Panama the average daily consumption of water was 1,316,359 gallons, and in Colon, 957,305 gallons.

The usual inspection and maintenance work of this division was performed during the month.

Department of Sanitation.

The total number of deaths from all causes among employees was 57. These were divided as follows: From disease, 42, and from violence, 15, giving the annual average per thousand of 10.63 and 3.80 respectively.

The annual average death rate per thousand among employees for the month of September in previous years since American occupation was as follows:

1904	14.31
1905	32.00
1906	57.34
1907	28 63
1908	12.78
1909	12.76
1910	11.47

The annual average death rate per thousand in the cities of Panama, Colon and the Canal Zone, including both employees and non-employees, was 21.56.

The annual average death rate per thousand for the month of September among the same class of population for previous years was as follows:

1905	52.31
1906	54 54
1907	32.93
1908	24.91
1909	19.01
1910	21.60

Segregating the whites from the blacks, the annual average death rate per thousand from disease among employes was: For whites, 5.95 and for blacks, 12.24, giving a general average for disease of 10.63. For the same month during 1909, the annual average death rate per thousand from disease among whites was 11.95, and blacks, 8.25, giving a general average of 9.08; and for the same month during 1910, whites, 3.58, and blacks, 9.46, giving a general average of 7.89.

Among employes during the month, the deaths from the principal diseases were as follows: Chronic nephritis, 4; dysentery, clynical, 1; haemoglobinuric fever, 3; lobar pneumonia, 14; tuberculosis, 5; typhoid fever, 1; leaving 14 deaths from all other diseases, and 15 deaths from external violence.

No cases of yellow fever, small pox, or plague originated on or were brought to the Isthmus during the month.

Respectfully,

Geo. W. Goethals, *Chairman.*

Family Quarters.

Applications for married quarters were on file on October 1, as follows:

District.	List No 1.	List No. 2.
Ancon	1	34 (3)
Ancon Hospital	....	6 (2)
Balboa	....	28 (6)
Bas Obispo	....	26 (3)
Corozal	....	38 (1)
Cristobal	6	111
Culebra	....	25 (3)
Empire	1 (1)	63 (33)
Gatun	4	120 (42)
Gorgona	2	74 (33)
Las Cascadas	2	25 (1)
Pedro Miguel	1	47 (12)
Porto Bello	....	9 (7)
Tabernilla	....	1
Toro Point	....	6 (2)
Total	17 (1)	613(148)

Note—The figures in parenthesis show the number of applicants already occupying regular or nonhousekeeping family quarters at stations other than those at which applications are filed.

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Culebra, C. Z., on Sunday, October 22, 1911, at 5.45 p. m.

A concert will be given at Corozal, October 29, at 7.30 p.m.

Sailing of Cristobal.

The sailing date of the steamship *Cristobal* has been changed from 5.00 p. m. Sunday, October 22, 1911 to 5.00 p. m. Saturday, October 21, 1911.

OFFICIAL CIRCULARS.

November 3, a Holiday.

Culebra, C. Z., October 16, 1911.

Circular No. 414:

Friday, November 3, 1911, the anniversary of the Independence of the Republic of Panama, will be observed as a holiday in the Canal Zone, and, as far as possible, all public business will be suspended on that day.

Geo. W. Goethals,
Chairman and Chief Engineer.

Employment of McClintic-Marshall Men.

Culebra, C. Z, October 12, 1911.

Heads of Departments and Divisions:

Ex-employees of the McClintic-Marshall Construction Company should not be employed by the Isthmian Canal Commission or the Panama Railroad Company unless they can show clearances from the McClintic-Marshall Construction Company indicating that there is no objection to their employment on the Isthmus.

Geo. W. Goethals,
Chairman and Chief Engineer.

Acting Chief Quarantine and Health Officers.

Ancon, C. Z. October 10, 1911.

Special Order:

During the absence of Dr. J. C. Perry, Dr. Fleetwood Gruver will act as Chief Quarantine Officer, signing all correspondence as "for and in the absence of Chief Quarantine Officer."

Dr. M. E. Conner in addition to his other duties will act as Health Officer, Panama, signing all papers as "for and in the absence of Health Officer."

By direction of Chief Sanitary Officer.

John L. Phillips,
Assistant Chief Sanitary Officer.

Acting Chief Clerk.

Cristobal, C. Z., October 12, 1911.

During the absence on leave of Mr. Wm. F. Shipley, effective today, Mr. Wm. T. McCormack will act as chief clerk of the Commissary and Subsistence Departments.

Eugene T. Wilson,
Subsistence Officer.

Sale of Public Buildings.

Office of the Chief Quartermaster,
Culebra, C. Z., October 9, 1911.

Sealed proposals for the purchase of any or all of sixty-five (65) buildings located at Bohio, Tabernilla and San Pablo will be received here until 3 p. m., Saturday, October 28, 1911, and then opened. List of buildings and full information will be furnished on application to any District Quartermaster or to this office. Proposals should be accompanied by certified check, post office money order or cash for 5 per cent of amount of bid. Successful bidders will be given the Isthmian Canal Commission freight rate on material contained in buildings purchased. Envelops containing proposals should be endorsed, "Proposals for the purchase of buildings," and addressed to Col. C. A. Devol, Chief Quartermaster, Culebra, C. Z.

Misdirected Letters.

Ancon, C. Z., October 18, 1911.

Supplies for the Canal.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon and Balboa during the week ending October 14:

Clyde, October 8, from New York, with 3 cases insulated tape, for Mechanical Division.

Riverside, October 10, from Hoquiam, Wash., with 23,990 pieces lumber, 2,525 pieces switch ties, 4 pieces spud timber, for stock.

Alcana, October 10, from New York, with 111,868 bags cement for Atlantic and Pacific Divisions.

Metapan, October 12, from New York, with 250 cases ash cans, for stock; 26 pieces rock skips for Atlantic Division.

Cristobal, October 12, from New York, with 132,840 bags cement, for Atlantic and Pacific Divisions.

Atenas, October 12, from New Orleans, with 6,270 pieces lumber, 2,143 bales straw, 454 bales hay, for stock; 1,500 pieces cross arms, for Panama Railroad Company; 99 pieces piling, for Atlantic Division; 6 cases packing, for Mechanical Division; 4 cases school supplies for Department of Civil Administration.

Allianca, October 12, from New York, with 17 crates galvanized pails, 123 kegs bolts and rivets, 15 cases paper tablets, 20 cases black lead, 25 cases machinery, 20 cases rubber hose, 100 cases candles, 100 cases laundry soap, 350 rolls roofing paper, 15 bundles straw board, 17 bundles life-preservers, 7 cases paint, 100 kegs paint, 52 cases castings, 15 packages D. bars, 125 pieces iron pipe, for stock; 8 pieces dredge bucket, 75 pieces wheelbarrows, for Pacific Division; 100 kegs rivets, 10 cases electrical supplies, 25 cases rubber boots, for Atlantic Division; 22 cases metal polish, for Department of Civil Administration; 573 bundles castings, 175 bundles car springs, 158 barrels sand, 6 cases crane parts, for Mechanical Division; and a miscellaneous carge, the whole consisting of 2,307 packages, weighing 252 tons.

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending October 25, 1911 (75th meridian time):

Date.	High.	Low.	High.	Low.
	A.M.	A.M.	P.M.	P.M.
October 19	1.10	7.30	1.45	7.50
October 20	2.10	8.20	2.35	8.40
October 21	2.53	9.05	3.20	9.25
October 22	3.35	9.45	4.00	10.05
October 23	4.10	10.25	4.40	10.45
October 24	4.50	11.05	5.15	11.20
October 25	5.23	11.40	5.50	......

Stages of the Chagres.

Maximum heights of the Chagres River for the week ending midnight, Saturday, October 14, 1911. All heights are in feet above mean sea level.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Joachim* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct, leave on Thursdays at 3 p. m.; ships for New Orleans in the coastwise service on Thursdays at 4 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, OCTOBER 25, 1911. No. 9.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Adress all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Contracts for Lock Operating Materials.

After undergoing tests in the States, at the plant of the manufacturer, the two machines for operating the cylindrical valves of the locks have been approved, and the makers, The Wheeling Mold and Foundry Company, have been awarded the contract for the whole number of machines necessary, 118 in all. During the manufacture some minor changes were made with a resulting economy of six dollars on each machine, the contract cost per machine now being \$875, a total of \$103,250. A contract for 12 auxiliary valve machines has been let to the same manufacturer.

Three bids were received for the copper conductor rail from which the towing locomotives for the locks will collect electric current, and the lowest, that of the Wheeling Mold and Foundry Company, \$166,045.63, has been accepted. The rail will be made by the extrusion process. It will be a modified "T" section with straight sides and a return at the base. A cross section looks like two capital "L's" placed back to back. It will be 2½ inches wide at the base, 3⅛ inch leg, and will weigh 6.07 pounds per foot. It will be made in sections 22½ feet long, and 127,000 linear feet will be required.

The contract for trial motors for the miter gate forcing machines has been let to the Allis-Chalmers Company. If these motors prove satisfactory upon test 42 more may be purchased.

Hydraulic Excavation in Pacific Entrance.

At the southern end of the Miraflores lock pit a barrier of earth separates the pit from the Pacific waters in the channel which has been dredged from Balboa to this point. A mile below this barrier, a cofferdam is being thrown across the channel and when it is completed the water within the lagoon thus formed will be pumped out and the present barrier and the area between it and the new one will be excavated to 45 feet below mean sealevel, with a bottom width of 500 feet. Most of the excavation will be made hydraulically, by the use of the monitors which are now employed in the southern end of the present pit. The new cofferdam, which lies to the south of the central pumping station, will not interfere with its tidal water supply or with the diversion of the Rio Grande. The silt pumped out of the new excavation will be used mostly to fill in the swamp in front of Corozal, extending as far south as Diablo Hill. Watertight fence will be built along the western edge of the swamp, to retain the water pumped in until the sediment deposits.

Work on the new cofferdam has so far advanced that the trestle, which forms its nucleus, will be completed by November 1. The greatest depth of the channel at this point now is 23 feet. Spoil from the northern end of Miraflores pit will then be dumped on both sides of the trestle, to form a dam several feet higher than high tide, with a top width of not less than 30 feet. This will be the last barrier between the locks and the Pacific. When the locks and the channel excavation between them and the cofferdam are completed, water will be let into the space south of the locks and the cofferdam will be removed by dredges.

The Atlantic Entrance.

In the subaqueous excavation of the Atlantic entrance channel, the portion from the initial point (Mile 0) to Mile 2 has been completed. The depth of the channel is 41 feet below mean sealevel, the bottom width is 500 feet and the slope of the sides, 1 on 3. In the remainder, from Mile 2 to Mile 6, the depth at present varies from 40 to 20 feet, decreasing as the channel approaches Mile 5½, which is at Mindi. Between the initial point and Mindi, dredges have removed approximately 23,000,000 cubic yards of soft clay and rock. On account of silting, the net excavation now amounts to some 14,000,000 cubic yards.

The completion of the work of the two 70-ton steamshovels engaged at Mindi, about the first of January, will mark the end of dry excavation in the canal prism in the Atlantic Division. Excavation thereafter in the portion between Mindi and Gatun will be by dredges. The pipeline dredge *Sandpiper* is already making its way from Gatun toward the shovel pit at Mindi, in accordance with this program.

Zone Automobile Fire Apparatus.

Bids will be opened on October 30, at the Washington office for two fully equipped automobile combination fire engine and hose wagons for the Canal Zone Fire Department, one each for Ancon and Cristobal.

They will be of the latest and most approved design, and with material and workmanship of the highest quality. The wheel base will be not less than 144 inches, so constructed as to facilitate turning in a short space and to give proper distribution of the load, and the tread will be not less than 56 inches. The apparatus will have a carrying capacity when fully equipped of not less than 2,500 pounds, and the engine must furnish sufficient power to drive it at a rate of 20 miles per hour up a 12 per cent grade, or 50 miles per hour on level roads, the maximum speed to be set at about 40 miles per hour. The motor, water-cooled, will be not less than 80-horsepower capacity and will have either four or six cylinders, cast in pairs. Two separate and distinct ignition systems will be provided, one of the Bosch high-tension magneto, and the other the Atwater-Kent battery system or its equal. Lubrication and cooling devices will be arranged so as to lubricate and cool the machine in the most approved manner. The fuel capacity will be not less than 20 gallons of gasoline carried in a copper tank equipped with proper feed arrangements.

The apparatus will be equipped with rotary fire pump or a piston pump with a capacity of not less than 700 gallons per minute against a pump pressure of 120 pounds, with all parts so made that they will permit of pumping muddy salt water without corrosion or deterioration. There will be two 4-inch suction connections. The shaftings will be made of chrome nickel steel, hardened and ground, with wide, strong bearings. The pump will be equipped with standard fire-engine pump gauges, air and blow-off valves, an automatic relief or churn valve, and either three or four discharge valves of the quick-opening lever fire-engine type, two to be on one side and one or two on the other.

The hose body of the apparatus will be well-seasoned hardwood, reenforced at the edges and on inner and outer sides, with a capacity of 1,200 feet of 2½-inch cotton, rubber-lined, fire hose. The sides and rear of the apparatus will have steps to carry eight men, and the driver's seat will accommodate two men.

Work of Dredge Badger.

The ladder dredge *Badger*, formerly *No. 14*, which has been excavating in the Pacific entrance channel, is being overhauled at the Balboa shops. When it returns to commission it will be placed on single shift, working while the tide is not too high to prevent its reaching bottom. The *Badger* is an old French dredge, picked up in 1906 and rebuilt. It went into active commission on September 24, 1907. While in the American service it has excavated approximately 4,463,000 cubic yards of earth and rock.

Steamshovel No. 132 in the Borrow Pit at Mount Hope.

During the month of September, Steamshovel No. 132, working in the borrow pit near Mount Hope, excavated 42,600 cubic yards, place measurement, of which 32,400 cubic yards are classified as rock, and 10,200 cubic yards as earth. This material is used in making fills in connection with the new docks at Cristobal, and the site of the new hotel on Colon Beach. The shovel is served

NOTES OF PROGRESS.

(Continued.)

by three trains of about ten 10-yard dump cars each. Delays were as follows: Mining, 3.00; repairs, 0.45; moving shovel, 11.15; cutting out shovel (three times), 3.30; waiting for cars, 5.30; a total of 24 hours. The shovel was under steam 200 hours, and working 88 per cent of that time. The average output per day was 1,704 cubic yards, place measurement.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is about 70.5 per cent completed, 159,207 cubic yards, out of a total of 225,000, having been placed at the close of work on October 21. A statement of the amount laid each working day last week, and of the total in place, follows:

Date.	Concrete Laid.	Hours worked.	No. Mixers.
October 16	116	5.30	1
October 17	36	2.00	1
October 18	100	5.30	1
October 19	116	6.00	1
October 20	69	3.00	1
October 21	128	6.00	1
Total	565	28.00	1
Previously reported	159,207		
Grand total	159,772		

Ancon Crusher.

A statement of rock crushed at the Ancon quarry during the week ending October 21, follows:

Date.	Hours worked.	Cubic Yards.
October 16	7.10	2,690
October 17	7.25	2,989
October 18	7.45	2,285
October 19	5.25	2,549
October 20	7.25	2,686
October 21	8.00	2,811
Total	43.10	16,010

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending October 21, follows:

Date.	Hours worked.	Cubic Yards.
October 16	4.11	1,685
October 17	3.56	1,780
October 18	3.48	1,572
October 19	4.37	2,122
October 20	3.33	1,625
October 21	3.27	1,468
Total	23.32	10,252

Visit of Senators.

Among the passengers on the *Ancon*, which arrived at Cristobal on October 21, were the following United States Senators and their friends: Senators Frank B. Brandegee, New London, Conn.; Carroll S. Page, Hyde Park, Vermont; John Randolph Thornton, Alexandria, La.; Joseph L. Bristow, Salina, Kansas; Members Committee on Interoceanic Canals; Lee S. Overman, Salisbury, N. C.; George P. Wetmore, Newport, R. I.; Albert B. Cummins, Des Moines, Iowa; Representative Edwin W. Higgins, Norwich, Conn.; Col. Daniel M. Ransdell, Sergeant at Arms, United States Senate; Mrs. M. G. Zalinski, N. Y.; Mrs. Albert B. Cummins, Des Moines; Mrs. Edwin W. Higgins, Norwich, Conn.; Miss Charlotte B. Ransdell, Washington; Mrs. Arthur B. Grover, Indianapolis; Mrs. Alexander H. Galt, Washington; Mrs. Cleo C. Hardy, Salina, Kansas; the Hon. Michael Kenealy, Stamford, Conn.; Mr. Russel S. Page, Hyde Park, Vermont; Mr. Rogers Wetmore, Newport, R. I.; Mr. Alexander H. Galt, Secretary to Senator Page; Mr. John D. Brown, Secretary to Senator Overman; Mr. Cleo C. Hardy, Secretary to Senator Bristow; Mr. William Gardiner, Assistant Clerk to Committee; Mr. W. T. Chapman, Stenographer to Committee.

The *Ancon* will sail for New York at noon on Tuesday, October 31.

CONCRETE WORK IN THE LOCKS.

Over 68 per cent of the concrete for the locks is in place, the amount at the close of work on October 21, being 2,893,785.5 cubic yards, out of a total of approximately 4,199,400. A total of 33,861.5 cubic yards of concrete was laid in the locks during the week ending October 21.

GATUN LOCKS.

Over 83 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on October 21 being 1,660,999.5 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending October 21, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers.			Large stone.	Total.

Death from Bubonic Plague.

Herman T. Bolton died at Ancon Hospital on October 17 from bubonic plague. He was born in Germany 35 years ago and had worked for the Canal Commission as a mechanic, and as a building contractor. He left the Isthmus in July, 1911, and went to Colombia and later to Ecuador. He left Ecuador on October 7 on the *Chile* and arrived at the quarantine station in the Bay of Panama on October 11. He entered Ancon hospital on October 13, and died on October 17. The Department of Sanitation makes this statement in regard to the case:

"The case was not recognized as plague until it was discovered to be so on examination at the autopsy, the symptoms presented not being those of plague.

"The danger from a case of this kind is, that fleas at some point where the victim had been may have become infected, and thus pass the disease on to other human beings. To protect against this risk, every place at which the patient had been was disinfected with the expectation of killing all fleas. All persons who had been about the patient were detained over the quarantine period of six days after they had been in contact. The patient left the Quarantine Station on October 13, and as the period of infection is seven days it is believed that anybody exposed at that time has passed the period for the development of the disease; and as he died on the 17th, it is equally probable that anybody exposed in the hospital has passed the infectious period. There is no possibility, therefore, of the disease spreading from this case."

LABOR FORCE AND QUARTERS IN SEPTEMBER.

The total force at work on the Canal and railroad on September 27 was 37,315, as compared with 35,648 at the end of August, 1911; with 35,369 in September 1910, and 35,210 in September 1909. Canal employes numbered 29,623 and railroad employes 7,692. The number of "gold," or white American employes, was 4,112, compared with 4,141 in August, 1911, and with 4,459 in September, 1910. The force report for September 27, follows:

QUARTERS.

On October 1, there were 24,493 occupants of Commission quarters. Of these, 9,134 were white Americans, of whom 5,122 were men, 2,052 were women, and 1,960 were children. There were 5,639 Europeans of the laborer class, of whom 5,044 were men, 246 women, and 349 children. There were 9,720 West Indian negroes, of whom 7,251 were men, 1,107 women, and 1,362 children. Included in the above were 32 Asiatics, 126 East Indians and 117 Panamans.

The Peruvian bark *Lena* sailed from Punta Arenas, Costa Rica, on October 14 for Balboa with a cargo of between 600 and 700 tons of cocobolo wood for transshipment to New York. This will be the first time that an entire shipload of this wood has gone to the States from Central America, previous shipments having been made by jobbers in smaller lots. The firm which bought and shipped this cargo is that of H. Mann & Co., of New York.

DIET FOR THE TROPICS.

Report of Board Approves Present Diet Offered By Commissary.

The board of physicians convened by the Chief Sanitary Officer under directions from the Chairman, to report as to whether the ration furnished the Commission employes is suitable for their requirements, has submitted its report. The board consisted of Lieut. Col. Chas. F. Mason, Superintendent of Ancon Hospital; Dr. Wm. H. Bell, Superintendent of Colon Hospital; Dr. Samuel T. Darling, Chief of Board of Health Laboratory, and Dr B. W. Caldwell, Superintendent of Santo Tomas Hospital, Panama.

Access was given to all such records as the board should care to consult, and it was authorized to call any witnesses it might desire.

Special attention was given to the testimony of Dr. W E. Deeks, of Ancon Hospital, who maintained that retarded tissue metabolism in tropical countries invalidates dietary rules based on experience in the temperate zone and, particularly, that the food furnished the employes contains too great a proportion of sugar and starch and not enough of green vegetables and fruit. To this Dr. Deeks attributed many cases of stomach and liver disease. He added that fruit juices and the alkaline salts of vegetables facilitate digestive metabolism. In a corollary to its report the board expresses an opinion that the commissary stores should keep on sale at all times such fruits and green vegetables as practicable, "not that an increased supply of these articles is necessary to the health of the employes, but that it would afford variety and contribute to their contentment." In the report proper, the Board came to its conclusions as follows:

"After careful consideration of the letters of the Chairman and the order of the Chief Sanitary Officer convening the Board, it is our understanding that the following are the points to be determined; First—What constitutes a well balanced ration for service in the Tropics? Second—Is such a ration furnished by the Commissary Department? Third—Could any lessening of the sick rate among Isthmian Canal Commission and Panama Railroad employes be effected by a different ration? Fourth—What is the best *diet* for employes on the Isthmus?

1. The Board finds that a great deal of work has been done in the tropics all over the world with a view of determining what is the best ration for a white man in the tropics, and as a result of these labors the following tables, taken from Munson's "Hygiene," may be taken as standard.

Table 1 for white men weighing about one hundred and fifty (150) pounds, at hard labor—

Protein..................	76.18	grams.
Fats.....................	40.00	grams.
Carbohydrates...........	560.00	grams.
Calories.................	2,900.00	grams.

Proportion of carbohydrates to protein, 7½ to 1.

For soldiers under the same circumstances—

Protein..................	100.	grams.
Fats.....................	65.	grams.
Carbohydrates...........	650.	grams.
Calories.................	3,481.	grams.

Proportion of carbohydrates to protein, 6⅔ to 1.

2. In the sense that the ration is a definite quantity of certain articles of food per man, per day, there is no ration furnished by the Commissary Department, the unit of measure being money value and not quantity. But from the figures furnished by the Subsistence Officer, and numerous inquiries and personal investigations made by the members of the Board, we find that the food furnished to the hotels, messes, kitchens, and employes living elsewhere,

is of such quantity, quality and variety as to more than meet the needs of the highest of the above standards and to enable any employe to select such articles of food as the nature of his employment and the amount of exercise he takes may render best for him. Moreover, there is no evidence from the records of Ancon, Colon, and Santo Tomas hospitals, and elsewhere, that the ration furnished the Commission employes is not a well balanced one.

3. The food supplied by the Commissary having been shown to meet the requirements of the best tropical standards, it is our opinion that no lessening of the sick rate could be effected by a different ration. As regards the question of *diet*, however, indiscretions and errors are certainly not more frequent here than in any other part of the world, though there is no doubt that there is some sickness which could be prevented could people be taught to exercise discretion and intelligence in the selection of the food they eat.

4. As the determination of the question of what is the best diet depends upon so many factors, such as age, sex, race, habits, occupation, etc., no directions that we could give would be of any value except in the most general way. The consensus of opinion of the best authorities is that, other conditions being equal, more sugars and starches, and less proteids, should be consumed in the tropics than in colder climates, but the particular diet which is best for any individual should be a matter for determination by his own physician.

Chas. F. Mason, Wm. H. Bell, Samuel T. Darling, B. W. Caldwell.

Villages to Be Abandoned.

Inasmuch as the portion of the Panama railroad between Gatun and Gorgona is to be torn up after the first of February, 1912, on account of the filling of the Gatun Lake area up to 85 feet above sea level, leaving the villages along the present railroad in that section in isolation, the removal of inhabitants is being hastened. Licenses for stores and shops in this area are not issued as of effect after December 31, 1911. Claims are being adujsted and in such cases as necessary the inhabitants will be assisted in their moving.

Villages and settlements which will be inundated by Gatun Lake when the level has reached 85 feet above mean tide are: Lion Hill, Ahorca Lagarto, Bohio, Penas Blancas, Frijoles, Tabernilla, San Pablo, West San Pablo, Bailamonos, Mamei, Juan Grande, Gorgona (partly), Matachin, Bas Obispo (partly), Auguas Claras, Guarapo, Montevistoso, Monte Lirio, and Limon. A new village of Monte Lirio is being built on the relocated Panama railroad. Other new villages on it at present are New Frijoles and Gamboa.

Half a dozen of the present villages will be abandoned from causes other than flooding. They are Miraflores and Pedro Miguel, on account of construction connected with locks, and Mandingo Llano, Rio Grande, Cucaracha, New Culebra and Spanishtown, the existence of which is not regarded as worth the cost of their sanitary maintenance.

Some of the material from the hydraulic excavation at Miraflores is being used to make a fill southwest of the lower lock site on the east side of the Rio Grande, between Riley's spur of the Pacific Division and the Central Division tracks from Bridge 61½ to the bridge crossing the Cardenas River. The fill will raise the surface of the swamp 5 or 6 feet.

SPILLWAY GATE MACHINES.

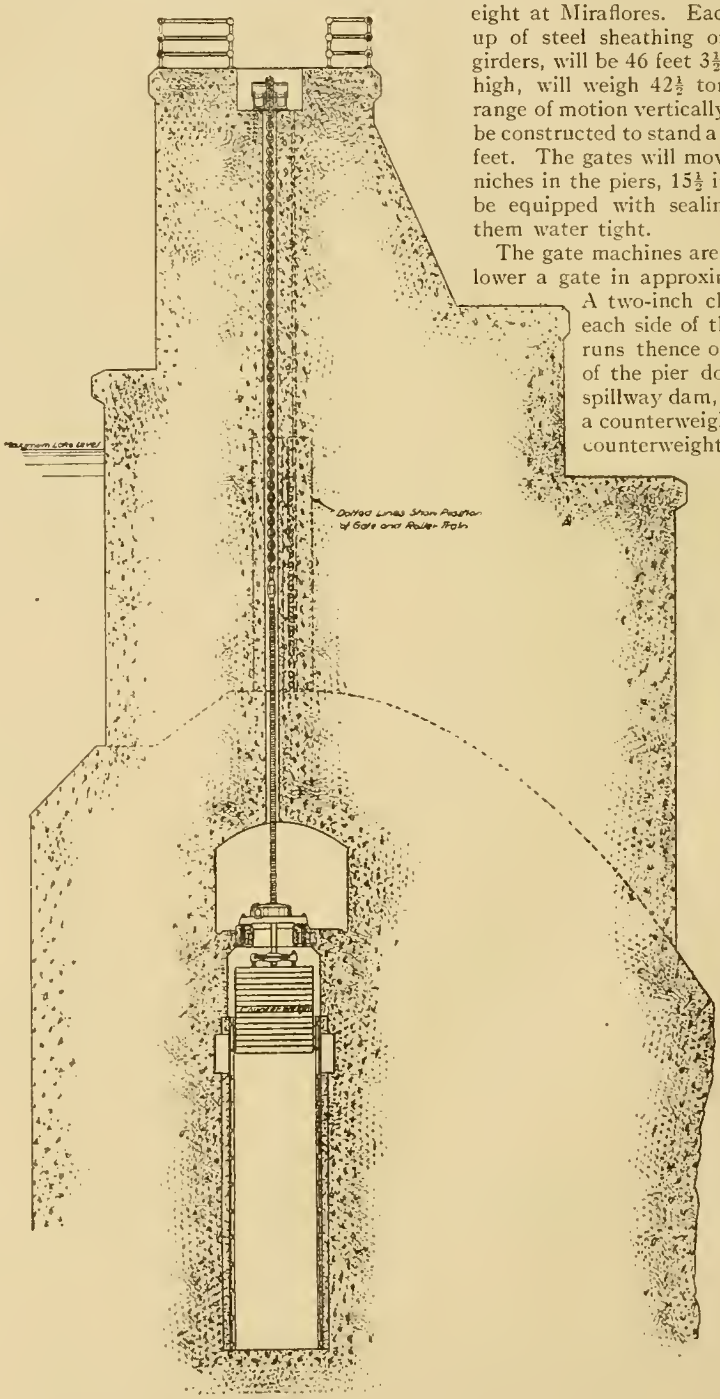
Method of Raising and Lowering Gates to Regulate Water in Lakes.

Each of the twenty-two gates in the spillways at Gatun and Miraflores dams will be operated by a machine erected in a tunnel extending the full length of the spillway dam. Bids for these machines (22 in all) are about to be advertised for in the United States. An article describing the gates was published in The Canal Record of July 12, 1911. The drawings reproduced herewith show the method of operating the gates and the arrangement of the machinery at Gatun spillway, and the principle is the same for the spillway at Miraflores.

The purpose of the spillway and regulating gates at Gatun is to form a means of keeping the level of the lake at approximately 85 feet above mean tide, by affording a method of allowing the flood water of the Chagres valley to escape without flowing over the dam. To this end a concrete lined channel 285 feet wide has been made through the center of the dam, and across it a concrete dam is being constructed to a height of 69 feet above sea level. Its crest is on the arc of a circle and it is 808 feet long, although it closes a channel only 280 feet wide. (At Miraflores the dam is straight and is 432 feet long). Between concrete piers rising from the top of this dam with their tops at 115.5 feet above sea level will be mounted the regulating gates of the sluice or Stoney type. Each will close an opening between piers 45 feet wide. There will be fourteen on the Gatun spillway dam and eight at Miraflores. Each gate will be built up of steel sheathing on a framework of girders, will be 46 feet 3½ inches long, 19 feet high, will weigh 42½ tons complete, have a range of motion vertically of 22½ feet, and will be constructed to stand a maximum head of 18 feet. The gates will move on roller trains in niches in the piers, 15½ inches deep, and will be equipped with sealing devices to make them water tight.

The gate machines are designed to raise or lower a gate in approximately ten minutes. A two-inch chain is attached to each side of the top of a gate, and runs thence over a sheave on top of the pier down into a pit in the spillway dam, in which there hangs a counterweight of cast iron. The counterweights on a set of two chains practically balance the weight of the gate, so that the machines need only to overcome the frictional resistance. The counterweights are guided, and travel in pits beneath the floor of the machinery tunnel. Each weight is connected with the chain by a bronze screw which is driven vertically by a worm wheel nut—motor driven by a worm—the resulting movement being to raise or lower the gate.

The machinery tunnel extends the full length of the spillway, within the dam, and contains all the operating machinery. The screws for lifting the gates pass through this tunnel, extending downward to the counterweights and upward to the hoisting chain through openings provided for the purpose. The machinery, located in the tunnel, consists

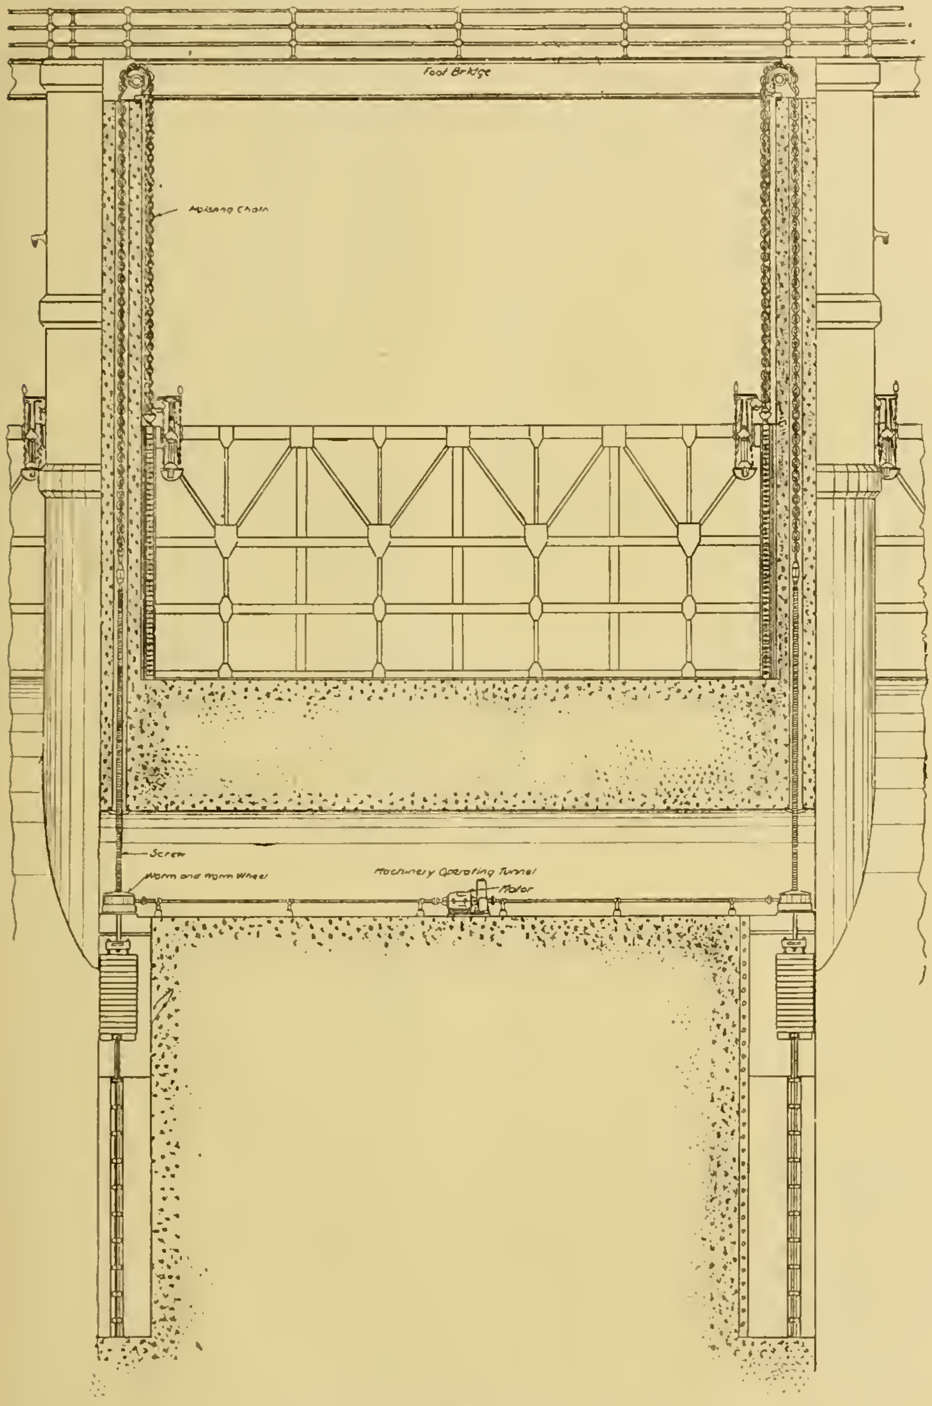


Sectional elevation through counterweight pit and chain pipe showing chain, screw, machinery tunnel, worm nut, counterweight and counterweight pit.

of the worm nuts, worm wheel castings, motor driven shaft, and limit switch. The worm wheel casing is anchored by foundation bolts to the counterweight pit cover, at the level of the machinery tunnel floor, and takes the thrust of the worm nut through roller bearings.

The motor is located on a bed plate about midway between screws and is coupled directly to the driving shaft. The driving shaft carries a worm at each end which engages the worm nut. The driving shaft is supported by six adjustable shaft bearings.

The 2-inch hoisting chain is connected to the upper end of the lifting screw, passing through a pipe to the top of the gate pier, runs over a sheave and down to the gate where it is fastened approximately in the plane of the center of gravity of the gate.



PLAN SHOWING WITH RELATION TO ONE ANOTHER STONEY GATE, HOISTING CHAIN, SCREW, WORM AND WORM WHEEL, COUNTERWEIGHT AND PIT.

The ¾-inch roller train chain is fastened at its upper end to the 2-inch chain sheave bearing and is fastened, after passing over five sheaves, to a bracket which is fastened to the gate. One sheave is fastened to the roller-train, two to the bracket, and the other two sheaves are normally held by the bracket but are movable. The sheaves on the bracket move with the gate until the gate is above water, where the movable sheaves are engaged by a casting projecting from the pier, thus causing the roller train to rise more rapidly. When the gate reaches the end of lift the roller train is well clear of the water, thus protecting it from floating debris. Just before the roller train starts to move more rapidly than normal the gate is moved bodily upstream a short distance by two rollers near the ends, so that the pressure is removed from the roller trains, enabling them to move freely.

The limit switch, geared to the driving shaft, prevents over-travel at the two ends of travel of the screw, by cutting off current from the motor in the direction of travel. The limit switch allows the motor to be reversed at the ends of travel or at any intermediate point. A portable hand operating device is provided which is clamped to the driving shaft when in use and operated by two cranks for emergency purposes.

Seepage water will be allowed to accumulate in the counterweight pits, ordinarily, and these pits will be freed from water by portable pumping outfits, of which three will be purchased. Each outfit will consist of a vertical centrifugal pump of 45 gallons a minute capacity against a 32-foot head, driven by a vertical induction type motor, the two rigidly connected and forming a unit, which will be waterproof so that the motor can operate under water up to a 30-foot head. Eye bolts or rings in the upper side of the casing will afford a means of lowering the outfit into the pits.

Washington Hotel Reopened.

The Washington Hotel in Colon, having been moved from the site upon which the new hotel is to be erected, to an adjacent site, has been reopened for transient and regular trade. The interior has been completely refinished. Regular meals are served from 4.30 to 8 a. m., 11 a. m. to 1 p. m., 5 to 7.30 p. m. on working days, and on Sundays and holidays, from 5 to 8 a. m., 11.30 a. m. to 1.30 p. m., 5.30 to 7.30 p. m. A special service by the card is maintained throughout the day and until 9 o'clock at night. Rooms may be procured at any time of the day or night.

CLASSIFIED EXPENDITURES.

A statement of classified expenditures of the Isthmian Canal Commission to August 31, follows:

Periods.	Department of Civil Administration	Department of Law	Department of Sanitation.	Department of Construction and Engineering	General Items.	Fortifications.	Total.
To June 30, 1909	3,427,090.29	....	9,673,539.28	69,622,561.42	78,022,606.10	....	160,745,797.09
Fiscal year, 1910	709,351.37	....	1,803,040.95	26,300,167.05	2,863,088.83	....	31,675,648.20

Total	5,039,184.77	4,405.62	13,488,963.47	127,753,275.10	84,675,759.86	86,243.14	231,047,831.96

PERSONAL.

Among the passengers on the *Ancon*, which arrived at Cristobal on October 21, were Mr. W. G. Comber returning from annual leave of absence; Capt. Mark Brooke, U. S. A., who represented the United States in the transfer of French canal properties on the Isthmus on May 4, 1904, with Mrs. Brooke, and Maj. S. D. Butler, U. S. M. C., with Mrs. Butler and children.

Mr. Edward Schildhauer, accompanied by Mrs. Schildhauer, returned from the States on the *Colon*, which arrived at Cristobal on October 18.

Missionary Society.

The Ladies Missionary Society of Empire Christian League held a meeting at the home of Mrs. E. P. Beck on Friday, October 20, when the members of the Missionary Society of the Methodist Church, Panama, were the guests. There were 46 present. Following the business session, there was a program consisting of songs by Mrs. E. M. Keyser and papers read by Mrs. H. A. Smith, Mrs. Fuller and Mrs. Fearon. The lesson on missionary work in Porto Rico was conducted by Mrs. A. A. Nellis. On Friday evening, November 17, the society will hold an entertainment in the Commission chapel the proceeds of which will be used for mission work in the Canal Zone.

Red Cross Finances.

A financial statement of the Canal Zone Chapter, American National Red Cross, for the month of September, follows:

RECEIPTS.

September 1, On hand.........	$3,079.14	
September 6, Proceeds of ball at Gatun for the Endowment Fund..	84.63	
Total receipts..........................		$3,163.77

DISBURSEMENTS.

September 6..For deportation of West Indian in Colon Hospital to St. Lucia...........$	40.00	
September 8..To Treasurer, National Red Cross, Washington, total amount of Endowment Fund......	709.63

September 23..Loaned to American against his vacation pay........	161.00	
September 23..Relief of destitute American negress	25.00	
September 25..Relief of negro woman. Colon fire sufferer...........	10.00	
September 29..Deportation of disabled ex-employee to Trinidad.....	20.00	
Total Disbursements..........		$1,138.63
October 1..Balance on hand......		$2,025.14

JOHN L. PHILLIPS, *Treasurer*.

Approved:
WM. L. SIBERT, *Acting Chairman*.

Postal Business and Canal Zone Revenues.

During the month of September there were 19,408 money orders issued, amounting to $451,216.02. Of this amount, $340,976.03 was issued payable in the United States, $109,328.56 in the Canal Zone, $779.50 in Martinique, and $131.90 in Costa Rica. The fees amounted to $2,039.30, and the amount of orders paid and repaid was $131,009.41.

Postal sales during the month amounted to $7,339.00, and newspaper postage to $2.23.

The revenue collections for the month were as follows:

Bicycle and chauffeur licenses,..$	41.00
Insurance collections, annual fees	50.00
Motor vehicle licenses..........	63.00
Taxes, licenses, etc............	15,247.67
Miscellaneous collections.......	3.18
Total.........................	$15,404.85

Sale of Canal Buildings.

The sale of buildings in the canal villages of Bohio, Tabernilla, and San Pablo, advertised below, is made because the work is almost completed in the lake region and also because the villages will be isolated after the present railroad is torn up during the approaching dry season on account of the impending rise of the water in the lake, due to the construction of the spillway dam at Gatun to elevation 50 feet above sea level. A previous sale advertised resulted in no satisfactory bid for the whole number of buildings to be sold at that time being received. The Quartermaster's Department then placed a minimum price on each building the total being about twice that of the highest bid received. Already enough buildings have been purchased under this arrangement to aggregate more than the original high bid. The buildings contain good lumber, which is expensive on the Isthmus, and they are used principally in building houses along the relocation of the Panama railroad.

Missing Men.

Any one having information regarding the whereabouts of Joseph H. Golding, who is supposed to be on the Isthmus of Panama, is requested to communicate with the American Legation, Panama.

Any one having information regarding the whereabouts of Tim Silberman, at one time living in El Paso, Texas, and who is now supposed to be on the Isthmus of Panama, is requested to communicate with THE CANAL RECORD.

The steamship *Stanley Dollar*, from San Francisco, now in the bay, awaiting a berth at the Balboa docks, encountered such heavy weather while in the Gulf of California that a part of the deck cargo had to be jettisoned. Twenty thousand feet of lumber, consigned to dealers in Panama, was thrown overboard.

Sale of Public Buildings.

OFFICE OF THE CHIEF QUARTERMASTER,
CULEBRA, C. Z., October 9, 1911.

Scaled proposals for the purchase of any or all of sixty-five (65) buildings located at Bohio, Tabernilla and San Pablo will be received here until 3 p. m., Saturday, October 28, 1911, and then opened. List of buildings and full information will be furnished on application to any District Quartermaster or to this office. Proposals should be accompanied by certified check, post office money order or cash for 5 per cent of amount of bid. Successful bidders will be given the Isthmian Canal Commission freight rate on material contained in buildings purchased. Envelops containing proposals should be endorsed, "Proposals for the purchase of buildings," and addressed to Col. C. A. DEVOL, Chief Quartermaster, Culebra, C. Z.

Tug Service to Porto Bello, Nombre de Dios, and Toro Point.

Effective June 26, the following schedule will be maintained between Dock 13, Cristobal, Nombre de Dios, Porto Bello, and Toro Point:

Tug *Reliance* will leave Dock 13 daily, except Sundays, at 7 a. m., with two barges for Nombre de Dios, returning at once with two bargesto Gatun.

Tug *Mariner* will leave Dock 13 daily, except Sundays, at 9 a. m., with three barges for Porto Bello, returning to Gatun as soon as barges are loaded.

Tug *Porto Bello* will leave Dock 13 Saturdays at 9 a. m., light, for Porto Bello. This tug will leave Porto Bello, light, at 2 p. m., arriving at Dock 4, Colon, in time for passengers to catch train No. 7, leaving Colon at 4.35

Tug *Porto Bello* will leave Dock 13 Sundays at 7 p. m., for Porto Bello, returning at once.

Tug *Mariner* will leave Dock 13 daily, except Sundays, at 6.30 a. m., for Toro Point, returning at once.

Tug *Mariner* will leave Dock 13 Sundays at 9.30 a. m., for Toro Point, returning at once

A tug will leave Dock 13 on Wednesdays, Saturdays, and Sundays, at 4.30 p. m., for Toro Point, returning at 5.30 p. m.

A tug will leave Dock 13 on the 20th of each month at 6 a. m., for Porto Bello and Nombre de Dios, returning to arrive at Dock 4, Colon, about 4.30 p. m.

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Corozal, C. Z., Sunday, October 29, 1911, at 7.30 p. m. The program follows:

1. March—*Happy Days*......................Levi
2. Selection—*The Pink Lady*................Caryl
3. Reverie—*Silent Thought*..............Morrison
4. Overture—*Jolly Robbers*.................Suppe
5. (*a*) Two Step—*Billy*....................Kendis
   (*b*) —*Chicken Reel*.........................Daly
6. Excerpts from Faust...................Gounod

Arrivals—October 16, *San Juan*, from San Francisco; October 16, *Mantaro*, from Callao; October 16, *Guatemala*, from Callao; October 16, *Aztec*, from San Francisco; October 20, *Kansas City*, from San Francisco.

Departures—October 17, *Pachitea*, to Callao; October 17, *Quito*, to Guayaquil; October 18, *Leggett*, to San Francisco; October 18, *Manga Reva*, to San Francisco; October 18, *Chile*, to Guayaquil; October 19, *Pennsylvania*, to San Francisco; October 21, *Palena* to Valparaiso.

OFFICIAL CIRCULARS.

Old Laborers To Be Retained.

CULEBRA C. Z., October 16, 1911.

MEMORANDUM FOR THE ACTING CHIEF QUARTERMASTER:

The following is quoted from a report submitted by the office of the Secretary to the Commission:

"There have been several Spanish laborers in this office of late who were discharged by the Quartermaster's Department at Balboa. They claimed that about 10 Spaniards were discharged on account of "reduction of force" in one week from September 20, to 28, and that 13-cent West Indian laborers were taken on in their place.

* * * * * * * * * * * * * * * * *

I do not consider that it is good policy at this time to substitute West Indians for Europeans. If this is being done in the Quartermaster's Department, please issue orders to stop it.

I am also advised that work was found recently for a small gang of new arrivals from Spain, and that speakers at the laborers' meeting at Las Cascadas yesterday referred to this and complained bitterly that men who have served for years were being laid off to make room for these new arrivals. There is justice in this complaint, and I do not want any more new men employed while we are discharging laborers with satisfactory records on account of reduction in force.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Acting Superintendent, Mechanical Division.

CULEBRA, C. Z., October 16, 1911.

CIRCULAR No. 415:

Effective October 17, 1911, Mr. J. J. Eason will act as Superintendent of the Mechanical Division during the absence of Mr. A. L. Robinson, on leave.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Surcharge for U. S. Army.

CULEBRA, C. Z, October 20, 1911.

CIRCULAR No. 169-K:

Effective this date, the same surcharge will apply on material and labor furnished detachments of the United States Army stationed on the Canal Zone as on material and labor furnished the Government of the Canal Zone.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Gatun-Culebra Labor Train Transportation.

CULEBRA, C. Z., October 20, 1911.

CIRCULAR No. 416:

On and after November 1, 1911, no cash fares are to be accepted on the Gatun-Culebra labor train.

Twenty-trip tickets, one dollar each, have been provided for those persons authorized to use this train, and will be on sale at the office of the Division Engineer at Gatun, beginning October 20, 1911. These tickets will be accepted on the train at any time thereafter.

The pads of tickets must be presented to the conductor, who will detach tickets for the trip.

Only those who are authorized by the Chairman and Chief Engineer, or the Division Engineer of the Atlantic Division, shall be permitted to use this train.

All employes of the Atlantic Division are required to obtain their tickets from the office of the Division Engineer at Gatun. Any other persons authorized to use this train can secure twenty-trip tickets from the Conductor.

Single trip tickets of five cents each will be sold at the office of the Division Engineer at Gatun only in special cases.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Quarantine Period in Plague Cases.

ANCON, C. Z. October 21, 1911.

TO ALL CONCERNED:

The Chief Sanitary Officer directs that in future the Quarantine period for passengers and members of the crew of all vessels coming to the port of Balboa or Colon from plague infected ports, be extended from six to seven full days from the hour of leaving the infected port.

In case a plague suspect is taken from the vessel at Quarantine on reaching the Isthmus, or dies while the vessel is en route to the Isthmus, the full seven day period shall be reckoned from the removal of the passengers and the disinfection of the ship at the Quarantine Station, where suspects should be isolated, the contacts segregated to themselves, and the other passengers segregated as far as possible in groups.

Passengers being held in Quarantine, when ill from any cause at the time of landing, or who develop illness irrespective of the cause, while being held at the Quarantine Station, must be at once isolated, given special attendance, and not discharged from Quarantine until authorized by the Chief Quarantine Officer, to whom all cases should be reported on the first symptoms of illness.

In the absence of the Chief Quarantine Officer from the Isthmus at any time, information relative to infected ships, suspects, and cases of illness of detained passengers coming from infected ports, shall be reported promptly to this office, first by telephone, to be followed by letter.

JOHN L. PHILLIPS,
Assistant Chief Sanitary Officer.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The schedule of moving picture entertainments for the week of October 30 to November 4, is as follows: Monday, Gorgona; Tuesday, Gatun; Wednesday, Cristobal; Thursday, Culebra; Friday, Empire; Saturday, Corozal.

Mengel	145	178	224	O'Sullivan	142	112	146
Herrington	170	128		Weight	180	151	141
Driscoll	177	150	159	Clouse	196	154	151
Case	184	157	164	Swartz	150	182	157
Dougherty	235	212	180	Austin	137	137	124
Cushing			157				
Total	910	825	884		805	736	719

CULEBRA AT CAMP ELLIOTT.

Mitchell	146	159	185	McDonald	150	142	118
Brown	112	136	103	Jauke	145	151	
Sjoblum	129	127	117	Estelle	138	155	105
Baumer	131	135	171	Krouth	171	137	126
Fay	127	154	100	Martin	167	183	157
				Calalds			138
Total	645	711	676		771	768	644

Saturday night, October 21.

Culebra.				Gorgona.			
Herrington	160	144	139	Arnold	144	157	157
Warner	147	142	169	Sims	157	158	155
Driscoll	151	171	171	Wurderman	137	118	143
Case	191	168	194	Orr	152	168	176
Dougherty	176	189	136	Roper	180	153	151
Total	825	814	805		772	754	782

High scores made during the week were as follows: Big Pins—Dougherty 235, 212; Mengal, 224; Case, 203, 200; Warner, 208. Duckpins—Bartlett, 115, 109; Hobart, 107, 101; Palmer, 103; McIlvaine, 100; Fox 107.

There will be a concert at the clubhouse on Sunday, October 29.

EMPIRE.

The following high scores were bowled on the alleys during the past week: Ten Pins—Parkis, 253; Pinney, 203, 204, 208, 203; Rode ghiro, 217; Spinks 204; Gustaveson, 222; Huson, 216. Duckpins—Dakin, 105; Pinney, 100; Grund, 102; Payne, 101.

Empire took three games from the Camp Elliott team in the league series on Saturday October 21, on the Empire alleys, the scores were as follows:

Empire.				Camp Elliott.			
Gustaveson	168	171	209	Egult	126	178	152
Spinks	170	145	174	Kritel	132	148	146
Gorham	188	119	177	McDowel	174	159	133
Pearson	185	168	198	Janke	142	124	153
Huson	167	181	172	Catalde	148	132	108
Total	878	784	930		722	746	692

On the Camp Elliott alleys Saturday, October 21, Camp Elliott took three games from Empire.

At the meeting of the literary society held on Friday, October 20 the debate "Resolved, that women should be given the right of suffrage" was won by the negative. The next meeting will be held on Friday, October 27.

GORGONA.

The gymnasium pictures have arrived, and are on sale at the desk. Those who placed orders for these pictures should call for them as promptly as possible.

At the monthly song service on Sunday evening, October 22, a short program was rendered by the Arion Trio, followed by a talk by C. H. Elliott of Colon, after which the regular song service was held.

GATUN.

Gatun won all three games of bowling from Cristobal at Gatun on Saturday evening, October 21. Gatun also won two games at Cristobal.

Gatun defeated Corozal in the match game of basket ball on Saturday evening, October 31. The score was 16 to 5. Mr. W. H. Warr of Empire acted as refreee.

A club for the discussion of social reform questions is being organized at the clubhouse.

The following bowlers have rolled 100 or over during the first half of October, in all 36 games: Delano, 1; Teall, 6; Claherty, 3; Bailey, 2; Ruch, 2; Vierbuchen, 4; Wells, 3; Doyle, 2; Carter, 1; Gayer, 1; Wurster, 4; Green, 2; Barte, 5. Eight men rolled 200 or over in ten pins during the first half of October: Beattie, 1; Myers, 1; Chamberlain, 1; Galloway, 1; Hodges, 2; Severn, 4; DeMoll, 1; Barte, 4. DeMoll and Hodges lead in the ten pin ragtime tournament, score, 1,100. Green and Wurster lead in the ten pin ragtime, score, 573. Galloway's game of 225 in ten pins and Barte's game of 124 in duckpins are the highest so far for October.

The standing of the leaders in the pool tournament up to October 21, was as follows:

Name.	Won.	Lost.	P. C.
Bailey	3	0	1.000
Jones	2	0	1.000
Shiler	2	0	1.000
Young	1	0	1.000
Hughes	1	0	1.000
McKay	3	1	.750

The billiard tournament will begin on Thursday night with ten players.

CRISTOBAL.

There was an attendance of 53 at the Literary and Debating Club on Wednesday evening, October 18. The subject of "Disarmament" was discussed. Decision was in favor of the negative.

The basketball team won the game played with the Culebra team on the local floor Saturday evening, October 21, by a score of 23 to 7. The Cristobal team thus takes first place in the Isthmian Basket Ball League.

The Gatun bowling team took two games out of three from the Cristobal team on the local alleys on Saturday evening, October 21.

The scores were as follows:

Gatun.				Cristobal.			
Dickson	158	171	169	Gibson	168	148	155
Myers	178	170	108	Blackburn	145	159	151
Durand	205	172	203	Collins	166	145	173
Beattie	162	171	168	Bullard	182	168	198
DeMoll	175	150	160	Louch	177	160	183
Total	878	835	808		838	780	860

At the next moving picture entertainment Messrs. Glick and Weston will entertain the audience during change of films.

The regular session of the Debating Club, scheduled for November 1, has been postponed until November 8 at which time an adress will be delivered on "Abraham Lincoln," by Mr. W. F. Morrison.

Supplies for the Canal.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon and Balboa, during the week ending October 21:

Mackinaw, October 14, from San Francisco, with 1,090 pieces redwood lumber, for Mechanical Division.

Colon, October 18, from New York, with 156 barrels clay, 140 drums calcium carbide, for Mechanical Division; 59 kegs bolts, for Pacific Division; 141 kegs bolts, 6 cases wire cloth, 36 crates locomotive crane, for Atlantic Division; 21 cases castings, 35 barrels rosin, 12 cases hose, 30 barrels sea coal facing, 10 cases blasting batteries, 20 reels wire rope, 22 drums oil, 50 kegs wire nails, 83 bundles iron pipe, 122 pieces iron pipe, 25 cases paper napkins, for stock; 30 cases drugs, and sundries, for Sanitary Department; and a miscellaneous cargo, the whole consisting of 1,417 packages, weighing 265 tons.

Turrialba, October 19, from New Orleans, with 182 pieces piling, for Atlantic Division; 175 pieces ties, for Pacific Division; 3,364 pieces lumber, 17 pieces piling, 29 cases brass bolts, 124 bundles hand cars, for stock; 38 cases incandescent lamps, 36 pieces locomotive tires, for Mechanical Division.

Zacapa, October 19, from New York, with 37 crates handles, 11 cases files, for stock.

Almerian, October 20, from Liverpool, with 200 barrels crude carbolic acid for stock.

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning October 21, 1911.

FRESH MEATS.	*Price.*
Mutton—Stewing, per pound	6
Shoulder, neck trimmed off, (4 pounds and over), per pound	9
Entire forequarter (not trimmed), 10 pounds and over, per pound	8
Leg (8 to 10 pounds), per pound	17
Cutlets, per pound	18
Short cut chops, per pound	20
Lamb—Stewing, per pound	6
Entire forequarter, neck trimmed off, per pound	9
Leg (5 to 8 pounds), per pound	20
Chops, per pound	24
Cutlets, per pound	24
Veal—Stewing, per pound	10
Shoulder, for roasting (not under 4 pounds), per pound	12½
Chops, shoulder, per pound	16
Chops, per pound	24
Loin, for roasting, per pound	24
Cutlets, per pound	28
Pork—Loin chops or roast, per pound	†20
Beef—Suet, per pound	2
Soup, per pound	5
Stew, per pound	8
Corned, No. 1, per pound	12
Corned, No. 2, per pound	10
Chuck roast (3 pounds and over), per pound	12
Pot roast, per pound	12½
Rib roast, second cut (not under 3½ pounds), per pound	16
Rib roast, first cut (not under 3 pounds), per pound	18
Sirloin roast, per pound	19
Rump roast, per pound	19
Porterhouse roast, per pound	20
Steak, chuck, per pound	12½
Round, per pound	13
Rib, per pound	18
Sirloin, per pound	19
Rump, per pound	19
Porterhouse (not less than 1½ pounds), per pound	20
Tenderloin (Western), per pound	24

MISCELLANEOUS.	
Caviare, Russian, per tin	47, 89
Livers—Beef, per pound	7
Calf, each	60
Half, each	30
Steak, Hamburger, pkg	13
Sausage—Bologna, per pound	10
Frankfurter, per pound	12
Lieberwurst, per pound	10
Devonshire Farm, per pound	17
Sweetbread—Veal, per pound	1.20
Beef, per pound	25
Eggs, fresh, dozen	†32
one-half dozen only	†17
Bluefish, fresh, per pound	14
Halibut, fresh, per pound	15
Shads, fresh, each	70
Shad roes, fresh, per pair	35
Oysters, 1 qt. kegs, per keg	50

POULTRY AND GAME.	
Chickens—Fancy roasting, milk fed, large, each	†1.35
Fancy roasting, milk fed, med., each	1.00
Fancy roasting, corn fed, about 4½ pounds, each	90
Fowls, each 60, 70, 80, 90,	1.00
Ducks, Western, about 4½ pounds, each	1.00
Broilers, milk fed, each	†70
corn fed, each	†60
Turkeys, per pound	26
Squabs, each	35
Capons, each	2.10
Fryers, corn fed, each	60
Partridges, each	50
Grouse, each	50

CURED AND PICKLED MEATS.	
Ham—German, Westphalia, per pound	36
Sugar cured, per pound	20
Sliced, per pound	22
Half, for boiling, per pound	21
Boiled, per pound	28
Hocks, per pound	‡8
Todd's Smithfield Virginia, per pound	30
Bacon—Breakfast, whole piece, per pound	23
Breakfast, sliced, per pound	24
Pork, salt family, per pound	13
Ox tongues, each	1.00
Pigs' feet, per pound	9
Tongues, per pound	18
Sliced bacon in 1-pound tins, per tin	30
In 1-pound jars, per jar	30

DAIRY PRODUCTS.	*Price.*
Butter—Creamery special, per pound	†35
Cheese—Roquefort, per pound	38
Philadelphia cream, cake	10
Philadelphia cream, cake	18
Young America, per pound	20
Swiss, per pound	26
Edam, each	1.00
Neufchatel, cake	6
Gouda, per pound	34
Milk (Certified), per bottle	**25
Buttermilk, bottle	**15
Fer-mil-lac, bottle	**25
Ice cream, quart	‡25
½-gallon	‡50

VEGETABLES AND FRUITS.	
Beets, per pound	3
Celery, per head	6
Cabbage, per pound	4
Cucumbers, per pound	4
Carrots, per pound	3
Cauliflower, per pound	7
Lettuce, per pound	12
Onions, per pound	3½
Peppers, green, per pound	10
Potatoes, sweet American, per pound	3
Potatoes, white, per pound	3
sweet, per pound	2
Pears, alligator, each	6
Parsnips, per pound	4
Romaine, per pound	15
Squash, per pound	3
Turnips, per pound	3
Tomatoes, per pound	6
Yams, per pound	3
Apples, per pound	5
Cantaloupes, each	†10
Grapes, per pound	†10
Grape Fruit, each	4
Lemons, dozen	24
Limes, per 100	80
Oranges, California, per dozen	36
Oranges, per dozen	12
Peaches, pound	†10
Plums, per pound	10
Pears, per pound	6

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Joachim* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct, leave on Thursdays at 3 p. m.; ships for New Orleans in the coastwise service on Thursdays at 4 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

The Leyland steamship *Asian* will sail for Texas City direct on the 30th inst.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, NOVEMBER 1, 1911. No. 10.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Adress all Communications

THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Bound Volumes of The Canal Record.

A limited number of bound copies of Volume 4 of THE CANAL RECORD will soon be ready for distribution for official purposes. These copies will be marked FOR OFFICIAL USE ONLY—*Property of I. C. C.* Heads of Departments are requested to advise the Secretary of the Commission at Ancon of the number of these volumes that they will require for use in their departments, citing the names of the persons to whom they should be issued.

Inner Harbor at Pacific Entrance.

Excavation of the basin of the permanent harbor at the Pacific entrance was begun on October 20 by the ladder dredge *Badger* which is removing the spit lying between the Canal channel and the lower waters of the Rio Grande, which empties into the Pacific opposite the sand wharf at Balboa, east of the Canal. The portion of the spit to be taken out lies between Station 2,242 and Station 2,200, the latter being about 4,200 feet from the southern end of the spit. The average width of the section to be excavated is about 1,000 feet, so that its area is approximately 90 acres. Its surface is now 8 feet above mean sea level, and it is submerged at extreme high tide. It is to be excavated to a depth of 40 feet below mean tide. Borings show that to this depth the material to be excavated is practically all mud and clay.

Within a short time another dredge will join the *Badger* in this work. This is only a portion of the excavation for the inner harbor as the present plans call for a basin of about 246 acres. Plans for the docks have not yet been decided upon.

Naos Island Trestle.

The building of a double track trestle 30 feet wide, from the end of the present one on the Naos Island breakwater to the island, a distance of 2,700 feet, will begin next week, for the purpose of increasing the amount of spoil that may be dumped daily and thus hastening the completion of the breakwater.

In building the trestle rows of piling, transverse to the axis, will be driven at intervalse of 13½ feet. Each row or bent will contain 9 piles, the 7 inside piles to be driven straight, while the outside piles will have a batter of 2 inches to a foot The cap of each bent will be 12 by 14-inch by 30 foot, and each trackway will rest on four stringers, 8 by 16 inches and 28 feet long, laid on the caps at a height of 11 feet above mean sea level. There will be a space between the ties of the two tracks of about ten feet and in this will be built track for the pile driver, thus allowing it to drive on either side of the trestle without moving from the center track. The piles will be 70 feet in length, with auxiliary piles 40 feet long, which may be spliced on if the penetration requires a longer pile. At such joints there will be four wood splice-plates, each 3 by 8 inches and 6 feet long, and bolted on with six ¾-inch machine bolts through the piles.

Between the present end of the trestle and Naos Island, scows have been dumping rock, both to form a base for the breakwater and to steady the piles which will be driven through this spoil to the rock below. The average depth to rock is about 60 feet below mean sea level, and the scows are laying a base about 200 feet wide. Since the sinking of the trestle does not begin until the top of the fill is above mean tide, the fill will be made to that elevation clear out to the island. Then the remainder of the fill will be made by trains dumping from the island end. In this way any sinking of trestle due to the jar of unloading will occur at the outer end, and the dumping of spoil between the point of subsidence and the mainland need not be interfered with.

Gatun Dam.

A natural depression near the downstream edge of the east wing of Gatun Dam, about 300 yards from the spillway, is being filled with spoil from the pipeline suction dredge *No. 86*, which is working in a borrow pit near the French channel. The fill will reinforce the dam and do away with a malarial swamp. It will require about a quarter of a million cubic yards of material. After the hydraulic filling has raised the surface of the area to that of the adjacent ground, earth and rock will be dumped on it from trains.

From the upper edge of the east wing of the concrete intake at Gatun spillway, a trestle has been built, parallel to the axis of the stream and in line with the instream side of the concrete work, to the point where a former trestle crosses the spillway gap, along the upper edge of the dam. Dumping from the new trestle was begun Monday and it is purposed to fill in the space between the trestles and the east dam, raising the surface from an average of 15 feet above sealevel to plus 45 feet. Approximately, 75,000 cubic yards of spoil will be required for this fill.

Miraflores Locks.

Excavation for the lower chamber of Miraflores Locks cut across what was once the channel of a small river. as is shown by the strata of gravelly material with which the bed had become filled. To block possible slides of the loose earth, the dirt is being removed to bedrock several feet back of the line of the lock wall and holes drilled into the rock for the insertion of steel rails, around which, as reinforcement, a concrete retaining wall is to be constructed. Excavation at this point is down to the ultimate required level, 55 feet below mean tide.

The Pacific Division has finished the electrical wiring and connecting for berm crane "E," dismantled at Pedro Miguel Locks and rebuilt at Miraflores by the McClintic-Marshall Company, and the crane has begun placing concrete in the east side wall of the upper lock chamber. This is the fourth and last of the berm cranes to be moved. There remain at Pedro Miguel Locks two cantilever chamber cranes, which can still be used to advantage in placing the remainder of the concrete there, in making backfill and in carrying machinery.

Fortification Work.

Work has been begun on a cement shed and office building, 28 by 60 feet, at Toro Point for use in connection with the fortification work at the Atlantic entrance. The building is being constructed of lumber from the old Commission hotel at Culebra. A type 17 house will be erected at Toro Point for the man who will superintend the fortification work under the direction of the Chief Engineer.

The Construction Quartermaster will complete the work of fitting up quarters for the fortification force at the Pacific entrance this week. An article in THE CANAL RECORD of September 27 gave details of the preliminary operations of which the furnishing of quarters forms a part. The quarters are remodeled buildings on Naos Island recently acquired from the Pacific Mail Company as part of its interest in the islands at the southern entrance to the Canal.

An Improved Rail Clamp.

A new rail clamp, invented by W. H. Bates, Superintendent of Steam Shovel Repairs, after a six months' trial, has been adopted and 350 will be put into service.

The function of this clamp is to act as a "stop" when a shovel is moving forward, to prevent its running off the end of the track; also to "block" the truck wheels securely in place when the shovel is working.

The clamp used heretofore was attached to the rail by means of a key driven under the base of the rail, consequently it was necessary to place the clamp between ties. When the track is in mud and water up to the rails the annoyance and delay incident to attaching the clamp are considerable; furthermore, the ties often interfere with locating the clamp where desired.

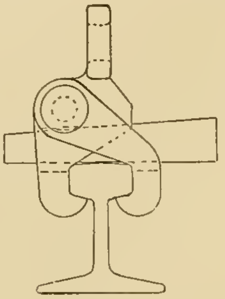
The new clamp is fastened to the rail by

NOTES OF PROGRESS.

(Continued.)

means of a tapered key of steel passing crosswise over the rail and thus permits the clamp to be set directly over a tie, or any place desired. The key being above the rail avoids the mud and water.

The principle on which the clamp works is similar to that of a pair of ice tongs. The clamp consists of two steel castings which form the hooks and body of the ice tongs as well as a convenient handle. These castings are fastened together by means of a heavy rivet which acts as a hinge pin. The hooks bear on the under side of the rail head when the wedge is driven above the rail, and below the hinge pin; thus giving a secure grip on the rail. The cost of the new clamp is considerably less than that of the old style.



RAIL CLAMP INVENTED AT EMPIRE SHOPS.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is about 71 per cent completed, 160,532 cubic yards, out of a total of 225,000, having been placed at the close of work on October 28. A statement of the amount laid each working day last week, and of the total in place, follows:

Date.	Concrete Laid.	Hours worked.	No. Mixers.
October 23	132	7.00	1
October 24	108	5.30	1
October 25	128	7.30	1
October 26	108	6.30	1
October 27	144	7.00	1
October 28	140	7.00	1
Total	760	40.30	1
Previously reported	159,772		
Grand total	160,532		

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending October 28, follows:

Date.	Hours worked.	Cubic Yards.
October 23	3.35	1,581
October 24	4.12	1,673
October 25	4.50	2,040
October 26	5.00	2,241
October 27	2.20	1,150
October 28	3.55	1,638
Total	23.52	10,323

Teachers and Clerks, Philippine Service

Examinations have been announced by the Civil Service Commission, which it is expected to hold at Culebra on December 27 and 28, for assistant (male), teacher (male and female), and industrial teacher (male), in the Philippine Service. Applications must be forwarded to this office before December 5.

The entrance salaries for male and female appointees from the above examinations will probably be from $1,000 to $1,200 per annum.

A limited supply of the announcement of the above examinations has been received. Persons interested should request a copy of announcement No. 777, but an application blank should not be requested unless, after reading the announcement, intention is had to apply for one of the examinations. The announcement should be *immediately* returned to this office in order not to delay the dissemination of the information contained therein.

JOHN K. BAXTER,
Secretary, Isthmian Civil Service Board.

CONCRETE WORK IN THE LOCKS.

Over 69 per cent of the concrete for the locks is in place, the amount at the close of work on October 28, being 2,926,698 cubic yards, out of a total of approximately 4,199,400. A total of 32,720 cubic yards of concrete was laid in the locks during the week ending October 28.

GATUN LOCKS.

Over 84 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on October 28 being 1,674,103 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending October 28, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers.			Large stone.	Total.

MIRAFLORES LOCKS.

Over 36 per cent of the concrete for the system of two twin locks at Miraflores was in place on October 28. the total amount on that date being 498,511 cubic yards, bucket measurement, out of a total of approximately 1,362,000. The record for each of the six 8-hour working days of last week, follows:

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant.							Total.
				2-cubic yard mixers.			½-cubic yard mixer.

COMMISSARY BUSINESS.

Details of Transactions in 1911 Compared with Those of 1910.

The business of the Commissary Department of the Panama Railroad Company during the fiscal year ending June 30, 1911, aggregated $5,754,955.69, an increase of $423,438.88 over the preceding year. Merchandise was imported to the value of $4,267,792.05, as compared with $3,913,519.14 for last year. A classified statement of importations, the figures being for cost, insurance and freight paid delivered on the Isthmus, follows:

CLASS.	1910.	1911.
Groceries	$1,064,075.27	1,278,594.79
Hardware	98,902.50	86,768 86
Dry goods	694,476 67	603,490.18
Boots and shoes	165,303.38	164,168 89
Cold storage supplies.	1,348,376.57	1,573,202.97
Furniture	11,918.59	9,020.48
Tobacco	153,986.84	182,590 96
Raw material	325,453.42	215,375.22
Paper, twine, stationery, etc	51,025.90	54,579.70
Total	$3,913,519.14	4,267,792.05

The relative percentage of goods under each classification sold through the retail stores during the year is as follows: Groceries and staples, 29.20; cold storage, 36.30; dry goods, men's furnishings and notions, 15.41; boots and shoes, 4.36; tobacco, cigars and confectionery, 3.97; hardware, 1.62; furniture, .19; stationery, 1.19; raw material, 7.76.

There were increases in the importations of fresh and pickled meats, and the prices on these were reduced. On some of the staple articles of groceries there were reductions in prices, but as a rule the prices of groceries maintained about the same level as obtained during the previous year. Prices on boots and shoes and standard dry goods were reduced. The following table gives the importations of meat and dairy products, in comparison with the statistics for the fiscal year 1910:

	1910.	1911.
Fresh meats, lbs	5,229,306	5,454,989
Cured and pickled meats, lbs	1,046,029	3,786,869
Cheese lbs	114,192	110,415
Eggs, doz	502,950	692,060
Butter, lbs	471,551	429,267
Poultry lbs	429,575	554,028
Fresh milk, gals	41,901	57,016
Fresh cream, gals	22,900	29,950

Importations of fresh vegetables for the two years were as follows, in pounds:

	1910.	1911.
Potatoes, white	4,586,967	5,250,609
Potatoes, sweet	638,584	787,881
Onions	717,557	1,151,921
Turnips	122,632	107,902
Beets	26,059	53,279
Carrots	91,830	101,788
Cabbage	656,905	640,681
Yams	424,789	193,127
Other vegetables including celery, tomatoes, squash, etc.	622,484	499,952

Fresh fruits were purchased abroad, for the two years, as follows:

	1910.	1911.
Apples, lbs	526,472	668,485
Peaches, lbs	63,944	42,958
Pears, lbs	21,780	45,637
Plums, lbs	17,706	30,825
Grapes, lbs	54,066	62,608
Oranges, doz	236,854	225,984
Lemons, doz	13,574	34,550
Grape fruit, doz	11,837	10,446
Limes, doz	5,493	6,848
Cantaloups, each	59,724	56,155
Watermelons, each	10,845	18 888
Other fruits, lbs	26,726	29,480

Sales and issues to all departments for the two years were as follows:

	1910.	1911.
Isthmian Canal Commission	$1,664,873.66	$1,625,348.77
United States Government	135,068.36	102,138.31
To others for cash	100,901.78	103,706.31
To others for coupons	3,083,064.13	3,609,358.01
Issued to departments of the railroad and used in operation of Commissary	229,328.02	208,223.82
Issued to Panama Railroad Steamship Line	9,501.84	8,904.09
Condemned and damaged goods, shrinkage, etc	108,779.02	98,276.38
Total sales	$5,331,516.81	$5,754,955.69
Average sales and issues per mo.	444,293.07	479,579.64
Stock on hand, June 30	1,391,342.33	997,175.60

A comparison of prices for June, 1911, as against June, 1910, of foodstuffs, shows that of the 262 items into which the goods are classified by the Commissary Department, 32 showed an increase in price in 1911; on 110 items the prices were the same; and on 120 items there were reductions.

Nineteen stores were maintained during the year, located at Cristobal, Gatun, Camp Totten, Monte Lirio, Tabernilla, San Pablo, Gorgona, Las Cascadas, Bas Obispo, Empire, Culebra, Rio Grande, Paraiso, Pedro Miguel, Corozal, Ancon, Porto Bello, and Toro Point. All stores except those at Camp Totten and Monte Lirio are provided with ice boxes of sufficient size to store meats and other perishable goods. Butchers are employed at Cristobal, Gatun, Gorgona, Las Cascadas, Empire, Culebra, Ancon, and Balboa.

MANUFACTURING PLANTS.

Laundry—There was a large increase in this department during the year, 3,581,923 pieces having been handled, as against 2,993,761 pieces during the previous year. During the first part of the year there was a reduction in prices ranging from 12.5 to 15 per cent. The revenue amounted to $98,303.27, as against $90,797.56 last year. The average number of employes served monthly was 7,260, a decrease of five from last year.

Bakery—Sixteen thousand, six hundred and thirty-eight barrels of flour were used during the year ending June 30, 1911, from which there were produced 5,236,474 loaves of bread, 557,557 rolls and 91,581 pounds of cake. The consumption of cake fell off 39,086 pounds from the year before but the amount of bread produced was greater by 344,073 loaves, and of rolls 53,554. The total value of the product for the year was $221,352.06.

Coffee Roasting Plant—During the year 330,491 pounds of coffee were roasted, producing 270,047½ pounds of roasted coffee. The value of the product was $60,543.86.

Ice Plant—The additional tank installed on June 17, 1910, increased the capacity of the plant sufficiently to enable it to meet all demands for ice. The total output for the year averaged about 90 tons per day and the present capacity of the plant is 100 tons per day; 33,267 tons were produced during the year, valued at $206,188.01. During the preceding year the amount manufactured (27,988 tons), had to be supplemented during several months by purchase from private plants locally and importations from New York.

Ice Cream Plant—During the year the ice cream plant was transferred to a new building erected for its use and with an increased capacity. The demand for the product grows steadily and the department anticipates greater increase in the coming year. During the year ending June 30, 1911, the plant manufactured 110,208 gallons, valued at $79,318.80, as against 91,321 gallons, valued at $62,379.93, for the previous year.

Automatic Weighing and Packing Department—By means of this arrangement flour, coffee, beans, rice and similar loose, dry cooking materials are weighed and packed in boxes of convenient measure ready for immediate delivery to the customer. The cost of packing amounts to about $1.90 per ton. Of varied articles a total of 3,915,775 pounds was packed this year, an increase of 1,445,815 over last year.

Power Plant—The installation of a 300-ton compressor, capable of running the entire ice-making and refrigerating plant and affording opportunity to close the other compressors for repairs, was completed during the year. The machinery has recently been subjected to overhauling and painting.

Cold Storage Plant—Additional storage was necessary to take care of increased importations and to provide a safer and more economical method of handling refrigerated supplies. By the conversion of an ice storage room into a cooler and the installation of three new coolers, the storage space was increased by 25,316 cubic feet, affording a total refrigerated storage space of 193,230 cubic feet.

Pickling Tank and Butter Printing Outfit—The contracts under which the Commissary Department has purchased beef have provided that it be taken in the carcass or in the quarter but the greater demand for hindquarters than for forequarters has necessitated a preponderant importation of the former. The price of beef is cheaper by the carcass and the Department has, therefore, constructed during the past year two pickling tanks, with net cubical contents of 595 feet, for the purpose of corning its own beef. By this means it is able to buy beef by the carcass, corn such of the forequarters for which there is no sale, and discontinue the importation of corned beef. The Department supplies from 1,500 to 2,000 pounds of corned beef daily.

Until this year butter has been bought in prints in the States, at an advance of about three cents per pound over butter in bulk. Moreover, in this way the surface exposure is greatly increased and it has to be carefully wrapped in tinfoil and parchment paper to preserve its freshness. A complete butter printing outfit has been installed in the cold storage plant and is now in full operation. It prints daily about 1,400 pounds of butter.

Laboratory and Experimental Kitchen—During the year a laboratory and experimental kitchen were installed. All food products are tested here, both as to quality and weight of package. Extract of vanilla, extract of lemon, bay rum and other similar products are manufactured here, effecting some economy.

American Veterans of Foreign Service.

The next regular muster and camp-fire, of the American Veterans of Foreign Service, will be held at the Culebra Lodge Hall on Saturday evening, November 4.

TEST OF GATE VALVES.

Experiments To Determine Friction Coefficients and Effectiveness of Sealing Devices.

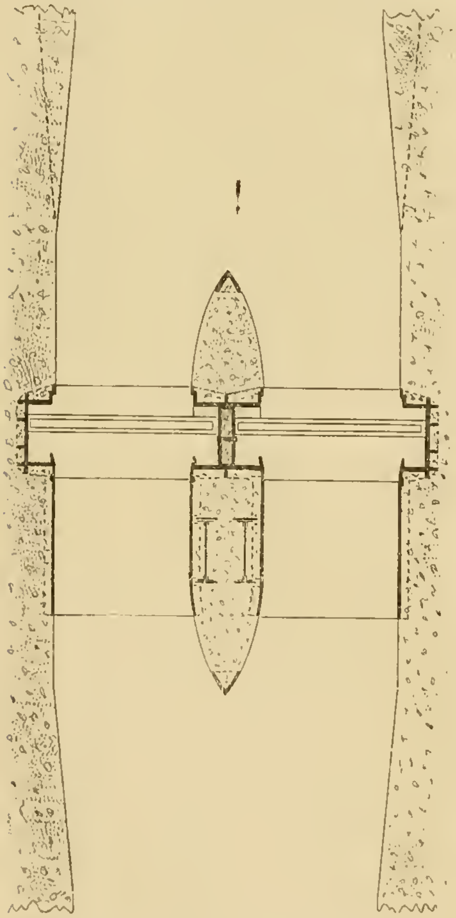
Tests of two Stoney gate valves for the locks, which have been in progress at Gatun for several weeks, have been completed, and the valves have been found satisfactory.

These valves will be installed in the culverts in the side and center walls of the locks, through which water from the upper levels will be let into the lock chambers, and will afford a means of regulating the flow.

When a ship enters one of the chambers on the ascent, the valves above that chamber will be opened and those below will be closed, thus turning water into the chamber and raising the ship. For a ship on the descent, the valves above will be closed and those below opened, thus allowing the water to flow from the chamber to a lower level, and consequently lowering the ship. A complete operation of a valve, letting in or shutting off the water, will require one minute.

At the points where the gate valves will be installed the culverts are 18 feet in diameter. Instead of closing the whole culvert with one valve, it has been divided into two chambers by a reinforced concrete pier in the center.

The plan herewith gives a horizontal section of the valve chambers, showing the center pier, and the niches in which the gates of the valves move. In operation the gates are moved up and down in these niches, on roller bearings, just as one would raise and lower a window, except that the power is applied through a stem fixed to the top of the gate and operated by a machine situated above the valve chamber. The valves consist of iron frames embedded in the concrete walls and movable gates built up of a framework of nickel steel "I" beams sheathed with ½-inch nickel steel buckle plate, with machinery to operate them. They are 18 feet 10 inches high, 10 feet 8 inches wide, and will weigh 21,597 pounds each. An article describing these valves, and others of similar construction; (lower guard gate valves, lateral culvert valves, and bulkhead gates) was published in THE CANAL RECORD of August 9, 1911. In all 130 rising stem gate valves, and 57 other gate valves will be used in the locks, and the tests completed last week apply to the 130 rising stem valves.



HORIZONTAL SECTION THROUGH VALVE CHAMBER, SHOWING CONCRETE PIER DIVIDING CULVERT INTO TWO CHAMBERS FOR VALVE EMPLACEMENT. Length of chamber 53 feet 6 inches; width, 20 feet 3 inches; niches for valves 14½ inches deep; length of pier 25 feet 3 inches, width 4 feet 3 inches.

FRICTION TESTS.

In making these tests two valves were mounted in one of the valve chambers in the west side wall of the locks at Gatun, the culvert above the valves was closed, and the valve chamber was then filled with water to a height of 79 feet. The tests were made to determine the total friction and the effectiveness of the sealing device.

In designing the machinery it was assumed that the friction to be overcome would be 4 per cent of the water pressure. It remained to determine by test the actual frictional resistance of the valves when operated under pressure, which resistance added to the weight of the gates and one half the roller trains equals the weight that each machine must be capable of lifting. On the theoretical assumptions the total weight each machine must lift was placed at 40,000 pounds. The machines were designed to lift 60,000 pounds, and the tests show that the actual weight to be lifted will be between 41,500 and 44,500 pounds. The results of the tests for the determination of the coefficient of friction have been tabulated as follows:

ITEM.	Gate 260	Gate 261
	Lbs	*Lbs.*
Pull required to lift gate—Culvert empty	24,000	25,000
Weight of gate	20,500	20,500
Friction of seals—initial	3,500	4,500
Friction of seals—added for water pressure (1)	4,170	4,170
Friction for seals—total	7,670	8,670
Total pressure on gate—(Calculated—h=79′)	651,000	651,000
Dynamometer pull to break seal	37,500	40,000
Lifting force on upper seal (Calculated)	5,420	5,420
Total upward force	42,920	45,420
Weight of gate—(calculated)	20,500	20,500
Total friction	22,420	24,920
Friction of seal from above	7,670	8.670
Roller friction	14,750	16 250
Dynamometer pull to hold gate	41,500	44,500
Suction	4,000	4,500
Total friction plus suction	26,420	29.420
Coefficient of friction—total (2)	.0344	.0383
Coefficient of roller friction (3)	.0226	.0251
Combined coefficient (4)	.0407	.0460

(1) Friction of seals under water pressure is calculated using 0.25 as coefficient.

$\frac{550''}{144}$ x 62.5 x 69.7 x .25=4170 pounds.

(2) Average coefficient of friction—total .0363

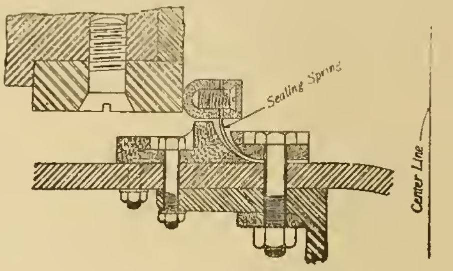
(3) Average coefficient of roller friction .0239

(4) Average combined coefficient .0433

SEALING DEVICES.

Each gate will move in its niches on a live roller train, and there will be a play of ¼ of an inch both laterally and up stream. Under a head, a large amount of water would pass between the gate and the niches in which it moves, if some method of sealing the gate were not provided. At the bottom the gate, when closed, will rest upon babbit metal fixed to the sill, and at the top there will be a seal of rubber on the gate which will press tightly against the valve casing.

The side seals are a new device proposed by a designing engineer in the office of the Assistant Chief Engineer. They consist of a plate of 1/16 inch phosphor bronze 18 feet long fixed to each side of the gate with its free end bearing upon a guide in the valve casing. When the gate is moved up or down in opening or closing the valve the bronze seal moves with it. When the gate is down, and the valve, therefore, closed, the seals at bottom, top and sides meet and make the closure practically complete. The drawing herewith shows the position of the side sealing device upon the gate and its bearing upon the valve frame. There will be required 260 sealing devices, with a total of 29,340 pounds of rolled bronze spring straps, 67,210 pounds of cast bronze guides, and 11,670 pounds of bronze bolts and washers.



SECTION THROUGH GATE VALVE SHOWING METHOD OF ATTACHING BRONZE SEALING DEVICE. UPSTREAM SIDE IS TOWARD TOP OF PAGE.

The tests showed a maximum leakage under a 79-foot head for two valves of 1.82 cubic feet per second or 819 gallons a minute. Under operating conditions, when there will be a head of thirty feet, the leakage for a pair of valves will be about 0.8 of a cubic foot per second.

Misdirected Letters.

ANCON, C. Z., November 1, 1911.

The following insufficiently addressed letters originating in the United States and its possessions, have been received in the office of the Director of Posts, and may be secured upon request of the addressees:

Buchanan, Reuben
Byrne, Joseph A.
Cason, John B.
Cox, Clevis M.
De Caen, Mrs. Richard
Frederikson, Frederick F.
Gibson, Fred C.
Harajian, Horan
Holt, Max
Janis, William
King, Miss Bella
King, Harry (pkg.)
Little, J. A.
McFarlane, Simon R. W.
McGrath, Mrs. Bessie
Mezzone, Pasquale
Murray, James E.
Nelson, Elliott
Olmstead, Harry J.
Portugal, Ch. H.
Powell, Miss Lula
Rawley, Frank
Rigaces, Umberte
Roberts, Dr. C. W.
Schafer, M. Rex
Spooner, M.
Sulway, David
Turner, Miss Carrie
Watson, Simeon
Williams, John H

Band Concert

A band concert will be given by the Isthmian Canal Commission Band at Gatun, C. Z., on Sunday, November 5, 1911, at 5 p. m.

The next concert will be given at Gorgona, on November 12, at 6.00 p. m.

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending November 8,1911 (75th meridian time):

DATE.	Low.	High.	Low.	High.
	A.M.	A.M.	P.M.	P.M.
November 2		6.15	12.25	6.35
November 3	12.45	7.05	1.15	7.25
November 4	1.30	7.50	2.00	8.10
November 5	2.15	8.35	2.45	8.50
November 6	3.00	9.15	3.25	9.35
November 7	3.38	10.00	4.05	10.15
November 8	4.20	10.40	4.50	11.00

LOCK MACHINES ERECTION.

Plant Required and Conditions of its Use.

New plant to the value of over forty thousand dollars will be required for the erection of lock operating machinery at Gatun, Pedro Miguel, and Miraflores, and a requisition for this plant, consisting of four locomotive cranes and four stiff leg derricks has been made on the Washington office. The specifications are so framed that manufacturers may offer cranes or derricks of standard makes conforming substantially to the requirements.

In the study of the conditions under which the operating machinery will be installed, the office of the Assistant Chief Engineer, under whom this work will be done, has determined that there will be required, besides the new plant mentioned above, four locomotive cranes now on the Isthmus, which will be transferred from other work. The amount of plant required is lessened by the fact that the erection at Miraflores will be approaching its summit point while that at Gatun will have passed that stage, and thus plant used at Gatun may be transferred to Miraflores. It is estimated that a total of 131,284 tons of material must be handled in the erection work, divided as follows:

ITEM.	Quantity.	Tons.
Machines, including chain fenders	536	13,616
Track, feet	97,854	8,117
Manhole covers	1,110	1,251
Electrical equipment		7,000
Steel work		1,300
Concrete, cubic yards	50,000	100,000
Total		131,284

The erection period is estimated as eighteen months from January 1, 1912. The greater portion of the machinery will be handled at least twice, in addition to handling in and out of storage. Assuming that one crane is the equivalent of two derricks, making the plant consist of ten working units, the following figures are an expression of the work to be performed:

Total tonnage handled by each crane	7,293	tons.
Average total per crane per month	729	tons.
Average total per crane per day	29	tons.
Average concrete per crane per month*	536	tons.
Average steel per crane per month	7.2	tons.
Average number of machines set per crane per month	1	

*The amount of concrete to be handled per month is small due to the delicate work and long waits inevitable in the setting of heavy machine parts.

In general the lock operating machinery is centralized in small groups at various parts of the locks; rendering the partial use of derricks feasible. At Gatun for instance there are ten of these groups in the center wall, and it will always be possible to handle four machines from one location, and frequently to serve six machines at one setting of a derrick. The machine pits are in the lock walls and all the handling will be done from the top of the walls. Owing to the bridges used in the miter gate erection, it has been decided to use derricks on the center walls, in preference to locomotive cranes. On the side walls, where the miter gate construction bridges do not interfere with free movement along the wall, locomotive cranes will be used.

Locomotive Cranes.—The locomotive cranes called for under the specifications must be capable of handling 8,000 pounds at a 40 foot radius (the horizontal distance between the centers of the hoisting hook and the crane center pin or post) when the outriggers are not in use; and 30,000 pounds at a 15-foot radius. They must operate on the 5-foot gage track, clear the rack in the center of the tracks, which requires 8 inches above the top of the traction rail, in the center, and elsewhere have a clearance of at least 6 inches, have a chain or gear drive for self propulsion along the track at the rate of five miles an hour when fully loaded, and be capable of self propulsion up a 3 per cent grade when heavily loaded. The engine must be double and provided with a locomotive link reversing motion or a reversible hoisting gear. The drum must be not less than 36 inches in diameter, drum friction not less than 42 inches, and the length if possible sufficient to take the whole line without an overlap. The hoisting line must be $\frac{7}{8}$-inch plow steel with hemp center, and so long that the load may be hooked on 70 feet below the top of the rails, with the boom at the minimum radius.

Stiff-leg Derricks.—The derricks will be of steel construction and of the common stiff-leg type, mounted upon skids or shoes in order that they may be moved with the minimum amount of work. They must be capable of lifting and swinging safely a maximum load of 22,000 pounds at a radius of forty feet. The boom must be 70 feet long from center of foot pin to center of out sheaves, and must have a swing of nearly three quadrants. The mast is to be of the minimum possible height, and will rotate upon ball and socket bearings. The bull wheel shall be not less than 12 nor more than 14 feet in diameter. The lines must be not less than $\frac{3}{4}$ inch diameter, of hemp center plow steel wire, and long enough to make a 70-foot lift.

Power will be supplied from a double engine and vertical boiler, which, with the hoisting drums and gear, will be mounted upon a cast iron or structural steel bedplate securely bolted to the base frame. There will be two drums, with one reversible drum swinging gear, equipped with friction clutches, ratchets, pawls, and operating levers complete. At least one of the drums must be equipped with a shaft extension and winch. The drums must be 16 inches in diameter and, if possible, of sufficient length to take the whole of the hoisting line without overlapping. An alternative bid is requested upon an electric hoist, the driving motor to operate upon a three-phase, 25 cycle, 220 volt, secondary circuit.

Stages of the Chagres.

Maximum heights of the Chagres River for the week ending midnight, Saturday, October 28, 1911. All heights are in feet above mean sea level.

DAY AND DATE.	STATION.				
	Vigia.	Alhajuela	Gamboa.	Bohio.	Gatun Lake.

OFFICIAL CIRCULARS.

Private Work by I. C. C. and P. R. R. Employes.

CULEBRA, C. Z, October 26, 1911.

CIRCULAR No. 417:

No employe of the Isthmian Canal Commission or Panama Railroad Company will perform work for any individual or company during the employe's regular working hours unless the performance of the work has been authorized by this office on Form C. E. 159 and the usual work order issued by the proper official, except that the Chief Quartermaster is authorized to approve the performance of work by employes of the Quartermaster's Department for employes of the Isthmian Canal Commission and the Panama Railroad Company when the total cost of the job does not exceed ten dollars.

Heads of divisions, departments and shops are authorized to permit employes of the Isthmian Canal Commission and the Panama Railroad Company to use machines, tools, etc., in the performance of private work for employes only, provided the work is not performed by the employe during his regular working hours, the machine and tools can be spared for such use, and the use of them for the purpose will not result in their being injured.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Ink on Pay Certificates.

EMPIRE, C. Z., October 26, 1911.

ALL DEPARTMENTS:

An ink called "Combined Copying and Writing Fluid" is now being furnished from the Mount Hope Storehouse which when used upon pay certificates is inclined to run, making the figures uncertain, which is particularly inconvenient when the brass check number is so affected and I have to request that this ink be not used in writing pay certificates and time vouchers. Only black writing fluid should be used for such purposes.

Respectfully,
W. M. WOOD,
Disbursing Officer.

Approved:
GEO. W. GOETHALS,
Chairman and Chief Engineer.

Sale of Panama Cafe Building.

PANAMA RAILROAD COMPANY,
OFFICE OF GENERAL SUPERINTENDENT,
COLON, R. P., October 27, 1911.

Sealed proposals for the purchase of building located on lot north of Panama passenger station, and known as "Panama Railroad Cafe" building, will be received in this office until 3.00 p. m., November 20, and then opened.

Bids must be made for the building as it stands on the ground, the successful bidder to remove the building within thirty days' time after notified that bid has been accepted.

Proposals should be accompanied by certified check, Post Office money order, or cash, for 5 per cent of the amount of bid, which will be returned to unsuccessful bidders.

The successful bidder will be given a freight rate of $2.25 per ton in case it is desired to ship the material to any point along the line.

Envelopes containing bids should be endorsed: "Proposal for purchase of "Panama Railroad Cafe Building," and addressed to

J. A. SMITH,
General Superintendent,
Panama Railroad Company.

Rainfall from October 1 to 28, 1911, Inclusive.

SOCIAL LIFE OF THE ZONE.

Work of Various Organizations.

There will be a meeting of the executive board of the Canal Zone Federation of Women's Clubs at the Commission clubhouse, Empire, on Monday afternoon, November 6, at 2.30 o'clock.

Meetings of the Gatun Woman's Club were resumed in October. There will be two meetings in each month. On the second Thursday the meeting will be devoted to the business of the club, and on the fourth Thursday there will be a social meeting with a program under the social and literary committee. The club will hold a social evening for their friends in December.

Meetings of the Paraiso Woman's Club for the months of November and December will be as follows: On Wednesday, November 1 and 15, there will be business meetings with a program and on December 6 and 20, meetings with programs. At the meeting on October 18, the subject of woman suffrage was discussed.

On November 8, the home department of the Cristobal Woman's Club will have as its program the discussion of home life in Switzerland.

The Little Workers, a sewing club composed of young girls, was organized at Gorgona on Friday, October 20. The purpose of the club is to teach the members plain sewing, button hole making, and embroidery, and to promote a social feeling among the young girls of the village. The meetings will be held weekly on Saturdays at the homes of the members. The officers are, Jane Calvit, president; Mary Halligan, vice-president, and Anna Cody, secretary.

Charity Ball at Cristobal.

The annual charity ball of the Cristobal Woman's Club will be held at the Commission clubhouse on Thursday evening, November 2. The receipts will be devoted toward defraying the expenses of the anti-tuberculosis work that is being carried on under the auspices of the club in the city of Colon.

Church Notes.

The Culebra Christian League held a "social" and entertainment at the Commission chapel on Thursday evening, October 26. There was a program consisting of musical selections and recitations. This is the first entertainment that has been given by the league since August. It is the intention to hold a monthly entertainment in order to keep up social interest among the members of the organization.

On Sunday, November 12, the Isthmian Sunday School Association will hold a convention in the chapel at Gorgona, beginning at 2.15 p. m. The speakers will be Commissioner Maurice H. Thatcher, who will deliver an address on Sunday school work, Judge Thomas E. Brown, who will speak on the value of Bible study, and the Rev. Aquila Lucas, who will lead a discussion of practical work in the Sunday school and teachers' problems. Officers and teachers in all of the Sunday Schools are urgently invited to be present, and others interested in the work will be welcomed.

The corporate communion of the Woman's Altar Guild of St. Luke's Church, Ancon, will be held on November 1, at 9 a. m. The annual meeting, with election of officers, will be held at the Hotel Tivoli on Tuesday, November 7, at 3.30 p. m.

The Ladies Aid Society of the Methodist Episcopal Church will hold its annual bazar at Ancon hall on November 17. There will be booths containing fancy articles, cakes, candies and ice cream.

The bazar is given in aid of the work of the society. The sale will be open both afternoon and evening.

Two Sunday schools have been organized at Balboa and at East Balboa by representatives of the Methodist Episcopal Church. At old Balboa the school is held in the mess hall at 2 p. m. and has an enrollment of 25 and one teacher. The East Balboa school meets in the hotel at 3 p. m. There are 25 pupils and several teachers.

The woman's altar guild of Christ Church, Colon, held a musical and tea at the clubhouse on Saturday afternoon, October 28. The receipts, which amounted to nearly $100, will be used to meet the deficit in the church expenses. The program given was as follows: Piano solo, prelude, Rach Manieff, Miss Dorothy Leyland; baritone solo, (*a*) Thora, Stephen Adams, (*b*) A Rose In Heaven, selected, Mr. R. Mosher; violin solo, (*a*) Les Audeaux, Pable de Sarneate, (*b*) Seranade, Par R. Drige, Dr. Eugene Hill; contralto solo, (*a*) Violets, Ray Remaine, (*b*) Ma Curly Headed Baby, selected, Miss Bessie M. Sweeney; tenor solo, (*a*) Pagliacci, R. Leonaccalle (*b*) No e Ver, Sito Mattei, Arture Petrozzoni; piano solo, Polanaise, Chopin, Miss Dorothy Leyland; baritone solo, (*a*) If You Were There, Frank L. Prince, (*b*) Asthore, H. Tretere, William Bennyhoff.

Order of the Eastern Star.

On Wednesday, October 25, Orchid Chapter, No. 1, Order of the Eastern Star was organized in the lodge hall at Gorgona. The Rev. Willis D. Engle, of Indianapolis, Worthy Grand Patron of the General Grand Chapter of the order, performed the rites of institution, assisted by Past Grand Worthy Matron, Mrs. Rosetta Brown. There were 73 charter members. The meeting was in two sessions beginning at 2.30 p. m. with a recess at 5 o'clock. The evening session closed with a reception. The officers installed were as follows. Worthy Matron, Mrs. Annie L. Calvit; Worthy Patron, Washington van Arsdale; Associate Matron, Mrs. Jennie Jones; Secretary, Mrs. Katherine Casey; Treasurer, Mrs. Agnes Fahr; Conductress, Mrs. Minnie Kosier; Associate Conductress, Mrs. Agnes McCombs; Chaplain, Mrs. Eleanor Babbitt; Marshall, Mrs. Martha Wilson; Organist, Mrs. Ada Shady. The five points of the star are represented by Mrs. Ceporiah Bain, Mrs. May Jarvis, Mrs. Emma Fahr, Mrs. Anna Lucachese, and Mrs. Emma Wilson. Mrs. Lily M. Houston is the warder and Stephen E. Calvit is the sentinel. The new chapter will hold meetings on the second Wednesday evening in each month at 7.30 o'clock and on the fourth Wednesday afternoon in each month at 3 o'clock.

M. J. McCarty, an American formerly in the Canal employ, and latterly employed by the Panaman Government in well drilling in the interior of the Republic, shot himself through the head on Saturday night, October 28, while on his way from Pedro Miguel to Paraiso. He was about 40 years of age and had lived on the isthmus since the beginning of the American occupation.

PERSONAL.

Lieut.-Col. W. L. Sibert sailed on the *Ancon* on October 31, for the States, on leave.

Among the passengers on the *Panama*, which arrived on October 30, were, Lieut.-Col. C. A. Devol, with Mrs. Devol, Mr. S. B. Williamson, Mr. C. M. Saville with Mrs. Saville and Mr. E. J. Williams.

The Hon. H. Percival Dodge, accompanied by Mrs. Dodge and their daughter, arrived from France on October 29, to take up his duties as American Minister to Panama. They are at present at the Hotel Tivoli.

The party of Senators, who arrived on the Isthmus on the *Ancon* on October 21, spent several days in going over the line of the Canal inspecting various phases of the work, and devoted the closing days of their visit to hearings at the Hotel Tivoli. All the members of the party with the exception of Senators Wetmore and Thornton returned on the *Ancon*, leaving the Isthmus on October 31. Senator Wetmore has been ill at Ancon Hospital during the entire visit and will not be able to travel for several days. Senator Thornton will return to New Orleans on the United Fruit Company ship on November 2.

Missing Man.

Any one having information regarding the whereabouts of Oskar Fischer (Oscar Fisher), who is supposed to be on the Isthmus of Panama, is requested to communicate with THE CANAL RECORD.

Pilots, Mates, Masters, Engineers, Chauffeurs.

Examinations for pilots, mates, masters and engineers; and for chauffeurs, will be held by the Board of Local Inspectors at the Administration Building, Ancon, November 8, 1911. All applicants for license as chauffeurs must secure from the Department of Civil Administration, Executive Office, Ancon, forms of application, and information respecting the filling out of the same, not later than the day previous to the examination. All applicants for examination must be present at the Administration Building at 8.00 a. m. on November 8, with papers in proper form. In addition, applicants for chauffeurs' licenses must demonstrate their capacity properly to operate an automobile, and must have the automobile with them.

Ancon Crusher.

A statement of rock crushed at the Ancon quarry during the week ending October 27, follows:

DATE.	Hours worked.	Cubic Yards.
October 23	6.50	2,293
October 24	7.05	2,523
October 25	*	400
October 26	7.05	2,344
October 27	9.00	3,200
Total	38.00	10,760

*Crusher shut down, putting new shaft in No. 12 crusher.

The Knights of Pythias of Gatun will take a sightseeing trip over the relocation of the Panama railroad, between Gatun and Gamboa, through Culebra Cut, over the Pacific Division work, and out upon the Naos Island breakwater on November 3.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The standing of the teams of the Isthiman Basket Ball League on October 28, was as follows:

Cristobal...........	4	0	1.000
Gorgona...........	3	1	.750
Gatun.............	3	1	.750
Culebra............	2	2	.500
Empire............	0	4	.000
Corozal............	0	4	.000

The result of basket ball games played on October 28, were as follows: Cristobal, 25, Corozal, 10; Gorgona, 23, Culebra, 11; Gatun, 20, Empire, 15. Games to be played November 4, are: Empire at Cristobal; Gatun at Culebra.

COROZAL.

Dr. Connor, Acting Health Officer of Panama, gave an informal lecture Wednesday evening on the subject "Tuberculosis." A general discussion followed the lecture.

The pool tournament closed with Mr. Baker winning the cue. Messrs. Norenberg and Jones tied for second place. A handicap tournament will be started in the near future. Those desiring to enter should hand their names to Manager Wilson.

CULEBRA.

The following are the results of the league bowling games for the week:

Culebra				Empire.

Burns......	172	143	170	Haggerty..	171	155	144
Totals	888	766	887		864	803	825

About one hundred and forty people attended the weekly song service last Sunday evening. Mrs. Shady played the piano, Mr. E. Reinhold the violin and Mr. J. T. Hopkins the cornet. Sunday evening November 5 the weekly song service will be held at 7.00 preceded by moving pictures portraying the Bible scene "Christ and the Woman at the Well."

The physical department has made arrangements to give massage in the locker room on Tuesday and Friday evenings.

Tennis is being played in the gymnasium from 5.00 to 7.00 o'clock on all evenings when it does not interfere with other arrangements. All members are eligible to participate.

GATUN.

Gatun won all the three games of bowling from Camp Elliott on Saturday evening, October 28. The scores are as follows:

Gatun.				Camp Elliott.			
Omeara....	121	129	182	Weigely...	169	140	127
Chamber'n.	130	172	171	Kribel....	148	131	155
DeMoll....	196	181	176	Janke.....	131	142	168
Galloway..	155	203	173	McDowell.	133	150	147
Barte.....	191	192	176	Clause....	210	154	152
Total....	793	877	828		791	717	749

The initial meeting of the discussion club was held on Sunday evening October 29. The subject was "Employers' Liability." The club will meet every Sunday evening from 6 to 7 o'clock.

Dr. Connor will give a lecture at the clubhouse on Wednesday evening November 29, on "Tuberculosis."

A class for the study of Spanish by the conversational and objective method will be formed at the Gatun clubhouse in the near future. Senor Jose Gomez, formerly a student at the Institute of Seville in Spain and of the University of Havana will be the leader. A charge of twenty-five cents per lesson will be made. It has not yet been decided how long the course will run. No text books will be required. If there is a sufficient number of women in Gatun who care to study Spanish a class will be formed exclusively for women.

A hand ball tournament will be started on November 9.

CRISTOBAL.

On Wednesday night October 25, L. A. Mason gave an address on the Installation and Operation of Lock Machinery.

Senators Bristow and Cummins addressed the Debating Club on the evening of Monday, October 30.

On Wednesday November 8, at the Literary and Debating Club an address, "The Immortal Abraham Lincoln," will be given by W. F. Morrison.

The Discussion Club will be lead on November 6, by W. H. Warr secretary at Empire.

The Cristobal bowling team won two out of three games from Gorgona on the local alleys on Saturday night by the following scores:

Gorgona.				Cristobal.			
Arnold....	153	141	131	Gibson....	150	157	110
Sims.......	216	167	131	Blackburn.	173	187	148

† Saturday night.

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning November 1, 1911.

FRESH MEATS.	*Price.*
Mutton—Stewing, per pound	6
Shoulder, neck trimmed off, (4 pounds and over), per pound	9
Entire forequarter (not trimmed), 10 pounds and over, per pound	8
Leg (8 to 10 pounds), per pound	17
Cutlets, per pound	18
Short cut chops, per pound	20
Lamb—Stewing, per pound	6
Entire forequarter, neck trimmed off, per pound	9
Leg (5 to 8 pounds), per pound	20
Chops, per pound	24
Cutlets, per pound	24
Veal—Stewing, per pound	10
Shoulder, for roasting (not under 4 pounds), per pound	12½
Chops, shoulder, per pound	16
Chops, per pound	24
Loin, for roasting, per pound	24
Cutlets, per pound	28
Pork—Loin chops or roast, per pound	20
Beef—Suet, per pound	2
Soup, per pound	5
Stew, per pound	8
Corned, No. 1, per pound	12
Corned, No. 2, per pound	10
Chuck roast (3 pounds and over), per pound	12
Pot roast, per pound	12½
Rib roast, second cut (not under 3½ pounds), per pound	16
Rib roast, first cut (not under 3 pounds), per pound	18
Sirloin roast, per pound	19
Rump roast, per pound	19
Porterhouse roast, per pound	20
Steak, chuck, per pound	12½
Round, per pound	13
Rib, per pound	18
Sirloin, per pound	19
Rump, per pound	19
Porterhouse (not less than 1½ pounds), per pound	20
Tenderloin (Western), per pound	24
MISCELLANEOUS.	
Caviare, Russian, per tin	47, 89
Livers—Beef, per pound	7
Calf, each	60
Half, each	30
Steak, Hamburger, pkg	13
Sausage—Bologna, per pound	10
Frankfurter, per pound	12
Lieberwurst, per pound	10
Devonshire Farm, per pound	17
Sweetbread—Veal, per pound	1.20
Beef, per pound	25
Eggs, fresh, dozen	32
one-half dozen only	17
Bluefish, fresh, per pound	14
Halibut, fresh, per pound	15
Shads, fresh, each	70
Oysters, 1 qt. kegs, per keg	50
POULTRY AND GAME.	
Chickens—Fancy roasting, milk fed, large, each	1.35
Fancy roasting, milk fed, med., each	1.00
Fancy roasting, corn fed, about 4½ pounds, each	90
Fowls, each 60, 70, 80, 90,	1.00
Ducks, Western, about 4½ pounds, each	1.00
Broilers, milk fed, each	70
corn fed, each	60
Turkeys, per pound	†28
Squabs, each	35
Capons, each	2.10
Fryers, corn fed, each	60
Partridges, each	50
Grouse, each	50
CURED AND PICKLED MEATS.	
Ham—German, Westphalia, per pound	36
Sugar cured, per pound	20
Sliced, per pound	22
Half, for boiling, per pound	21
Boiled, per pound	28
Hocks, per pound	‡8
Todd's Smithfield Virginia, per pound	30
Bacon—Breakfast, whole piece, per pound	23
Breakfast, sliced, per pound	24
Pork, salt family, per pound	13
Ox tongues, each	1.00
Pigs' feet, per pound	9
Tongues, per pound	18
Sliced bacon in 1-pound tins, per tin	30
In 1-pound jars, per jar	30
DAIRY PRODUCTS.	
Butter—Creamery special, per pound	35
Cheese—Roquefort, per pound	38
Philadelphia cream, cake	10
Philadelphia cream, cake	18
Young America, per pound	20
Swiss, per pound	26
Edam, each	1.00
Neufchatel, cake	6
Gouda, per pound	34
Milk (Certified), per bottle	**25
Buttermilk, bottle	**15
Fer-mil-lac, bottle	**25
Ice cream, quart	‡25
½-gallon	‡50
VEGETABLES AND FRUITS.	
Beets, per pound	3
Celery, per head	6
Cabbage, per pound	4
Cucumbers, per pound	†6
Carrots, per pound	3
Cauliflower, per pound	7
Egg Plant, per pound	10
Lettuce, per pound	12
Onions, per pound	3½
Peppers, green, per pound	10
Potatoes, sweet American, per pound	3
Potatoes, white, per pound	3
sweet, per pound	2
Pears, alligator, each	6
Parsnips, per pound	4
Parsley, per pound	10
Squash, per pound	3
Turnips, per pound	3
Tomatoes, per pound	6
Yams, per pound	3
Apples, per pound	5
Cantaloupes, each	10
Grape Fruit, each	4
Lemons, dozen	24
Limes, per 100	80
Oranges, per dozen	12
Peaches, pound	10
Plums, per pound	10
Pears, per pound	6

Supplies for the Canal.

The following steamers, with supplies for the Isthmian Canal Commission, arrrived at the ports of Cristobal, Colon, and Balboa, during the week ending October 28:

Prinz Eitel Friedrich, October 22, from New York, with 3 cases of hardware, for stock.

Atrato, October 22, from New York, with 11 cases of shipping tags, for stock.

Santona, October 23, from Baltimore, with 135 bundles of valve material, 26 pieces of valve material, 10 cases of valve material, 2,692 pieces of steel ties, 2,543 pieces of steel bars for Pacific Division: and 92 bundles of valve material, 18 pieces of valve material, 37 cases of valve material, 1,687 pieces of steel ties, 64 bundles of railway rack material for Atlantic Division; 4,330 pieces of steel plates, 214 kegs of rivets, for Panama Railroad Company; 798 pieces of lumber for Mechanical Division; 4,500 bundles of splice bars, 300 pieces of steel plates, 300 kegs of railroad spikes, 1,110 kegs of wire nails, 10 cases of paint and 8 barrels of paint, for stock

Ailsawald, October 25, from Baltimore, with 16,750 cases of dynamite, 200 bundles of brooms and 3,000 bundles of tie plates for stock; 157 pieces of couplers and 400 car wheels for Mechanical Division; 4,583 pieces of steel rail for Panama Railroad Company.

Trebia, October 25, from New York, with 114,320 bags of cement for the Atlantic and Pacific Divisions and 10 cases of benzine for stock.

Advance, October 25, from New York with 5 cases of steel plant material for the Mechanical Division; 8 cases of filter plant material and 8 pieces of steel channels for the Atlantic Division; 13 life preservers, 25 bundles of scoop shovels, 75 cases of caustic soda, 13 cases of deck brushes, 13 cases of insulated wire, 8 bundles of steel wire, 15 cases of stove parts, 9 cases of oil pumps, 300 cases of washing powder, 50 crates of refrigerators, 14 cases of toe calks, 10 cases of blasting batteries for stock, and 36 pieces of steel beams for the Panama Railroad Company, and a miscellaneous cargo, the whole consisting of 673 packages, weighing 120 tons.

Parismina, October 26, from New Orleans, with 167 bundles of packing cases for the Sanitary Department, 134 pieces of creosoted piling for the Atlantic Division, 1,000 kegs of white lead, 50 crates of paste, 63 bundles of shingles, 25 pieces of piling, 1,215 bales of straw, 13,536 pieces of lumber and 7 cases of cotters for stock.

Almirante, October 26, from New York, with 1,060 pails of grease, 9 cases of hose and 800 drums of oil for stock, and 6 pieces of steel girders for the Atlantic Division.

Pleiades, October 27, from San Francisco with 89 pieces redwood lumber for the Mechanical Division.

FOUND—At Corozal, an open face filled case watch. It can be obtained by calling and identifying property at House 140, Room 24, Paraiso.

There will be a baseball game between picked teams from Gorgona and Cristobal on the Lincoln House grounds, Colon, Friday morning, November 3, at 10 o'clock.

MOVEMENT OF OCEAN VESSELS.

The following is a list of the sailings of the Panama Railroad Steamship Company; of the Royal Mail Steam Packet Company; of the Hamburg-American Line, and of the United Fruit Company's Line.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, NOVEMBER 8, 1911. No. 11.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Switchback Utilization at Gatun

In order to lift the trains bearing spoil from Culebra Cut to the top of the west wing of Gatun Dam, a switchback has been built on the lower side, from the spillway, running beyond the extreme western end of the dam on a grade of 1 per cent. Near the far end is a switch, on which the trains run back in the final climb to the place of dumping. Steamshovel 116 is borrowing material from the hills beyond the end of the dam and it advances upward on a 1 per cent grade, clearing a way for the continuance of the switchback. Thus the height of the latter rises as the dam goes up, and the switch of the dump track is carried steadily further out and up, in order to preserve the low grade. This arrangement for an easy grade on tracks from a borrow pit which by the nature of its location and making is at a convenient altitude, is effecting a considerable saving of time and expense. Trains of 15 dump cars of 10 cubic yards capacity are hauled from the borrow pit to the top of the dam by a locomotive of the 200 type; and trains from Culebra Cut, consisting of 35 cars of 10 yards each, or 27 cars of 17 yards capacity, are able, with the assistance of a pusher engine, to run intact to all the high level dumps, making up to three switchbacks to accomplish this purpose.

Canal Work in October.

The grand total of Canal excavation to November 1 was 153,055,640 cubic yards, leaving to be excavated 42,267,739 cubic yards, or less than one-fourth of the entire amount for the completed Canal.

The total for October was 2,331,678 cubic yards, as compared with 2,884,382 cubic yards in October, 1910, and 2,827,798 cubic yards in October, 1909.

The dry excavation amounted to 1,516,759 cubic yards, and was principally by steam shovels. The dredges removed 810,215 cubic yards, and 4,704 cubic yards were sluiced in the Central Division, in addition to the amount pumped into Gatun Dam by suction dredges. The progress on the locks at Gatun, Pedro Miguel, and Miraflores is referred to elsewhere in this issue.

In the Atlantic Division, the total excavation was 536,431 cubic yards. Of this total, 66,031 cubic yards were dry excavation, and the remainder was removed by the dredges in the Atlantic entrance.

The total excavation in the Central Division was 1,319,187 cubic yards, all of which was from the prism. The amount taken from Culebra Cut was 1,306,971 cubic yards, as compared with 1,320,314 cubic yards in October, 1910, the high record for that month.

In the Pacific Division, the total excavation was 476,060 cubic yards, 339,815 cubic yards of which were taken out by dredging at the Pacific entrance.

A detailed statement of the excavation, and a summary of the work on the locks and dams, follow:

LOCALITY.	"Work." Excavation.	"Plant." Excavation.	Total excavation.

Mean rainfall along Canal (eleven stations), 13.52 inches.

By "Work" excavation is meant excavation actually made for one of the constituent parts of the Canal, such as prism, diversions, or locks, etc.; that is, it represents material taken from the area to be occupied by the Canal and constitutes excavation useful for the completed Canal.

By "Plant" excavation is meant excavation outside of any of the constituent parts of the Canal, such as prism, diversions, or locks, etc. It includes material necessary to be excavated for construction purposes only, and is chargeable against the particular plant item for which it is performed, such as prism, diversions, locks, etc.

DAM AND LOCK CONSTRUCTION.

Gate Construction at Pedro Miguel.

Backfilling of the western wall of Pedro Miguel locks has been finished to the lower gates and tracks will be laid on the surface shortly in order to give the McClintic-Marshall Construction Company access to the lower gates. The company has ordered a new erection bridge, which will be placed first over the site of the lower guard gates. With its present bridge, the company has been erecting the upper guard gates in both chambers. The fill on the west side required about 50,000 cubic yards. On the east side, a steamshovel has been cutting its way up the knoll between the locks and the Central Division tracks, and will cast material over from it, toward the wall, to make the east backfill.

Monitors Moving toward Pacific.

Hydraulic excavation at the Miraflores lock pit is proceeding southward, in the direction of the Pacific entrance channel. A hydraulic monitor has been placed in front of the barrier of earth which separates the pit from the Pacific and will proceed with its removal. A new cofferdam is being constructed across the channel, a mile to the south but until it is finished a temporary fill across the lowest portion of the flats, several hundred yards below the place the monitor is to work, will prevent flooding. Along the axis of the flats is a channel prism, several feet below the surrounding area, made by the Central Division in former work, which is inundated at high tide. A slight and easily constructed fill across this keeps the whole area dry and allows the monitors to proceed on the upper cofferdam while the new and final one is under construction.

Change in Lighting System.

The lighting system of the Zone villages of Corozal and Diablo was transferred from the Balboa power house to that at Miraflores, on November 3. The Balboa power station, which also supplies all the electric light and power for Balboa, East Balboa and Ancon, was running under an overload of about twenty per cent. The removal of the Corozal-Diablo circuits decreased the load some fifty kilowatts, allowing the plant to run at normal capacity and resulting in noticeable improvement in the lights in all the villages concerned. The Balboa plant supplies alternating current of 60 cycles, while the Miraflores current is of

NOTES OF PROGRESS.

(Continued.)

25 cycles, but as the Corozal-Diablo circuits are practically for lighting alone the change in cycles makes no difference. There are a few small motors on the circuits in private use and these can be used on the new system.

The change is in consonance with plans for permanent light and power throughout the Zone, as the Miraflores plant will be permanent, while it is expected that the Balboa plant will be dismantled within two years. The Miraflores plant is at present operated by the Pacific Division, though the Mechanical Divison has charge of lighting the villages.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is about 71 per cent completed, 161,155 cubic yards, out of a total of 225,000, having been placed at the close of work on November 4. A statement of the amount laid each working day last week, and of the total in place, follows:

Date.	Concrete Laid.	Hours worked.	No. Mixers.
October 30	160	7.30	1
October 31	88	5.00	1
November 1	135	7.00	1
November 2	80	6.00	1
November 3	......	......	......
November 4	160	7.00	1
Total	623	32.30	1
Previously reported	160,532		
Grand total	161,155		

Ancon Crusher.

A statement of rock crushed at the Ancon quarry during the week ending November 4, follows:

Date.	Hours worked.	Cubic Yards.
October 30	7.50	3,091
October 31	6.10	2,437
November 1	5.30	2,317
November 2	7.45	2,685
November 3	Holiday.	
November 4	7.55	2,871
Total	35.10	13,401

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending November 4, follows:

Date.	Hours worked.	Cubic Yards.
October 30	4.20	1,895
October 31	5.30	2,358
November 1	4.30	1,901
November 2	3.15	1,532
November 3 (holiday)	......	......
November 4	4.00	1,813
Total	21.35	9,499

One Hundred Dollar Tourist Rate.

Owing to the small amount of travel by employes, from the Isthmus to the United States during the winter months, and in order that the passenger accomodations on Panama Railroad Company ships may be utilized as much as possible, a rate of $100 for the round trip from New York to Cristobal has been established. The tickets will be good for passage and return on any ships having available accomodations between November 1, 1911 and March 31, 1912. While on the Isthmus, tourists will be maintained at their own expense, the arrangement made by other lines, that passengers may sleep and eat on the ships during their stay in port, not applying on the Panama railroad ships. The ships will make voyages about every six days, according to the schedule published elsewhere in this issue, and they will remain in port on the Isthmus about five days.

Visit of Appropriations Committee.

It is expected that the Appropriations Committee of the House of Representatives will arrive on the Isthmus about November 16, and will remain about one week, during which time the Congressmen will inspect the Canal work and conduct hearings.

CONCRETE WORK IN THE LOCKS.

Over 70 per cent of the concrete for the locks is in place, the amount at the close of work on November 4, being 2,952,215 cubic yards, out of a total of approximately 4,199,400. A total of 25,517 cubic yards of concrete was laid in the locks during the week ending November 4.

GATUN LOCKS.

Over 84 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on November 4 being 1,684,721 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending November 4, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers.			Large stone.	Total.

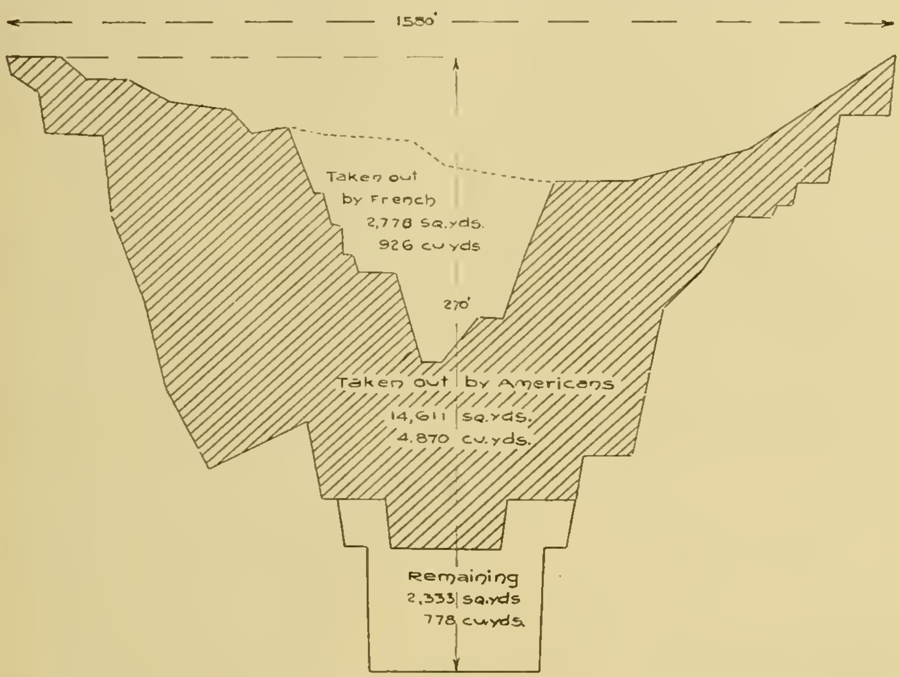
CULEBRA CUT.

Present State of Excavation and Future Plans.

On November 1 there had been excavated from Culebra Cut 70,942,244 cubic yards of rock and earth, and there yet remained 18,501, 761 cubic yards. The average excavation per month during the 12 months just passed has been 1,372,000 cubic yards, and at this rate the work would be completed by January 1, 1913. But this rate cannot be maintained, because sections of the Cut at either end are nearing completion, and the time is approaching when the number of shovels now at work (42) will have to be reduced because of lack of room in which to work and the output must therefore decrease.

The Cut will be completed when the bottom is at 40 feet above mean sea level and 300 feet wide. The table shows the average depth of the lowest cut at each 5,000 feet in the nine miles between Bas Obispo and Pedro Miguel, not counting the drainage ditch which runs the length of the Cut and is necessarily lower than the rest of the excavation.



Entire section equivalent to 6,574 cubic yards per lineal foot of Canal Prism.

CROSS SECTION OF CULEBRA CUT AT CULEBRA WHERE THE TRENCH IS AT ITS GREATEST WIDTH.

Station.	Near Village.	Elevation above sea level, feet
1,480	Bas Obispo	39
1,530	Bas Obispo	39
1,580	Las Cascadas	39
1,630	Las Cascadas	50
1,680	Empire	51
1,730	Empire	88
1,780	Culebra	83
1,830	Cucuracha	60
1,880	Paraiso	40
1,930	Pedro Miguel	39

This table is merely suggestive of the conditions, because the work is done in a series of benches, and the lowest cut is only a single bench, about 40 feet wide, through the center. On the other hand it is typical of the state of completion at each mile, because the excavation proceeds uniformly throughout, with relation to the center line. At Bas Obispo and for a mile at that end of the Cut, the excavation is completed, except for a small amount of cleaning up and the taking out of inclines that must remain for the trains hauling spoil out of the trench on the north side of the summit. At the other end, near Pedro Miguel locks, there remain to be dug out about 800,000 cubic yards, in the canal and the anchorage basin, but this cannot be done until the construction of the north approach and flare walls of the locks has advanced farther. Between that point and Cucuracha there remains about enough digging to keep eight shovels busy for six months more.

By May 1, 1912, the excavation in Culebra Cut will be confined practically to the three miles between Las Cascadas and Cucaracha. On that date there will remain to be excavated about 11,000,000 cubic yards. It is expected that it will be possible to work 30 steam-shovels advantageously in this small section, an average of ten to the mile. This number will be gradually diminished as the excavation nears completion. There is every reason to believe that by July 1, 1913, the digging in Culebra Cut will be completed, except for such small amount of work as will be necessary after the steam shovels are taken out of the Cut. In this, no account is taken of the possibility of dredging of the last 15 feet on the summit of the Cut, but it is assumed that all the work will be done by steam shovel.

It is possible that unexpected developments in the slides at Culebra and Cucaracha will add to the excavation yet to be done, but this need not delay the completion appreciably because if the material continues to move into the Canal after the water is let in it can be dredged more economically than it could be dug out by steamshovel. At Culebra, where the banks on both sides are sliding, the channel is already 1,580 feet wide at top, and the earth is broken so far back on each side that the total width from break to break is 2,000 feet. A cross section of the Cut at this point of greatest width is printed herewith. The height of the picture is exaggerated in comparison with its width, because the horizontal scale is to the vertical as four to one.

EXECUTIVE ORDERS.

Amending Section 10 of Act No. 9, entitled "An Act to provide Sanitary Rules and Regulations for the Canal Zone."

By virtue of the authority vested in me, I hereby establish the following order for the Canal Zone:

Article 1. Section 10 of Act No. 9, entitled "An act to provide sanitary rules and regulations for the Canal Zone, Isthmus of Panama, and for the enforcement thereof," enacted September 2, 1904, is hereby amended so as to read as follows:

Section 10. Every physician, druggist, school teacher, clergyman, midwife, nurse, head of a family, or other person in attendance on or in charge of any one sick or injured, having knowledge of the existence in any district of the Canal Zone of any of the diseases hereinafter named, shall immediately report the same to the District Physician or District Sanitary Inspector. The diseases required to be so reported are: measles, rubella (rotheln), scarlet fever, typhus fever, relapsing fever, typhoid fever, malarial fever, yellow fever, Asiatic cholera, plague, tetanus, anthrax, small-pox, chicken-pox, (varicella), diphtheria, (croup), tuberculosis (of any organ), glanders, epidemic cerebrospinal menigitis, leprosy, infectious diseases of the eye, puerperal septicaemia, erysipelas, whooping cough, dysentery.

Any person who fails to make due report, as required by this order, of any of the above enumerated diseases shall be deemed guilty of a misdemeanor and upon conviction thereof shall be punished by a fine not exceeding $25.00, or by imprisonment in jail not exceeding thirty days, or by both such fine and imprisonment in the discretion of the court.

Article 2. This order shall take effect sixty (60) days from and after this date.

To Prohibit Practise of Medicine, Surgery, Dentistry, Pharmacy, or Midwifery without a License.

By virtue of the authority vested in me I hereby establish the following order for the Canal Zone:

Section 1. It shall be unlawful for any person to practise or attempt to practise medicine, surgery, dentistry, pharmacy or midwifery within the Canal Zone without first having obtained a license therefor from the Board of Health of the Canal Zone. Any person thus offending shall be punished by a fine not exceeding Twenty Five Dollars ($25.00), or by imprisonment in jail not exceeding thirty (30) days, or by both such fine and imprisonment in the discretion of the court; *provided* that this order shall not apply to commissioned surgeons of the United States Army and Navy, or Marine Hospital Service, nor to physicians, surgeons, dentists or pharmacists and their assistants and nurses employed by the Isthmian Canal Commission, nor to nurses acting under the orders of a licensed physician.

Section 2. Any person shall be regarded as practising medicine within the meaning of this order who shall prescribe for, operate on, or in any wise attempt to heal, cure or alleviate, or who shall in any wise treat any disease or any physical or mental ailment of another; *provided* that nothing in this order shall be construed to prohibit gratuitous services in case of emergency, or to the administering of ordinary household remedies.

Section 3. This order shall take effect sixty (60) days from and after this date.

THE WHITE HOUSE. WM. H. TAFT.
October 14, 1911.

STEAMSHOVEL DIPPER TRIPS.

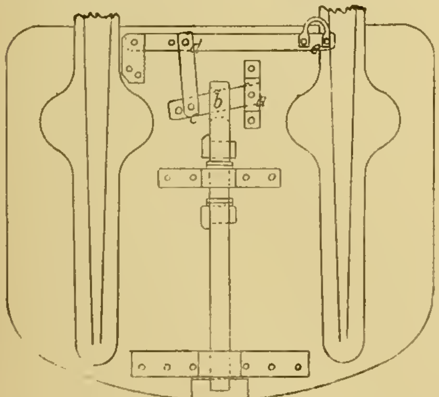
Development of Unlatching Devices from Simple Lever to Steam Power Trips.

An investigation is under way to determine the relative efficiency of the steamshovel "trips," operated by steam, known as the Geddes and Wichman "trips." These are the culmination of a development in the improvement of tripping devices that began soon after the first steamshovels were set at work in Culebra Cut.

In the accompanying sketch (C) the dipper of the shovel is shown in dumping position, the emptying process being accomplished by pulling a latch, by which the door of the shovel is held. When the shovel is ready to dig, the dipper is near the ground with its center back of a vertical line through the center of the shipper shaft, as the shaft of the big gear is called. In this position the door of the dipper closes of its own weight and is latched firmly. When the dipper is loaded, the spoil within it bears down upon the door and tends to hold it so firmly in place that the power required to open the latch is often so great as to cause a serious strain on the craneman, who unlatches the door. Ease in opening the door is an advantage both to the craneman and in accelerating the work of digging. The various improvements on methods of unlatching, or of "tripping" the latch, as it is called, have in view this dual advantage.

When the shovels arrived on the Isthmus they were equipped with a single lever latch operated by a 1¼-inch rope in the hand of the craneman, and attached at its other end to the "trip" of the dipper. Several pulls were often necessary to open the latch, and almost invariably a great effort was required. The string by which this "trip" was operated passed through a sheave on the dipper stick near the dipper and thence to the craneman's hand.

The first improvement was to compound this original "trip," and in the drawing herewith (*A*) the compound "trip" is shown. The original was the simple lever with the fulcrum at (*a*), the weight at (*b*) and the power at (*c*).



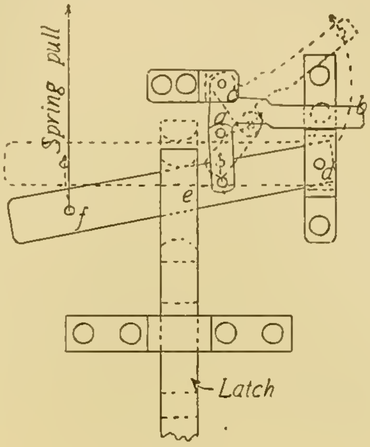
SKETCH A.

DOOR OF DIPPER OF 95 TON STEAM SHOVEL SHOWING COMPOUND LATCH TRIP.

Height of door........................ 4¾ feet
Width................................ 5½ feet

In the compound "trip," another fulcrum was made at (*d*) and the power was applied at (*e*), where the line was attached. By this device a movement of 20 inches in the line resulted in a 1-inch movement of the latch.

Among improvements upon the compound device, one that was given a trial in 1909 was the "spring trip" which consisted of the lever, shown in the second illustration herewith, (*B*) and a bar passing through a slot in the latch, with a spring attached at its outer end, the power for unlatching being supplied by the spring. The rope by which the "trip" is operated is attached at (*b*); the fulcrums are at (*c*) and (*d*); at (*a*) is a toggle joint; at (*e*) the weight; at (*f*) the power applied by the spring. The door is closed by its own weight, when in digging position, placing a tension of 1,300 pounds upon the spring, and drawing the toggle joint erect. When the dipper is in dumping position, the craneman pulls the rope, thereby breaking the toggle joint and allowing the spring to exert its pull upon the latch, which flies back, permitting the dipper to empty. The spring required was of ⅜-inch wire, 31 coils, 2¼-inches outside diameter, and 21 inches long when free. This device worked satisfactorily, but the toggle joint required constant renewing, and some difficulty was experienced in obtaining suitable springs, so that the appliance was finally abandoned.



SKETCH B.

PORTION OF STEAMSHOVEL DIPPER DOOR SHOWING ARRANGEMENT OF SPRING LATCH.

(*a*) Toggle joint. (*b*) Power to break joint. (*c*) Fulcrum of toggle lever. (*d*) Fulcrum of spring lever. (*e*) Weight of latch. (*f*) Power of spring.

The first steam power trip was a device placed upon his shovel by Thomas Custy, a steamshovel engineer, in 1908, but after a few month's trial this was discarded. This device was improved upon by A. H. Geddes, also a steamshovel engineer, until it became practicable, and a patent has been granted to him. It was described at length in THE CANAL RECORD of May 3, 1911. In this device a steam cylinder is located on the dipper stick near the dipper, the piston is connected with the dipper latch through a chain and a series of levers, and when steam is admitted to the cylinder the thrust of the piston operates the levers and unlatches the door. Steam is admitted and exhausted from the cylinder through a three-way valve located on the boom beside the craneman's seat. A steam pipe extends from the valve along the boom opposite the dipper stick slot, and at the end of this pipe, and on the cylinder, are universal joints which are connected with one another by a flexible hose. After a thorough trial this device was adopted, upon the recommendation of a committee of two mechanical experts and a steamshovel engineer, who reported that the capacity of a shovel was increased 100 cubic yards a day by its use.

The latest device, that shown in the illustration, was invented by F. S. Wichman of the Mechanical Division. The latch is opened by a pull that is made on a ½-inch wire rope by the outward thrust of the piston of an air brake cylinder. The mechanism is fixed upon the boom of the shovel. A drum is mounted upon the face of the thrusting gear, or shipper shaft, which revolves with the shaft, thus winding or unwinding the tripper rope, according as the dipper shaft moves up or down. In this way the rope is kept taut at all times. To give the lengthwise pull of the cable, a 6-inch diameter steam cylinder is mounted below the drum. This cylinder has a push piston, the outer end of which is bifurcated to receive a sheave, over which the cable passes on its way to the drum. Steam is admitted to the cylinder, when it is desired to trip the dipper door, through a three-way cock, operated by a lever at the craneman's seat. When the steam exhausts, the spring in the cylinder pulls the piston back into position, and the tripping operation may then be repeated. This device has undergone a successful test on two 95-ton steamshovels.

CONDITIONS AT CAMP OTIS.

Tenth Infantry, U.S.A., in Crowded Quarters at Las Cascadas.

The Tenth Regiment of Infantry, U. S. A., on November 4 completed its first month of service on the Isthmus. The temporary quarters in Camp E. S. Otis, at Las Cascadas, require a great deal of crowding of men and officers and the grounds afford no space for even company formations; no authorization has been made for improvements and no one in the regiment knows whether it is to stay on the Isthmus or is resting over here before making another move. It is the expectation, however, that a few more quarters will be erected shortly, presumably Commission buildings removed from the Gatun Lake area.

One of the new buildings will house the post exchange. This is a combined general merchandise store and clubhouse for the men. The necessaries of wearing apparel, and sutler's supplies are on sale, under a credit system which automatically extends the men's spending period over the month. In the same building are rooms for reading and for cards, billiards and other amusements.

None of the men are quartered in tents, though several of the company messes are under canvas. By direction of the War Department, the regiment obtains its commissary supplies from the Commissary Department of the Panama Railroad Company. Every morning by nine o'clock the mess sergeants give their lists of foodstuffs for a day's provisioning to the regimental commissary, who combines them in a bulk order on the Cristobal store, from which they are delivered the next morning at 6.45 at the regimental storehouse. From this point detachments from the messes take their supplies away on their backs or in wheelbarrows, as the road through the camp is, for the most part, at present impassable for wagons. Some of the messhalls and tents are three quarters of a mile from the storehouse. The regulation Army ration costs here 31 cents per day. At Fort Sam Houston, where the regiment was stationed before its embarkation for the Canal Zone, the day's ration cost 22½ cents per man. The cost of the ration is calculated from the prices prevailing in the vicinity and the mess allowances are made accordingly, the company commander spending as much extra on the mess as he deems wise, from the company fund. On November 4, there were 810 enlisted men present with the regiment, and the aggregate monthly expenditure on their rations is about $8,500.

The sick of the regiment are treated at Ancon Hospital. The sanitation of the camp area is in charge of the regimental sanitary department, which also maintains a dispensary. The camp is well drained and the quarters are screened. The health of the soldiers has been excellent, the few cases of illness being due principally to maldigestion.

Numerous permits are granted for visiting Panama and Colon and the Canal Zone villages. The members of the regiment and their families are given half-rates on the Panama railroad, and avail themselves extensively of the opportunities of observing the Canal construction. At present, on account of restricted grounds, there are no formations, except squad, in rank. Rolls are called in the quarters, the men standing at attention beside their bunks. "Fatigue" duty has provided exercise, and it is hoped shortly to have target practice and service marches. Band concerts are given on Monday and Thursday afternoons at three o'clock and on Wednesday and Saturday evenings at seven-thirty. At these, and at any time during the day, the public is welcome. Of the thirty-five officers present, eighteen have their families with them.

Examinations for Commissions in Volunteer Forces.

Examinations will be held on November 14 at 10 a. m. in the Administration Building, Ancon, to test the fitness of applicants for commissions in the volunteer forces of the United States, in accordance with the law of January 21, 1903 and the General Orders of the War Department, March 25, 1909. The gist of the law and regulations was published in The Canal Record of June 17, 1911. The examining board will consist of Lieut.-Col. Charles F. Mason, Medical Corps, Maj. Joseph H. Ford, Medical Corps, Maj. Charles Gerhardt, Capt. Ethelbert L. D. Breckenridge, and Capt. James J. Mayes, 10th Infantry.

Health Lectures in Three Languages.

The last in the course of free health lectures for the people of Colon, which was instituted last May by the Cristobal Woman's Club, aided by the Department of Sanitation of the Isthmian Canal Commission, was held in the conversorium on Tuesday evening, October 31. The speaker was Dr. J. Tomaselli, of Santa Tomas Hospital, Panama, and the lecture was in French, the audience of more than 400 being composed of members of the French colony of Colon. Stereopticon views showing the progress and development of the tuberculosis bacillus were used. There have been seven lectures in the course; four being in English, two in Spanish, and this last for the French speaking people. The lectures will be resumed after the beginning of the new year.

Baseball.

It has been decided to issue passes to not more than 12 men of each team in the Isthmian Baseball League playing at other than their home grounds, on condition that the League adopt a resolution that no player shall be enrolled as a member of any team who has not been employed by the Isthmian Canal Commission or the Panama railroad for at least six months,an exception being authorized in the case of enlisted men of the Marine battalion stationed on the Isthmus and of the 10th Infantry.

Activities of Various Organizations.

The regular meeting of the Paraiso Woman's Club was held in the lodge hall on Wednesday afternoon, November 1. Following the business session, there was a discussion on club work. A committee has been appointed to arrange for the placing of swings in the school yard. At the meeting on November 15, there will be a program on hygiene and sanitation. The membership of the club is increasing.

At the meeting of the Cristobal Woman's Club on Wednesday, November 1, Mr. James Ten Broeck Bowles gave a talk on garbage disposal. The program was under the home department. Miss Alexander, of the division of schools, will speak on primary education at the meeting under the education committee on December 6.

Hallowe'en entertainments were held last week: in Cristobal by the Union church, at Gatun by the Sunshine Society, at Las Cascadas by the residents for the children of the village, at Empire, at Paraiso, where the Pacific Dancing Club celebrated by a masquerade ball, and at Corozal hall, where a program for the children was followed by informal dancing.

The second monthly meeting of the teachers of the Canal Zone public schools was held in the Ancon school building on Saturday morning, November 2. On the afternoon of the same day Mrs. Maurice H. Thatcher gave a tea and reception to the teachers. There were about 35 present.

On Friday, November 17, the annual bazar of the Ladies' Foreign Missionary Society of the Methodist Episcopal Church, Panama, will be held at Ancon Hall. A feature of this sale will be a large supply of fancy articles suitable for Christmas gifts. The hall will be open both afternoon and evening.

A request has been made for magazines for the prisoners at the stockade at Mandingo River. There are about 120 convicts there at work on the road, the larger percentage of these being English speaking men. Magazines may be sent to the District Quartermaster, Empire, designated for the Mandingo River Stockade.

Zone Contribution to Red Cross.

The following is a copy of a letter received from the Secretary of the American National Red Cross, acknowledging receipt of check for $709.63, the amount raised by the Canal Zone Chapter for the Endowment Fund:

Lieut.-Col. C. A. Devol,
Chairman, Canal Zone Red Cross Chapter,
Culebra, C. Z.

My dear Colonel Devol:

Your letter of September 9, received this morning, enclosing check for $709.63, the amount raised in the Canal Zone for the Endowment Fund. The Canal Zone Committee is one of the first to complete its share.

Very sincerely yours,
Chas. L. Magee, *Secretary.*

Steamboat Inspection Laws.

The law providing for the inspection of all steam vessels navigating the waters of the Canal Zone, promulgated in Executive Order No. 1,386, dated July 21, 1911, goes into effect on Tuesday, November 14. The law was published in full in The Canal Record of August 16, and the final clause of the order provided that it should take effect ninety days after such publication. The general purpose of the law is to prevent the use of unseaworthy vessels, regulate the carrying of passengers, and to avoid accidents resulting from failure to observe the usual rules in handling ships.

The ladder dredge *Gopher*, which has been operated by the Pacific Division in the excavation of sand at Chame, is being overhauled at the Balboa shipyards. Its place at Chame has been taken temporarily by the *Mole*, which will return to its work in the Pacific entrance channel, opposite the shipyards, when the *Gopher* is returned to Chame.

A train of rock will be sent from Culebra Cut to Cristobal every day, there to be dumped on the mole which is being extended from the shore into Limon Bay, as the approach to the system of docks at the Atlantic terminus. The material used up to the present time has been from the borrow pit alongside the railway at Mount Hope.

Fortification Work.

The proposed dock for unloading dynamite at Mindi, at the junction of the Canal and the old French canal, will be built so as to be of use in unloading rock and sand for the fortification work at Toro Point. To accomplish this the plans published heretofore will be changed so that the deck of the dock will be 13 feet above sea level, thus providing for unloading by gravity from cars upon the dock into barges tied up alongside; a standard gauge track will be laid along the face of the dock as close to the front as possible, and a chute will be constructed upon the front of the dock, so as to fold against the face when a ship ties up there, and so fastened that it may follow the fall of the barge in loading.

Lumber and Piling.

Orders recently placed for lumber aggregate about 600,000 board feet.

The Ensiger Lumber Company has been awarded contracts for the following material: 42,875 board feet of yellow pine in pieces 1 by 12 inches, and 2 by 12 inches, and in 30 and 35 foot lengths. This lumber is to be used in making sticks or poles for tamping dynamite, the sticks to be 1, 1¼, and 1½ inches in diameter. Four by four timbers, from 12 to 26 feet long, 55,000 board feet. Four by six timbers, from 12 to 16 feet long, 100,000 board feet.

W. R. Grace & Co. have been awarded contracts for the following materials: Spud timbers for use on dredges, two 36 by 36 inches and 70 feet long; two 24 by 24 inches and 60 feet long; eight 20 by 20 inches and 70 feet long. Creosoted piling for use in the foundation of the wing wall of Miraflores locks, 750 lengths, 40 feet long; 250 lengths, 45 feet long; 500 lengths, 50 feet long; tips of all to be not less than eight inches in diameter.

Yellow pine or Douglas fir boards: 1 by 10 inches, 14, 16, and 18 foot lengths, 50,000 feet; 1 by 12 inches, 12 to 18 foot lengths, 100,000 feet; 3 by 12 inches, 16 foot lengths, 50,000 feet; 4 by 6 inches, 16 to 24 foot lengths, 70,000 feet; 3 by 14 inches, 16 and 20 foot lengths, 5,000 feet; 4 by 12 inches, 22 and 26 foot lengths, 20,000 feet; 6 by 8 inches, 18 and 24 foot lengths, 10,000 feet; 8 by 16 inches, 22 and 30 foot lengths, 130,000 feet.

Work has been begun looking toward the installation at Gamboa, where the construction railroad from Culebra Cut joins the relocated line of the Panama railroad, of a 24 lever mechanical interlocking plant, two power-operated home signals, to govern the movement of trains passing from one system of tracks to the other. The relocated line in this section will be used by trains from Culebra Cut until the excavation north of the summit is completed.

Motor car No. 7, built at Gorgona shops, has been placed in service. It will accomodate seven passengers, has a 40 horsepower gasoline engine, and is capable of running forty miles an hour on level track. It is stationed at Culebra, and at present is used as an inspection car for visitors wishing to see Culebra Cut.

Married.

TUDOR-WHEELER—At Cristobal on October 30, Anna Elizabeth Wheeler of Brooklyn, N. Y., to Walter Pierce Tudor of Empire, Canal Zone, the Rev. A. A. Nellis officiating. Canal Zone residence, Empire.

SMITH-HARRIS—At Empire on November 3, Ina Clytie Harris to Carl Francis Smith, the Rev. A. A Nellis officiating.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The standing of the teams in the Isthmian Basket Ball League on November 4, was as follows:

Team.	Won.	Lost.	P. C.
Cristobal	5	0	1.000
Gatun	4	1	.800
Gorgona	3	1	.750
Culebra	2	3	.400
Corozal	0	4	.000
Empire	0	5	.000

Results of games played on November 4, 1911: Cristobal, 27; Empire, 10. Gatun, 22; Culebra, 20.

Games to be played November 11, 1911.—Cristobal at Gorgona; Corozal at Empire.

COROZAL.

Over 300 people attended the Hallowe'en Entertainment at the Clubhouse. Lingo's orchestra furnished music for the evening. A vaudeville troupe from Gorgona entertained the audience with songs and two short sketches. Mr. King of Miraflores sang three songs. Messrs. Boyd and Jewens were the prize cake walkers. Refreshments consisting of sandwiches, doughnuts, coffee, apples and pop corn were served during the evening.

Eighteen men attended the meeting of the Discussion Club on Wednesday night. The subject for discussion at the weekly meetings during November will be "Sanitation and Hygiene".

CULEBRA.

The results of the bowling games on Saturday night, November 4, were as follows:

Culebra	752	801	864
Gatun	748	763	801

The Gatun basket ball team defeated the local team on Saturday night by the score of 22 to 18. Following is the line-up:

Culebra.	Gatun.
Cushing	Huber
Koperski	Wright
Hepler	Mirinoth
Mitchess	Mitchell, J.
Van Zant	Fitzpatric
Barcroft	
Kenny	

In the local bowling tournament recently finished, S. S. Baumer won the first prize and A. T. Sjoblom the second prize.

A billiard tournament will begin as soon as names of those desiring to play are received.

All men interested in the Thanksgiving bowling tournament should hand their names to the bowling alley manager or leave them at the desk.

EMPIRE.

The following high scores were bowled on the alleys during the past week: Tenpins—Pinney, 214, 202, 221, 204; Parkis, 202, 204; Nelson, 210. Duck pins—Rodeighiro, 101, 103; Pinney, 113, 121; H. King, 102.

Empire took three games from the Gorgona team on Saturday night November 4. Scores were as follows:

Empire.				Gorgona.			
Gustaveson	217	178	167	Arnold	148	124	148
Spinks	179	158	147	Sims	194	191	107
Rodeighiro	192	176	158	Bishop	131	169	140
Pearson	195	246	234	Burmester	125	139	121
Huson	168	172	184	Orr	137	136	157
Total	951	930	890		759	735	673

Pearson's score of 246 for one game and a total of 675 pins for three games are the best scores in this year's tournament. Empire still holds first place in tenpin bowling by again winning the Isthmian tournament.

The preliminaries in the billiard tournament having been played, the standing is as follows: Class A, Messrs. Wood and Hersh; Class B, Messrs. Zinn and Rossiter; Class C, Garrett and Sawtelle. The finals will be played at once.

GORGONA.

Two hundred and fifty people attended a sociable held in the gymnasium on November 1. Hallowe'en games were played, stories told, contests engaged in, and refreshments were served.

J. D. Safford delivered an illustrated lecture on "Alcohol" on the evening of November 2.

At bowling last Saturday night, Gorgona lost three games on the local alleys to Empire, the scores being as follows:

Empire.				Gorgona.			
Pinney	162	204	156	Roper	168	145	138
Giavelli	154	177	148	M. Van	148	141	155
Snyder	134	158	174	Sexton	150	136	156
Davis	141	181	119	R. Van	126	157	155
Parkis	173	175	148	Haggerty	131	155	113
Total	764	895	746		723	734	717

About 120 people were present at the sunset song service last Sunday night. Mrs. R. C. Shady played the piano, E. Reinhold the violin and J. T. Hopkins the cornet.

GATUN.

Gatun won all three games of bowling from Culebra on Saturday evening by the following scores:

Gatun	791	852	743
Culebra	650	659	684

The second meeting of the Drop-in Discussion Club was held immediately after the band concert on Sunday evening. Thirty-two men were present. Among those who spoke were Messrs. Windes, Gilkey, Gayer, Dillon, Christianson, Hastings, and Brown. The subject was "Dangerous and Unsanitary Conditions". The Secretary acted as leader.

Gatun won its fourth consecutive victory at basket ball on Saturday evening November 4, when it defeated the Culebra team by a score of 22 to 20.

A Spanish class will be organized on Wednesday evening November 7. The method will be conversational. No books will be required. The teacher is Senor Jose Gomez.

A mid-week boys' Bible class will be organized in the near future and placed under the direction of the physical director.

A match game of basket ball was played on Saturday evening November 4, between Gorgona's regular team and a scrub team from Gatun. The Gatun players were Rogers, Taylor, Kenney, Hortenstine and Whiston. The score was 41 to 24 in favor of Gorgona. An informal reception with singing was held after the game.

The receipts from the barber shop, pool room, and refreshment counter for the month of October were the largest in the history of the clubhouse.

The membership was increased 26 members during the month of October.

Miss Harris entertained the members on Thursday evening November 2, with piano selections.

Open house was observed on November 3, in honor of the independence of Panama.

CRISTOBAL.

The last games in the Isthmian Ten Pin League will be rolled with the Camp Elliott team on the local alleys on Saturday night, November 11.

In the tournament held on November 3, for the duck pin individual championship of Cristobal, twenty-five men participated. The winners scored as follows: M. A. Smith, 111, 81, 109,-301; C. G. Jaques, 93, 111, 84,-288; F. E. Herrington, 95, 103, 84,-282.

In rolling off the prize for high score between Smith and Jaques, Smith won.

The following high scores were made during the week ending November 4, 1911: Duckpins—Orr, E., 103, 105; Herring, 110; Barrett, 110, 108; Russell, 100; Wheeler, 100, 109; Howard, 105, 104, 107, 106, 102; Marques, 118; Louch, 105, 102; Abernathy, 102; Gibson, 103; Herrington, 103; Jacques, 111; Smith, 111, 109; Harrison, 101. Ten Pins—Gibson, 201, 207, 211, 207, 201; Collins, 206, 202, 209; Louch, 212, 206, 221; Buser, 209, 209; Bullard, 226, 202; Henry, 213, 208; Wallace, 209; Strong, 203.

Wednesday night, November 1st, 223 people attended the motion picture show. The next entertainment in this series will be given on Monday November 13.

The basket ball game between Empire and Cristobal on Saturday night was won by the Cristobal team.

The Bible discussion club on "Social Christianity" will hold its next meeting on Monday evening November 13, from 7.30 to 8.15 o'clock. The topic for discussion will be "Unsanitary Occupation." All men are cordially invited to this forty-five minutes study.

A lecture on "Tuberculosis" will be delivered in the auditorium on Tuesday evening November 14, at 8.15 o'clock, by Dr. J. J. McCormick, assistant health officer, Panama. No admission fee will be charged and the meeting is open to the public.

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending November 8,1911 (75th meridian time):

DATE.	Low.	High.	Low.	High.	Low.
	A.M.	A.M.	A.M.	P.M.	P.M.
November 9		5.00	11.25	5.30	11.45
November 10		5.45	12.10	6.18	
November 11	12.32	6.33	1.00	7.10	
November 12	1.25	7.25	1.50	8.05	
November 13	2.27	8.25	3.53	9.10	
November 14	3.35	9 40	4.05	10.25	
November 15	4.50	11.00	5.20	11.40	

Band Concert.

A band concert will be given by the Isthmian Canal Commission Band at Gorgona, C. Z., on Sunday, November 12, 1911, at 6 p. m.

The next concert will be given at Hotel Tivoli, Ancon, November 19, at 7.30 p. m.

OFFICIAL CIRCULAR.

Acting Division Engineer, Atlantic Division.

CULEBRA, C. Z., October 30, 1911.

CIRCULAR No. 418:

EffectiveOctober 31, 1911, and during the absence on leave of Lieutenant Colonel Wm. L. Sibert, Major Chester Harding will be in charge of the Atlantic Division as Acting Division Engineer.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Sale of Panama Cafe Building.

PANAMA RAILROAD COMPANY,
OFFICE OF GENERAL SUPERINTENDENT,
COLON, R. P., October 27, 1911.

Sealed proposals for the purchase of building located on lot north of Panama passenger station, and known as "Panama Railroad Cafe" building, will be received in this office until 3.00 p. m., November 20, and then opened.

Bids must be made for the building as it stands on the ground, the successful bidder to remove the building within thirty days' time after notified that bid has been accepted.

Proposals should be accompanied by certified check, Post Office money order, or cash, for 5 per cent of the amount of bid, which will be returned to unsuccessful bidders.

The successful bidder will be given a freight rate of $2.25 per ton in case it is desired to ship the material to any point along the line.

Envelopes containing bids should be endorsed: "Proposal for purchase of Panama Railroad Cafe Building," and addressed to

J. A. SMITH,
General Superintendent,
Panama Railroad Company.

Supplies for the Canal.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal and Colon during the week ending November 4:

Prinz Joachim, October 29, from New York, with 267 cases blasting caps, for stock.

Panama, October 30, from New York, with 72 packages locomotive crane parts, 65 kegs bolts, for Atlantic Division; 32 kegs bolts, for Pacific Division; 12 crates steel plant material, 7 cases electrical material, for Mechanical Division; 38 cases drugs and sundries, for Sanitary Department; 27,600 pieces building tile, for Panama Railroad Company; 12 cases castings, 14 cases grindstones, 54 cases salt water soap, 100 cases laundry soap, 100 cases toilet soap, 100 cases sapolio, 100 bales oakum, 490 barrels engine oil, 105 kegs bolts, 22 cases bolts, 14 cases fusees, 10 cases chinaware, 272 bundles steel bars and plates, for stock, and a miscellaneous cargo, the whole consisting of 29,413 packages, weighing 510 tons.

Venus, October 31, from Jacksonville, with 2,289 pieces untreated piling, 35,121 pieces yellow pine lumber, for stock; 395 pieces creosoted piling, for Atlantic Division; 271 pieces cypress lumber, for Mechanical Division.

Atenas, November 2, from New Orleans, with 1,629 pieces yellow pine lumber, for Mechanical Division; 6,738 pieces yellow pine lumber, 75 sacks cotton seed meal, 577 bales straw, 1,272 bales hay, 20 pieces untreated piling, 68 peices creosoted piling, for stock; 1,348 pieces creosoted ties, for Panama Railroad Company.

Santa Marta, November 2, from New York, with 36 drums calcium carbide, for stock.

The following ships arrived at, or departed from the Port of Balboa during the week ending November 4, 1911:

Arrivals—October 30, *Chile*, from Guayaquil; October 30, *Quilpue*, from Valparaiso; October 31, *City of Para*, from San Francisco; October 30, *Urubamba*, from Callao.

Departures—October 30, *Manavi*, to Buenaventura; October 30, *Ucayali*, to Callao; November 1, *Ecuador*, to Guayaquil; November 1, *Aysen*, to Valparaiso; November 3, *Stanley Dollar*, to San Francisco; November 4, *Kansas City*, to San Francisco.

Total		$1,011,061.34			$4,399,772.00			$5,410,833.34	
LaBoca Locks and Dams—(abandoned)									
59 Dry excavation				78,233	$158,343.29	2.0240	78,233	$158,343.29	$2.0240
60 Construction, dam					315,350.07			315,350.07	
61 Construction, locks					159,306.40			159,306.40	
Total					$632,999.76			$632,999.76	
62 Naos Island breakwater		$667.27			$58,106.06			$58,773.33	
Total construction cost, Pacific Division		$2,045,679.84			$18,821,846.72			$20,867,526.56	
63 Plant and equipment to absorbed in construction costs after Sept. 30, 1911								$2,520,118.04	
Total expenditures, Pacific Division								$23,387,644.60	
Lighting and bouying canal		$18,603.87			$14,374.88			$32,978.75	
Total expenditures, constr. and engr'n'g								$129,990,075.44	

Item 27—*Colon Breakwater.* Figures shown include fill from Toro Point and large rock from Porto Bello.
Item 31—*Dredging Excavation, Prism.* Preliminary surveys.
Item 33—Operation of cement gun used in facing walls of Cut.
Item 36—*Dredging Excavation, Prism.* With the accounts for the month of April the total cost of the dredging plant had been absorbed into the work, hence no abitrary for plant is charged in this quarter.
Item 47—*Miraflores Dams, Hydraulic Filling.* Expenditures represent cost of pipe lines, flumes, etc. 639,098 cubic yards havebeen deposited in dams from dredging and hydraulic excavations in lock chamber and in the prism below the locks, the total expenditures therefor being charged to "Excavation".
Items 59, 60, and 61—These expenditures were incurred prior to the adoption of the Miraflores as the site for the lower locks and dams, at the Pacific entrance of the canal.
Items 28, 34, and 63—*Plant.* The expenditures for plant and equipment are absorbed into construction costs on the basis of estimated total cost of Plan and the estimated quantities of work to be done. The amounts shown under these items represent the balances which are to be absorbed into construction costs after September 30, 1911
General—When excavated material is used in filling, such as dams, back filling, etc., the cost of dumping only is charged to the items benefited, all other expenses be charged to "Excavation".

DAM CONSTRUCTION.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, NOVEMBER 15, 1911. No. 12.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Dredge Corozal Accepted.

It has been decided to accept the 1000-yards-an-hour ladder or elevator dredge *Corozal*, upon the report of the test it has undergone in Scotland. This is the dredge built on the Clyde for excavation in the Pacific entrance of the Canal and for maintenance work.

Erecting Lock Gates.

The work of erecting the upper guard gates in the twin locks at Gatun has been completed and the riveting on these gates is about fifty per cent finished. The gates will probably be hung and swung back against the walls in December, at which time they will be entirely completed, except for putting a concrete walk, with handrail, on top of each, and making the final adjustments and connections for the electric operating machinery. The gate erection now underway at Gatun is that of the upper operating gates, both flights.

At Pedro Miguel, the upper guard gates in both chambers are 80 per cent in place, and the upper operating gates in the east chamber about 35 per cent. A new erection bridge and a new crane, for the McClintic-Marshall Construction Company, have arrived, and will be placed over the location of the lower operating gates at Pedro Miguel. When the bridge and crane now in use at Pedro Miguel have completed their work on the upper operating and guard gates they will be moved to Miraflores, leaving the rest of the gate construction at Pedro Miguel to be done with the new bridge and crane.

On November 1, of the 50,000 tons of structural iron required for all the gates of the canal, 15,000 tons had arrived on the Isthmus and 3,000 tons had been erected.

Nombre de Dios and Chame Sand Service.

Sand dredging at Nombe de Dios will be discontinued about November 15. The storage pile at Gatun, which contains about 80,000 cubic yards, will be left full, and when sufficiently depleted a suction dredge and barges will be returned to the excavation area to restock the storage pile. It is estimated that only one such restocking will be necessary and that if the pile is full on July 1, 1912, it will contain enough sand to finish the concrete work at Gatun. The 18-inch suction dredge which has been excavating sand at Nombre de Dios, will be set at work between Mindi and the lower end of Gatun Locks. Its greatest monthly output of sand amounted to 47,885 cubic yards and was in March, 1911.

The Pacific Division will furnish hereafter, from the pit at Chame, all of the sand for all divisions except the Atlantic, for the Panama railroad and the relocation, and for sale to private parties. The Pacific Division is now using about 45,000 cubic yards of sand a month. The excavation at Chame is made by the ladder dredge *Gopher*, now temporarily supplanted by the *Mole*, while undergoing repairs at the Balboa shipyards.

Pedro Miguel Locks.

The laying of the foundation for the upper center wall of Pedro Miguel locks has advanced to within 130 feet of the upper end. Old steel rails, embedded in the concrete in a vertical position, provide the reinforcement at this stage. Steamshovel 50 is at the upper end of the wall site, excavating for the continuance of the foundation.

A locomotive crane, equipped with an orangepeel bucket, is excavating residuum at the lower end of the east side wall, in preparation for the erection of the wing wall at this point. Besides this, there remains no further excavation at this end of the locks, except for the removal of the railroad embankments, on which lie the tracks to the west backfill and dam.

Atlantic Terminal Docks.

About twenty per cent of the structural steel for the caissons of the Atlantic terminal docks has arrived on the Isthmus and the remainder is to be here by the first of January. The steel is received in flat sheets, and rolled and riveted in 5-foot sections at the Cristobal boiler shop.

Thirteen caissons have been sunk to bedrock and filled with concrete at pier 16. At pier 17, eight caissons have been set and sunk to depths varying between 25 and 55 feet below mean sealevel.

The trestle of the mole, which is to extend across the inshore ends of the piers and carry the railway tracks to them, has been extended 1,300 feet from the shore and a fill to mean sealevel extends 550 feet from shore. The end of the mole trestle is to be built 420 feet farther.

Tidal Data for Pacific Entrance.

In an examination of tidal data, compiled during the time of the French Canal companies and now on file in Washington, records were found recently that appear definitely to connect the Naos Island tide gauge with one that was established at Balboa. If such connection can be established reliably it will permit the use of over five years continuous records from the Naos Island station that have not been available up to the present time. The work of establishing this connection has been authorized. The additional data will be of value in a more definite determination of mean sea level at both the Atlantic and Pacific entrances to the Canal, and in the determination of what tidal changes, if any, have already taken place or are in progress on account of the construction of the Pacific breakwater, the deepening of the channel in the Bay of Panama, and the changes that have been made in the basin of the Rio Grande above Balboa.

Sale of Buildings in Lake Region.

The sale of 65 Canal buildings in the Gatun Lake region, advertised for October 28, resulted in satisfactory bids being received for 47 of them, the total of the bids being $3,052.75. The few structures yet remaining in the villages of Bohio, Tabernilla, and San Pablo will be disposed of at private sale, or will be demolished and the material used elsewhere. The purchasers under the recent sale were as follows:

H. A. Jacobs, Empire, five buildings at San Pablo, $460; Panama Republic, one at San Pablo and two at Tabernilla, $335.00; D. J. Gordon, Empire, one at San Pablo, $40; George Clarke, Gatun, one at Bohio, $40; E. B. Thornton, Empire, 12 at San Pablo, $568; H. J. Wempe, Cristobal, four at Tabernilla, $435; Fred Reuben, Culebra, two at Tabernilla, $30; T. F. Robertson, two at Bohio, $80; Frederick Samuels, one at Tabernilla, $3.00, R. C. A. Cadogan, Colon, one at Tabernilla, $95; E. Sardi, Bohio, two buildings at Bohio, $50; Anthony Guardiola, one at Tabernilla, $45; A. W. Piper, Las Cascadas, four at Tabernilla, $308; C. B. Thaxton, Cristobal, two at Tabernilla, $102.25; J. A. Gordon, Empire, two at San Pablo, and one at Tabernilla, $105; J. Von Redhead, Las Cascadas, one at Tabernilla, $15; P. Canavaggio, Colon, one at Tabernilla, $126; Mezele Gustave, Empire, one at San Pablo, $125.50. Of the total of 47 buildings sold, 5 are situated at Bohio, 20 at Tabernilla, and 22 at San Pablo.

In all there have been sold in the region between Gatun and Gorgona, the section that will be flooded by Gatun Lake, since January 1, upwards of one hundred buildings from which over $4,700 has been realized. About 90 per cent of these were structures included in the purchase from the French. Many of them had been repaired, fitted with new roofs, and made to serve as quarters for the American Canal employes, while a few were not used by the Americans, but merely sold at the best price obtainable. The buildings recently sold will be removed between now and January 1, 1912. Most of them will be rebuilt at hamlets along the relocated line of the railroad, others will be set up in the jungle on tracts leased from the railroad or Commission, and a few

NOTES OF PROGRESS.

(*Continued.*)

will be removed to Panama and Colon for use in buildings there.

It is the aim to have all the lake region between Gatun and Gorgona cleared of buildings before the present line of the railroad is taken up because otherwise the hamlets would be isolated. The railroad will be taken up during the coming dry season (January to May) by the end of which the excavation in progress at Bohio and San Pablo will be completed. All this clearing of the lake region is incident to the rise of the water in Gatun Lake, which will take place as soon as the dam in the spillway of Gatun Dam is raised to 50 feet above sea level, which likewise will be accomplished during the coming dry season. One year hence the water in the lake will be at 55 feet above mean tide, within 30 feet of its final height.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is about 72 per cent completed, 161,667 cubic yards, out of a total of 225,000, having been placed at the close of work on November 11. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
November 6	140	6.30	1
November 7	42	3.30	2

Central Division Unloaders.

Lidgerwood cars were unloaded on the Central Division dumps during the month of October, as follows:

LOCATION.	No. of unloaders.	No. of trains.	No. of cars.
Balboa	3	974	19,480
Miraflores	3	636	12,720
Gamboa	*4	1,030	21,630
Total	10	2,640	53,830

*1 unloader worked from 1st to 9th only.

Visit of Congressmen.

A party of Congressmen and members of their families, comprising in all thirty-five persons, sailed from New York for the Isthmus on the Panama railroad steamship *Cristobal* on November 9, and are due to arrive at Colon on Thursday, the 16th. There are sixteen Congressmen in the party, nearly all of whom are members of the Appropriation Committee. The sailing list is as follows: Congressmen, Fitzgerald, wife and two sons; Burleson, wife and daughter; Johnson and wife; Page and wife; Saunders and wife; Byrns and wife; Kinkead and wife; Good and wife; Sherley, Rauch, Sisson, Cannon, Gillett, Malby, Foster and Webb. The party includes also Secretary Courts of the Appropriation Committee, Mr. Smith, Clerk of the Committee, and three stenographers, and the secretary to Representative Fitzgerald.

CONCRETE WORK IN THE LOCKS.

Over 70 per cent of the concrete for the locks is in place, the amount at the close of work on November 11, being 2,979,489 cubic yards, out of a total of approximately 4,199,400. A total of 27,274 cubic yards of concrete was laid in the locks during the week ending November 11.

GATUN LOCKS.

Over 84 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on November 11 being 1,695,238 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending November 11, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

AIR AND WATER SERVICE.

Method by which Drills and Steamshovels in Culebra Cut are Supplied.

Without water the steamshovels could not operate, and without compressed air it would be necessary to have a fire in each of the boilers of the 130 well drills working in Culebra Cut. But compressed air is used for both the well and the tripod drills, and like the water for the shovels it must therefore be supplied. This dual supply would be a simple matter if the shovels and drills remained in one place, but they are constantly moving forward, while as the excavation advances the elevation at which they work also changes. An indispensable part of the digging of Culebra Cut, therefore, is furnishing a constant supply of water and compressed air, and this duty is assigned to a special section of the Central Division organization, which does no other work.

Water is supplied from the reservoirs at Rio Grande and Camacho, and the pumping stations at Bas Obispo, Lirio, La Pita Point, Gamboa, and Dump No. 5 on the relocation of the Panama railroad, air from the compressor plants at Rio Grande, Empire, and Las Cascadas. A common method is used in distribution.

Culebra Cut is, roughly speaking, 8½ miles long. Across the south end, at Paraiso, runs the Panama railroad trestle, across the north end is the dike that guards the cut from flooding by the Chagres River, while about midway between these two points the suspension bridge at Empire spans the canal. A parallel system of air and water mains, 6, 8, and 10-inch pipes, runs along each side of the Cut, and the mains are connected by way of the trestle, dike, and bridge referred to, making a complete circuit around the 8½ miles of excavation, with a connection half way. At regular intervals, usually about 1,500 feet, are gate valves by means of which the water or air may be shut off from any section of the circuit, without cutting the supply off from the remaining sections. At intervals of 500 feet lateral mains of 2, 4, and 6-inch pipe run from the supply mains over the edge of the Cut. These likewise are supplied with gate valves, and at their free ends are connections to which pipe or hose can be attached to carry water or air to the shovels or drills.

In all there are 181,200 linear feet, or 34.31 miles of 6, 8, and 10-inch air and water mains in use; and 45,300 feet or 8.6 miles of lateral drop pipes. An average of over 400,000 linear feet, 75.7 miles, of supply pipes to the drills and shovels from the lateral drops is taken up and relaid monthly. To keep the service in working order, the Superintendent of Municipal Work and Pipe Lines has at his order 218 men, including one general foreman, seven foremen, and two steam engineers, all Americans on the gold roll, and the following silver roll men: Pipefitters, 62; pipefitters' helpers, 70; carpenters, 4; laborers, 54; messengers, 4; clerk, 1; watchman, 1; stationary engineer, 1; foremen, 8; oilers, 2; waterboy, 1.

Day and night some men of this force patrol the edges of the Cut looking for leaks, breaks, and evidences of such movements in the banks as may result in breaks or in forcing a removal of the mains to other positions. In addition all the workers of both the night and day forces report mishaps of any character, and thus the the Superintendent at Empire is kept informed of the location of trouble. The "trouble" work is in addition to the regular work of changing pipes as the shovels and drills move forward.

One night recently a portion of the bank on the east side of the Cut opposite Culebra slid into the Canal carrying with it a section of the mains from which water was supplied to half a dozen steam shovels near Gold Hill, and air to a battery of drills. Within half an hour after the break was reported the repair gang was at work. It was not possible to restore the mains at once, so the gate valves on either side of the break were closed, and pipes were laid from the mains on the west side of the Canal, across the bottom of the Cut—through the Culebra slide, over ditches, and under railroad tracks—to the shovels and drills. It was after midnight when the break occurred, yet water and air were available at 7 o'clock that morning and the shovels and drills began work on time. It took a week to restore the mains.

One of the frequent causes of moving the mains are the slides. At Culebra the gradual breaking away of the bank made it necessary a few months ago to move back both the air and water mains a distance of several hundred feet from the edge of the Cut. A similar removal was necessary at Cunette, near Empire, a year ago, and several smaller shifts have been made on the east bank on account of slides. Such changes as these amount to taking up and relaying whole sections of the mains; yet on account of the system of two complete circuits maintained, these removals have never delayed the work.

Two months of the dry season and two of the wet season have been taken to indicate the amount of work that must be done in this branch of the Culebra Cut service in order to keep the excavation force from delays due to waits for water and compressed air. The number of feet of pipe installed and moved during January, February, August and September is as follows:

Months.	Installed lin. feet.	Moved lin. feet.	Total lin. feet.
January	503,620	447,020	950,640
February	454,860	423,130	877,990
August	445,510	424,320	869,830
September	400,710	370,620	771,330

These figures include a small amount of work in the Chagres section.

An analysis of the work done in September, as regards the size of pipe installed and removed, follows, figures being for Culebra Cut only:

Size of Pipe.	Installed lin. feet.	Removed lin. feet.	Total handled lin. feet.
¾ inch	4,930	1,910	6,840
1 inch	168,400	146,380	314,780
1¼ inch	5,580	5,160	10,740
1½ inch	21,060	17,640	38,700
2 inch	156,520	159,170	315,690
2½ inch	32,840	30,960	63,800
3 inch	7,040	5,380	12,420
4 inch	1,540	1,760	3,300
6 inch	2,540	1,700	4,240
10 inch	260	560	820
Total	400,710	370,620	771,330

The concrete buttresses for the cofferdam erected on the caisson sill at the lower end of Gatun Locks will be sixty days old about the middle of December, and by that time the facing of the cofferdam will be finished. Suction dredges will then proceed with the removal of the earth dike in front of the locks, which now protects the lower chambers from inundation. It is planned to continue the construction of the side walls up to sea-level, placing bulkheads in the culverts to prevent their being flooded.

STEAMSHOVEL RECORDS.

Work in Culebra Cut and on P. R. R. Relocation.

During the month of October the total amount of material excavated in the Central Division was 1,322,588 cubic yards, of which 189,482 cubic yards were classified as earth, and 1,133,106 cubic yards as rock.

Of this quantity 1,309,752 cubic yards were removed by steam shovels, 620 cubic yards by bucket crane, contractors removed 4,704 cubic yards by sluicing, and 7,512 cubic yards by hand.

The high record for the month was made by Shovel No. 224, working 25 days in the Culebra District, which excavated 46,657 cubic yards of rock.

The second best record for the month was made by Shovel No. 254, working 20½ days in the Culebra District, which excavated 45,887 cubic yards of rock.

The best record for a shovel of the seventy-ton class was made by Shovel No. 109, working 24 days in the Culebra District, which excavated 29,362 cubic yards of rock and earth.

Shovel No. 223, working in the Culebra District, made a high record for one day by excavating 3,219 cubic yards of rock on October 7.

Except where noted, monthly reports are computed by place measurement, while the daily reports are based on car measurement. The best records for the month and for one day are shown below:

BEST RECORDS FOR THE MONTH.

EMPIRE DISTRICT.

Shovel No.	Cubic Yards. Earth.	Rock.	Total.	No. of days at work.
215	17,900	17,849	35,749	26
210		34,538	34,538	26
226		33,116	33,116	26

CULEBRA DISTRICT.

Shovel No.	Earth.	Rock.	Total.	No. of days at work.
224		46.657	46,657	25
254		45,887	45,887	20½
207		43,740	43,740	26

PEDRO MIGUEL.

Shovel No.	Earth.	Rock.	Total.	No. of days at work.
122	24,786		24,786	26

BEST RECORDS FOR ONE DAY.

Shovel.	Location.	Date.	Character of material excavated.	Cubic yards.
205	Empire	Oct. 23	Rock	2,500
205	Empire	Oct. 21	Rock	2,260
232	Empire	Oct. 9	Rock	2,225
223	Culebra	Oct. 7	Rock	3,219
207	Culebra	Oct. 2	Rock	3,177
254	Culebra	Oct. 11	Rock	2,679
122	Pedro Miguel	Oct. 6	Earth	1,520

Relocated Line of Panama Railroad.

The total steamshovel excavation on the relocated line of the Panama railroad amounted to 367,085 cubic yards.

The best month's record was made by steamshovel No. 257, working on the Gatun section, which excavated 59,220 cubic yards of solid rock.

In the 70-ton class, the best month's record was made by steamshovel No. 128, working on the Gatun section, which excavated 33,280 cubic yards of earth and 8,000 cubic yards of solid rock, a total of 41,280 cubic yards.

The best day's record for shovels with 5-yard dippers was made by steamshovel No. 257, which excavated 3,380 cubic yards of rock on October 10.

The best day's record for shovel with 3-yard dippers was made by steamshovel No. 128, working on the Gatun section, which excavated 1,900 cubic yards of earth on October 3.

Month's records are by place measurement, and day's records by car measurement. All material was loaded in 10-yard dump cars.

BEST RECORDS FOR THE MONTH.

SHOVEL No.	Location.	Cubic Yards by Cross Section.			
		Days worked.	Earth	Rock.	Total.
257	Gatun....	22	....	59,220	59,220
128	Gatun....	26	33,280	8,000	41,280

128	Gatun......	Oct. 5	Earth...........	1,900

Total steam shovel output during the month of October, 367,085 cubic yards.
Total number of steam shovel working days, 270.
Average output per working day, 1,360 cubic yards.

Half-rate Transportation for Employes.

The Panama railroad is preparing to sell mileage books to employes of the company and of the Isthmian Canal Commission at the rate of 2½ cents a mile for first class carriage. The books will be issued in 200 and 400 mile form, at $5 and $10 respectively, and in the case of the head of a family will be good for use by the holder and dependent members of his family. Two hundred and fifty pounds of baggage may be carried for each book. The books will be on sale at the stations of the railroad for cash, it having been decided not to use the deduction from salary system. The present system of issuing half rate tickets to employes will be discontinued as soon as the new system is put into effect.

Second class carriage will be regulated by the terms of the following circular:

CIRCULAR No. 401:

Effective December 1, 1911, the issuance of second class half-rate requests, and the sale of second class half-rate tickets, will be discontinued. A flat rate of two cents per mile will be granted all second class passengers and revised passenger tariff covering is now being prepared.

J. A. SMITH,
General Superintendent.

Pilots, Mates, Masters, Engineers, Chauffeurs.

Examinations for pilots, mates, masters and engineers; and for chauffeurs, will be held by the Board of Local Inspectors at the Administration Building, Ancon, on November 22, 1911. All applicants for licenses as chauffeur must secure from the Department of Civil Administration, Executive Office, Ancon, forms of application, and information respecting the filling out of the same, not later than the day previous to the examination. All applicants for examinations must be present at the Administration Building at 8.00 a. m. on November 22, with papers in proper form. In addition, applicants for chauffeurs' licenses must demonstrate their capacity properly to operate an automobile, and must have the automobile with them.

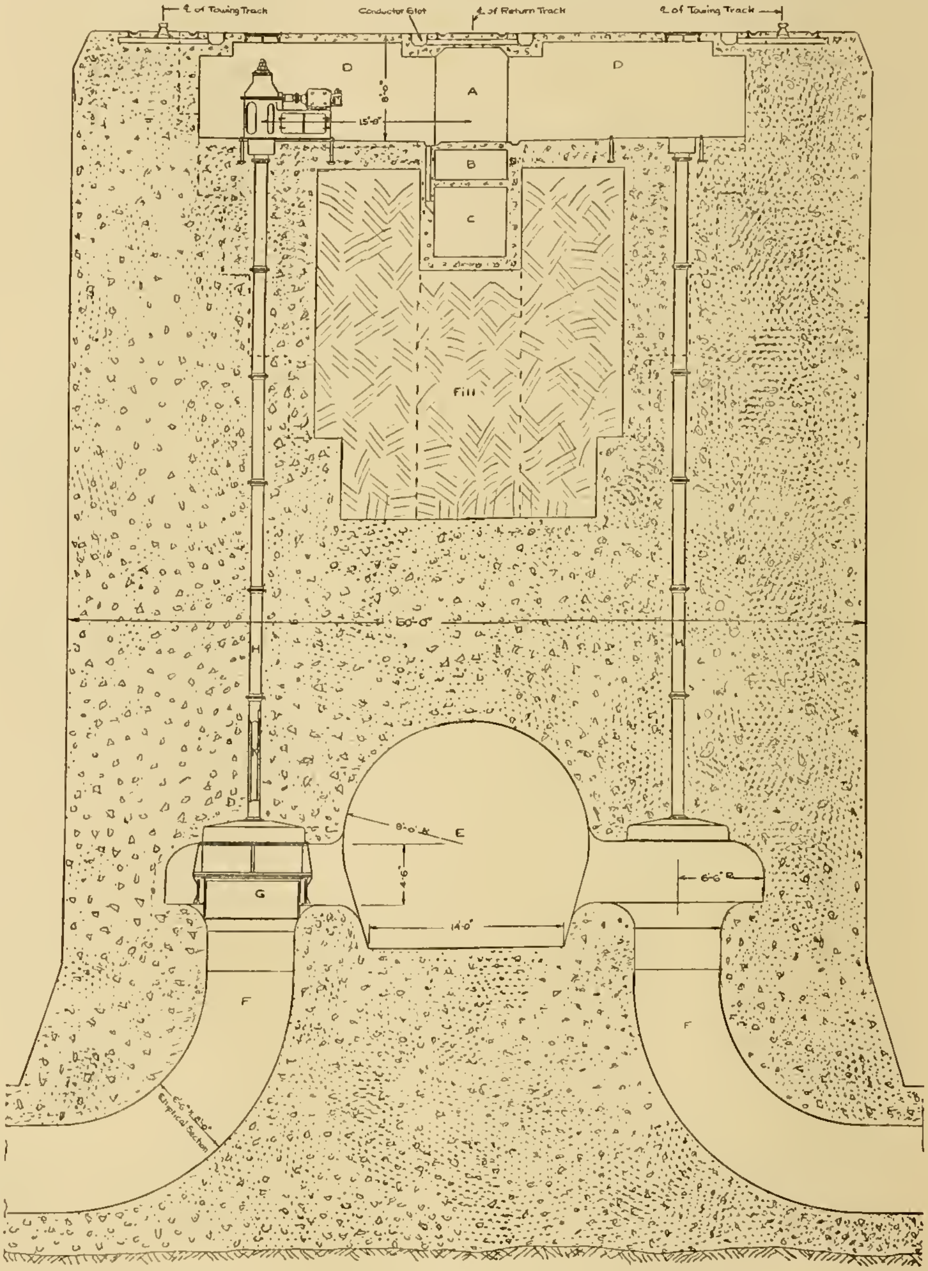
The steamship *Leelanaw* arrived at the port of Balboa on November 10, from San Francisco, towing the ship *Babcock*, with a full cargo of wine and barley for New York.

CYLINDRICAL VALVES.

Installation of Valves and Operating Machines.

The work of installing the first of the cylindrical valve machines in the locks was begun at Gatun last week and will probably be finished this week. This is the machine for valve No. 559, which is in the center wall of the upper locks at Gatun, and closes one of the 30 openings from the center wall culvert into the lateral culverts of the three west lock chambers. The number indicates only position, because in all there are only 120 of these valves in the locks—sixty at Gatun, twenty at Pedro Miguel, and forty at Miraflores. The object of the valves is to control the flow of water from the center wall culvert into the lateral culverts beneath the floor, whence it rises through wells in the floor into the lock chamber. This control is necessary in the case of the center wall culvert, in order that the twin chambers may be used independently of one another. In the side wall culverts the flow of water is regulated by gate valves in the culverts themselves, and there are no cylindrical valves controlling the flow through the lateral culverts.

In the accompanying sketch (A) the position of the valves and the machines that operate them is shown with relation to the center wall culvert. The valves themselves are embedded in the concrete during the construction of the wall, an opening being left for the rising stem, and the chamber for the machine also being left open at the top until the machine is installed, after which the decking of reinforced concrete will be laid. After they were placed some of the valves underwent tests, all of which were satisfactory, and the machine now being installed also passed its test at the plant of the manufacturer in Wheeling, W. Va., in October. It is proposed



SKETCH A.

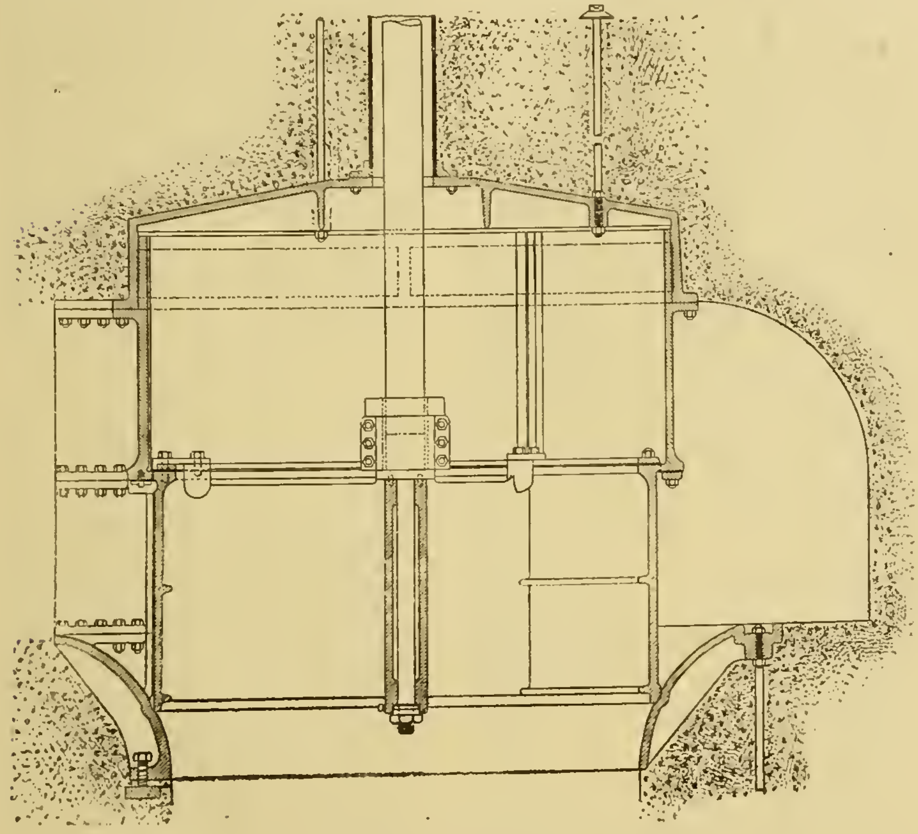
TYPICAL SECTION OF CENTER WALL OF LOCKS AT CENTER LINE OF CYLINDRICAL VALVE.

A—Machinery Operating Tunnel. B—Duct Space. C—Drainage Tunnel. D—Cylindrical Valve Machinery Chamber. E—Main Culvert. F—Lateral Culvert. G—Cylindrical Valve. H—Valve Stem Casing. K—Valve Stem.

now to test both the valve and machine in place.

Valves—The valves consist of two concentric hollow cylinders, one stationary and the other movable. The opening is closed when the movable cylinder is in its lowest position, at which time the upper end of the movable cylinder comes in contact with a leather washer making a seal; simultaneously the lower end is pressed against a turned metal surface, known as the valve seat.

In the accompanying illustration (B) a section through a valve is shown. The upper cylinder is fixed and in it moves up and down the lower cylinder, in harmony with the impulse of the screw or stem. When the valve is closed this movable cylinder presses against the seat in the fixed casting at the bottom of the valve chamber, thus making a watertight seal. The opening from the center culvert to the valve chamber is approximately rectangular in shape, 4½′ X 13′-0″. When the valve is entirely open the moveable cylinder is within the fixed cylinder, leaving 2 feet 1½ inches opening completely around the valve for the flow of water. The diameter of the moveable cylinder is 7 feet 1⅜-inches, that of the culvert below the valve 6½ feet, for two feet below the valve seat, changing at a point three feet lower into an elliptic whose major axis is 8 feet and minor 6 feet 6 inches. This elliptical culvert extends across the lock chamber under the floor.



SKETCH B.

SECTION THROUGH CYLINDRICAL VALVE.

Diameter of outlet from central culvert 4½ feet; of outlet under valve 6½ feet; of movable cylinder of valve 7 feet 1⅜ inches.

Valve Machine—The stem by which the movable cylinder is raised or lowered, in other words by which the valve is operated, passes through a stuffing box mounted upon the upper end of the valve stem casing, which is bolted to the fixed cylinder and thence through a metal casing to the operating machine, as shown in sketch (A.) At its upper end the stem has fastened to it a non-revolving nut. This nut, and hence the valve and valve stem, is moved vertically through a distance of 3 feet by means of a revolving screw, the end thrust being taken up by a roller bearing at the upper end of the screw. The screw is actuated by a bevel gear, which is driven by a pinion on an extension of the motor shaft. A combination casing and bedplate carries the motor, limit switch, bearings, and all moving parts. A small oil pump geared to the motor shaft lubricates the thrust bearings, and motor shaft extension bearings. When the valve reaches its seat, shock to the machinery is prevented by allowing the thrust screw to rise through the thrust sleeve, giving the motor time to stop without shock.

A test of two of the cylindrical valve machines, including that now being installed, with the motors and limit switches, was made at the plant of the manufacturer, under the direction of a representative of the Commission, during September and October. For this purpose the machines were mounted in position similar to that they will occupy in the locks, and they were operated under various conditions with weights of 9,000 and 14,000 pounds. After preliminary tests to check alignment, the fit of various parts, and the strength of the testing platform, the machines were operated through 100 cycles at intervals of from one to three minutes with four different motors and limit switches. In each instance the machine operated satisfactorily and in accordance with the specifications. Two kinds of lubricant were used. Turbine oil proved so light that it was thrown or squeezed out by the centrifugal pressure so that a heavier oil was substituted. The results of the test for machine No. 559 were as follows:

	Up 9000 lbs	Down 9000 lbs	Up 1,400 lbs.	Down 1,400 lbs.
Stroke.......	36 ins.	36 ins.	35⅛+1⅞ in.	35⅛+1⅞ ins
Time........	....	....	11.4 sec.	9.4 sec.
Running torque.......	86	....	112	....
H. P. at coupling.......	10.8	....	13.0	....
Amperes.....	34	18.5	44	20
K. W. at motor term'als	10.9	*0	14.1	-1.27
Machine efficiency*....	....	....	*51.5 p. c.	....

*Efficiency, is the ratio of energy input to the motor, divided by actual energy output. This accounts for both electrical and mechanical losses.

Washington Hotel Sea Bath.

Work is nearing completion on the sea bath that will form part of the equipment of the new Washington Hotel now in process of construction on Colon beach. As soon as the bath and its houses are completed, it will be opened to the public. Canal and railroad employes, and guests of the Washington Hotel, not using the dressing rooms will be charged 5 cents for the use of the bath, and those using the dressing rooms will be charged 25 cents, which will include the use of a shower bath and towels. There will be ten bath houses for each sex, each house being for one person.

The swimming pool is 125 by 100 feet, and from 3 to 9 feet deep. It is open on the sea side so that there is a continual change of water.

Family Quarters for Tenth Infantry Officers.

The War Department has authorized an additional expenditure of $25,000 from the "barracks and quarters" appropriation, for the construction of suitable quarters on the Isthmus for the families of officers of the 10th infantry. At present the families of the officers are housed in very inadequate quarters at Camp Otis near Las Cascadas.

Work has been begun on the removal of buildings from Tabernilla and San Pablo, and when they are re-erected at Camp Otis there will be suitable quarters for 45 officers. The Commission hotel at San Pablo will be moved to the camp and run as a post exchange. In all $50,000 has been apportioned for the barracks and quarters at Camp Otis.

Electrical Engineers.

Word has been received from the United States that a party of members of the American Institute of Electrical Engineers, numbering about 120 persons, will arive at Colon on January 25 and will leave for the States on February 1. The midwinter meeting will be held here and informal meetings will be held on board the ship both coming to the Isthmus and returning to the States.

Stamps in Books.

Books of stamps, with the gummed side shielded by paraffine paper, will presently be on sale at the Canal Zone post offices. Only two cent stamps will be sold, and these in books of 12, costing 25 cents, and 24, costing 49 cents.

In the street improvements in the city of Panama, in the area bounded by Fourth of July Avenue and the Balboa Road, and lying west of Sixteenth Street, 1,400 feet of sewer pipe has been laid and covered on Ancon Boulevard, between the Balboa Road and a point south of the National Institute. Laterals are being laid from this main and the laying of water mains has begun.

SOCIAL LIFE OF THE ZONE.

Salvation Army.

The dormitories of the new building of the Salvation Army Social Institute in Cristobal were opened this week with 86 beds, this being an increase of 12 over the number in the building destroyed by fire in March. Since the opening of the present building in September, 100 meals on an average have been served daily in the restaurant. The Commission has granted to the army the site occupied by the old building where a hall for holding services will be erected. A request has been made for permission to erect a building similar to the one now in use for institutional work in Panama.

On Monday, November 13, Commissioner Richards, of the South African forces of the Salvation Army, and Col. Sydney Maidment, of the West Indies and South American Division, arrived on the Isthmus for an eight days' visit. During the week meetings have been held in the Wesleyan churches in Colon, Gatun and Panama, and in St. Andrews church, Gorgona, by courtesy of the Commission and of the superintendents of the congregations. On Monday, November 20, Colonel Maidment, accompanied by Adjutant Catlin, head of the work for Panama and the Canal Zone, will leave for a visit to Bocas del Toro, Port Limon, and other points, and Commissioner Richards will return to England.

Benefit for Widow of Captain Hammond.

The following letter is published for the information of subscribers to the fund for the benefit of Mrs. Edwin D. Hammond:

EMPIRE, C. Z., November 9, 1911.

Mrs. ANNABELL M. HAMMOND,
South Orange, N. J.

Dear Mrs. Hammond:

Capt. A. W. Haynes of the Panama R. R. S. S. *Allianca* will hand you herewith a set of resolutions in memory of the late Capt. Edwin D. Hammond, by his many friends on the Isthmus of Panama and with the Panama Railroad and Steamship Company.

Also he will hand you a Treasury draft for one thousand, One Hundred and Fifty Dollars ($1,150.00). This amount was subscribed by the late Captains' friends to be used in a manner elected by you.

Very respectfully,
W. G. ROSS,
Secretary and Treasurer to the Committee.

Convention of Isthmian Sunday School Association.

The Isthmian Sunday School Association held a convention at Gorgona on Sunday afternoon, November 12, the occasion being the annual visit of the secretary for the International Sunday School Association, the Rev. Aquila Lucas. Fifteen Sunday schools in the Canal Zone were represented, 100 teachers, workers and officers being present. The meeting was presided over by the president of the association, the Rev. A. A. Nellis, Commission chaplain at Empire and Culebra. Addresses were made by Mr. Maurice H. Thatcher, who spoke on the Sunday school as a historic institution; Justice Thomas E. Brown, Jr., who spoke on some values of Bible knowledge taking ethical, literary, and historical stand points; and the Rev. Mr. Lucas, who brought messages from the International association, and outlined the plans of that organization for the year. These plans fall under seven heads as follows: (1) Increase of effective organization; (2) increase of membership; (3) addition to the mission schools already organized; (4) additional interest in teachers' training classes; (5) organization of classes of adults for Bible study; (6) visiting, in connection with the home department of the Sunday schools; (7) conversions.

After a period of inactivity a Sunday school was reorganized in Bas Obispo on November 12 by the Rev. J. C. Elliott, and a school was started at Paraiso on the same day.

Saint Luke's Chapel and Guild.

The annual meeting of the Woman's Guild of St. Luke's Hospital chapel, Ancon, was held at the Hotel Tivoli on Tuesday afternoon, November 7. For the first time since its organization, on December 2, 1907, the guild had been in recess, meetings having been suspended during the months of September and October. Events of the past year in which the guild had share or interest were, the decorating of the church for the services at Thanksgiving and Christmas, the children's service and Christmas tree on December 28, when about 40 children were remembered with gifts, the annual picnic for the Sunday school at Tobaguilla, an entertainment for the organ fund, and a reception to Bishop Knight on his annual visitation in January. Gifts to the church during the year are a credence shelf, a litany desk, altar linens, and silk fittings for use in the altar service. During Lent meetings were held each Tuesday morning at the Hotel Tivoli, at which a series of addresses on church history and ritual were given by the chaplain. The officers elected for the year are as follows: President, Miss J. M. Beattie; Vice-President, Mrs. Charles F. Mason; Secretary, Mrs. J. P. Fyffe; Treasurer, Mrs. H. C. Hanson. The next meeting will be held at the home of Mrs. W. C. Gorgas on Tuesday afternoon, November 21, at 3.30 o'clock.

Under the direction of the guild the Sunday school of St. Luke's church will be reopened on Sunday, November 19. Instead of being as formerly from 9 to 10 o'clock, the school will meet immediately after the morning service, at 11 o'clock.

The usual service will be held at St. Luke's church on Thanksgiving day at 9 o'clock. The service will be short. There will be an address and suitable music will be provided.

The Rt. Rev. Albion W. Knight, bishop of Cuba, will arrive on the Isthmus on December 30 for his annual visitation. He will remain about ten days.

Church and Lodge Hall at Cristobal.

Because of the encroachment of the work on Cristobal Point it has been found necessary to remove the offices of the District and Circuit Courts from the rooms in Building No. 1, and the building erected by the Commission for church and lodge purposes has been remodelled to accommodate the courts. The lower story will be used by the District court and the upper story by the Circuit court, with offices for the officials.

The Union church at Cristobal hopes to be able to erect a church building, but in the meantime, services will be held at the usual hour, every Sunday evening at 7.45, in the Commission clubhouse, and the Sunday school will remove into the room formerly occupied by the District court.

Meetings of the lodges and societies will be held in the former rooms of the Circuit court. Following are the names of the societies that are affected by this change: Isthmian Order of Engineers and Conductors; Independent Order of Odd Fellows, Cristobal No. 2 and No. 474; Daughters of Pocahontas, Osceola Council, auxiliary to the Independent Order of Red Men; Independent Association of Mechanics, Canal Zone No. 699; Independent Order of Paraman Kangaroos, Cristobal No. 8; Knights of Pythias, Panama No. 1.

PERSONAL.

Chief Justice H. A. Gudger, accompanied by his wife and daughter, arrived on the *Colon* from his annual vacation in the States on November 12.

Sir Sydney Olivier, Governor of Jamacia, accompanied by members of his official household, arrived on the Isthmus on November 13, for a visit of four days.

Major G. M. Hoffman sailed on the *Allianca* on November 11 to spend his annual leave in the States.

Visitors to the Canal.

The Hotel Tivoli has made reservations for the following parties of tourists. House Committee on Appropriations, November 17, 35 persons; American Bankers' Association, November 30-December 2, 350 persons; University of Cincinnatti students, Christmas holidays, from 40 to 200 persons; House Committee on Interstate and Foreign Commerce, December 18, 50 persons; American Institute of Electrical Engineers, January 21 to February 1, 120 persons; Gregory tourists from St. Louis, January 25 to February 1, 100 persons; Business Men's League of St. Louis, February 15 to 22, 100 persons; Steamship *New York*, luncheon, February 2, and March 6, indefinite number of persons.

Church Notes.

There will be a Thanksgiving service in Christ Church, Colon, on Thanksgiving Day at 9 a. m. On Sunday, November 19, the annual harvest festival services will be held in the church.

The Ladies Auxiliary of the Empire Christian League will hold a Thanksgiving entertainment in the chapel on Friday, November 24. The program will consist of songs and recitations by the children of the village. The proceeds will be devoted to mission work in the Canal Zone.

The "Fidelity" Bible study class for women has been organized in Empire, with Mrs. H. A. Smith as the president, and Mrs. Stephen Witt as chairman of the social committee. The meetings are held on the first Tuesday in each month in the chapel. At each meeting a program is provided; mothers' meetings are a feature, and a reception follows each meeting.

I. B. of S. S. and D. M.

Local No. 19, I. B. of S. S. and D. M., will hold its regular meeting on Sunday, November 19, at Empire lodge hall at 12.15 p. m. All members are requested to attend.

Loyal Order of Moose.

All members in good standing of the Loyal Order of Moose who are located on the Isthmus are requested to communicate with Wm. A. Fawks, care of Division Engineer, Corozal, Canal Zone.

The monthly outing of the Boy Scouts was held on November 3, the day being spent at Toro Point. A Commission launch was detailed to carry the boys over and return and transportation was given on the Panama railroad for the party, which consisted of 53 boys and six scout masters. The next outing will be held on Thanksgiving day.

EXECUTIVE ORDER.

Permits for Carrying Firearms.

By authority of the President of the United States, it is ordered:

That Act No. 14 enacted by the Isthmian Canal Commission, by authority of the President under date of September 3, 1904, entitled "An Act to Establish a Penal Code for the Canal Zone, Isthmus of Panama," as amended by the Executive Order issued under the authority of the President by the Secretary of War, December 1, 1909, be, and the same is hereby, amended so that Section 456 of said Penal Code as amended in said Executive Order, shall now read as follows:

"The license fees for permits issued by the Treasurer under the provisions of this Title shall be as follows: For every permit issued to carry a firearm abroad, five dollars ($5); for every permit authorizing an overseer or watchman engaged by a private employer, ten dollars ($10), for each watchman or overseer so authorized to carry a firearm; for each hunting permit, five dollars ($5); provided that no charge shall be made for hunting permits issued to enlisted men of the land or naval forces of the United States stationed on the Isthmus of Panama. The treasurer shall keep a record of all licenses issued by him, with the name and residence of the persons to whom they are issued, and the date and serial number thereof."

HENRY L. STIMSON,
Secretary of War.

War Department, Washington, D. C.
November 3, 1911.

OFFICIAL CIRCULARS.

Consignment of Freight for Individuals or Companies.

CULEBRA, C. Z., November 6, 1911.

HEADS OF DEPARTMENTS AND DIVISIONS:

It has been brought to my attention that certain repair parts ordered by the Darien Gold Mining Company and the California-Atlantic S. S. Company were recently forwarded from the Gorgona Shops consigned to the Pacific Division at Balboa on I. C. C. billing. This was done to expedite shipments and save time. Although the facts in this instance were duly reported to the Panama Railroad Company in order that bill might be rendered against the two consignees, the practice is disapproved. For the protection of the Panama Railroad Company it is directed that all freight intended for individuals or companies be accurately consigned.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Acting Superintendent of Construction, Atlantic Division.

GATUN, November 10, 1911.

Effective November 11, and during the absence on leave of the undersigned, Mr. C. R. Hughes, Superintendent, will be in charge of construction work of the Gatun Dam and Spillway.

He is hereby authorized to sign my name over his initials to property papers.

G. M. HOFFMAN,
Resident Engineer.

Approved:
CHESTER HARDING,
Acting Division Engineer.

Sale of Panama Cafe Building.

PANAMA RAILROAD COMPANY,
OFFICE OF GENERAL SUPERINTENDENT,
COLON, R. P., October 27, 1911.

Sealed proposals for the purchase of building located on lot north of Panama passenger station, and known as "Panama Railroad Cafe" building, will be received in this office until 3.00 p. m., November 20, and then opened.

Bids must be made for the building as it stands on the ground, the successful bidder to remove the building within thirty days' time after notified that bid has been accepted.

Proposals should be accompanied by certified check, Post Office money order, or cash, for 5 per cent of the amount of bid, which will be returned to unsuccessful bidders.

The successful bidder will be given a freight rate of $2.25 per ton in case it is desired to ship the material to any point along the line.

Envelopes containing bids should be endorsed: "Proposal for purchase of Panama Railroad Cafe Building." and addressed to

J. A. SMITH,
General Superintendent,
Panama Railroad Company.

Misdirected Letters.

ANCON, C. Z., November 15, 1911.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The following is the schedule for moving picture shows for the week of November 20 to 25: Monday, Gorgona; Tuesday, Gatun; Wednesday, Cristobal; Thursday, Culebra; Friday, Empire; Saturday, Corozal.

The standing of the teams in the Isthmian Basket Ball League on November 11, was as follows:

Team.	Won.	Lost.	P. C.
Cristobal	6	0	1.000
Gatun	4	1	.800
Gorgona	3	2	.600
Culebra	2	3	.400
Corozal	0	4	.000
Empire	0	5	.000

Standing of the Isthmian Ten Pin League is as follows:

Team.	Won.	Lost.	P. C.
Empire	44	16	.733
Gatun	34	26	.567
Cristobal	33	27	.550
Gorgona	26	34	.417
Marines	26	34	.417
Culebra	17	43	.283

CULEBRA.

A local bowling tournament was organized on Saturday with four teams entered, each composed of six men.

The following were high scores for the week: Ten pins—Driscoll, 201; Case, 217; Cushing, 222; Warner 202. Duckpins—Palmer, 112; Case, 108; Dundas, 106, Judge, 106, 104.

EMPIRE.

The basket-ball game played Saturday, November 11, between the "Has Beens" and the regular team resulted in the formers' winning by the score of 32 to 16. The line-up was as follows:

"Hasbeens".		First Team.
Eason	L. Forward	Alley
Warr	R. forward	Koperski
Bartholemew	Center	Bushy
King	L. guard	Adams
Conn	R. guard	Greening

The regular monthly business meeting of the Literary Society will be held Friday evening, November 17. A good program has been arranged for this meeting.

Fifty new library books have just been placed in the library. They include some of the late fiction.

GORGONA.

The Social Study Club met Wednesday evening, November 8, and discussed the subject of accidents in industrial enterprises. At the meeting of the Club on November 15, the topic, "Health a Christian Duty," will be taken up.

Gorgona lost to Cristobal, Saturday night at basket ball, with a score of 12 to 10. The line-up was as follows:

Cristobal.		Gorgona.
Sartor	Forward	Loudon
Schlager	Forward	Moyer
Willer	Center	Swanson
Luce	Guard and Forward	Earle
Sterner	Guard and Forward	Carpenter
Schwalenberg	Guard	Booz
Causeneau	Guard	Calvit

Next Saturday night the Gorgona team goes to Gatun.

GATUN.

Twenty-three men met on Sunday evening and discussed the subject, "Unsanitary Occupations," under the auspices of the Drop-in Discussion Club. Those who spoke were: Messrs. Hastings, Windes, J. W. Smith, Christianson, Hanson, Gilkey, and Fitzgerald. The subject for November 19, will be "Sanitary Legislation."

One hundred and twenty-five new books were received from the States on Saturday, November 11, and placed on the shelves. The books are mostly popular fiction and books for boys. The addition of these books brings the number up to the thousand mark. Any member of the club may draw books by depositing one dollar and a half.

Thirty-five men have signed up for the Spanish classes, which meet every Wednesday evening under the leadership of Senor Gomez.

The following equipment will be added to the clubhouse in the near future: New punching bag disc, private locker, one vaulting horse, one jumping board, one climbing rope, one vaulting parallel-bars and 18 plants of various kinds to be used for decorating purposes. It is purposed to purchase material for a wrestling mat cover if such can be found on the Isthmus.

A large chorus of mixed voices will be organized at the Y. M. C. A. in the course of the next few days. Mr. A. B. Dickson will act as leader.

CRISTOBAL.

The Checker Club effected a permanent organization on Thursday evening. The following officers were elected: President, H. B. Furlong; Vice-President, W. T. Harrison; Secretary, F. E. Herrington.

The Chess Club also completed its organization, electing the following officers: President, G. K. Weston; Vice-President, W. F. Morrison; Secretary, E. S. Randolph.

COMMISSARY DEPARTMENT.

For the Convenience of Bachelors.

Effective November 6, 1911, the Commissary store at Corozal will be patronized only by bachelors and laborers from 11 a. m. to 1 p. m., and from 5 to 7 p. m. Women and children who wish to make purchases should do so between 8 and 11 a. m. and 3 and 5 p. m. Bachelors and laborers will be admitted at all times when the store is open.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

There have been no material changes in the cold storage price list since its publication two weeks gao.

Red Cross Finances.

A statement of Red Cross finances for October follows:

RECEIPTS.		
October 1, On hand	$2,025.14	
October 1, Interest on cash in bank, July and August	9.59	
Total receipts		$2,034.73
DISBURSEMENTS.		
October 2, Relief of destitute family at Empire	$5.00	
October 13, Relief of wife of prisoner at Culebra	15.00	
October 23, To assist in deportation of family at Empire	100.00	
October 31, Relief of blind man at Cristobal, account of Colon fire.	25.00	
Total disbursements		$ 145.00
October 31, Balance on hand		$1,889.73

JOHN L. PHILLIPS, *Treasurer.*

Approved:
C. A. DEVOL, *Chairman.*

Family Quarters.

Applications for married quarters were on file on November 1, as follows:

DISTRICT.	List No 1.	List No. 2.
Ancon	4 (1)	46 (11)
Ancon Hospital	....	6 (2)
Balboa	....	29 (6)
Bas Obispo	1	28 (4)

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, NOVEMBER 22, 1911. No. 13.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Chairman's Report.

The report of the Chairman of the Isthmian Canal Commission for the month of October is published in full in other columns of this issue of THE CANAL RECORD. It gives a detailed account of the progress of the Canal work in all departments and divisions.

Upper Guide Wall at Gatun Locks.

In the construction of the cellular section of the upper guide wall at Gatun Locks, that is, of the southernmost 750 feet of the center wall which extends from the upper guard gates 1500 feet into Gatun Lake, the 45 feet next the solid portion of the wall have been completed. The wall is 60 feet wide and the top is 99 feet above mean sealevel. At the outer end of the wall, and advancing toward the locks, a section 200 feet long has been built up to an elevation of 61 feet. A stiff-legged derrick has been installed on its present top and will place the concrete for the remaining 38 feet of elevation. Between these portions, the work is in various stages of advancement. About 30 per cent of the piles on which the wall is to rest have been driven. No difficulty is anticipated in having the wall built up to at least 23 feet above sealevel for its entire length by April 1, 1912, as required by the scheduled raising of the surface of Gatun Lake.

Miraflores Locks.

Hydraulic excavation for the open channel and basin south of Miraflores Locks is advancing with more satisfaction than was the case during the excavation for the lower lock chambers, the soil to the south containing less of gravel. During the month of October 52,500 cubic yards were removed by this method, making the total to November 1, 872,867 cubic yards. In this section the pumps removing the silt will be placed on stationary foundations beside sumps, it having been decided to abandon the concrete barges on which they have rested heretofore, because heavy rocks interfere with their movements. Two of the barges have been sawed to pieces and removed and the third barge will likewise be destroyed when the machinery on it is transferred by means of a track now being built. Part of the silt pumped from this section will be used for completing the hydraulic core of Miraflores Dam, but the greater part will be piped to the east of the Canal channel and used for filling in swamps. A retaining fill of earth is being thrown along the east side of the proposed Canal channel, west of the embankment for the railroad track to the Balboa sand wharf, for several hundred yards and the basin thus formed will also be filled hydraulically, to the level of the adjoining land.

The laying of concrete for the east side wall of the lower locks was begun last week, berm crane "F" having placed foundation over an area about 40 feet long and of the full base width, 28 feet.

Ancon–Sosa Swamp Reclamation.

The fill of the tidal swamp between Ancon and Sosa Hills and to the south of the Panama railroad track to Balboa, is about 20 per cent completed. Three dump tracks are in use on it. One began just south of the Panama railroad and parallel to it and is swinging radially to the south as the dump advances. Another began just north of the track leading to the Naos Island breakwater and the other Balboa dumps, and fill is made from this toward the one first mentioned. The third lies south of the Naos Island track and the fill is made toward Ancon Hill. The material used is from Culebra Cut and approximately 600,000 cubic yards will be disposed of, raising about 66 acres an average of 6 feet, with a slope from the center to afford drainage. The elimination of the swamp will improve sanitary conditions and afford a site for buildings or railway yards.

Story of the Fossils.

Another shipment of fossils collected from the excavations on the Isthmus will presently be sent to Washington for classification by the Government experts there. The collection of tertiary fossils made on the Canal work up to the present time is said by Dr. T. W. Vaughan of the U.S. Geological Survey to be the best that has ever been made in tropical America, and the information given by them and by a study of the rocks in which they occur will mark a new epoch in the geology of Central America. In fact, Dr. Vaughan said during his recent visit to the Isthmus that the geological section now being studied here contains more data of vital import to the geology of the world than that of any other section so far studied.

The University of Princeton spent many thousands of dollars in explorations in South America that had to do with the history of animal life, both prehistoric and recent, but this work like similar work carried on by other scientific bodies, has heretofore lacked the confirming evidence of geology with regard to animal migrations between North and South America. On this account biologists and paleontologists are waiting with interest for a history of the disappearing and reappearing land connection between the two Americas.

The Carnegie Institution at Washington is contemplating a study of the geology of all the countries bordering upon the Caribbean Sea, with a view to correlating and broadening the little known geology of the region. The geological work now being done on the Isthmus will form one of the standard sections of comparison in this broader work.

Gatun Spillway Dam.

Wooden forms are being placed on the west part of the Spillway for the construction of the inner shell of the concrete tunnel for machinery operating devices. On the east wing of the Spillway all the forms of the corresponding phase of this construction have been erected and about 90 per cent of the concrete has been laid. The tunnel shell is of rectangular shape with arched roof, 10 feet wide, and is 8 feet high, interior measurement. Concrete is to be laid around this form to make a shell one foot thick, and the outer walls and superstructure will be built so as to leave a space from 12 to 36 inches surrounding the shell on sides and top. The air space is to intercept seepage through the walls and assure the machinery protection from moisture. Channels at the base of the shell, between it and the outer walls, will drain off the seepage.

Repair of Dredge Spud.

One of the two holding spuds of pipe-line suction dredge *No. 83*, which is supplying hydraulic fill to the west wing of the Gatun Dam from the borrow pit below that wing, was broken on November 18, by the force of a caving-in of the bank against which the dredge was working. The dredge was towed to the coal chute trestle at the southern end of the lagoon and an emergency spud was substituted for the broken one, the metal parts of which will be attached to new timbers, forming a new spud to be reserved for emergencies. The work of substitution required the use of a 75-ton crane and it was necessary to renew some of the timber of the trestle and otherwise bolster it before the crane could be sent out on it.

Postal Business.

During the month of October there were 18,085 money orders issued, amounting to $417,576.83. Of this amount, $305,827.83 was issued payable in the United States, $110,781.39 in the Canal Zone, $907.61 in Martinique, and $60.00 in Costa Rica. The fees amounted to $1,893.08, and the amount of orders paid and repaid was $91,942.85.

Postal sales during the month amounted to $6,501.00, and newspaper postage to $16.10.

CANAL WORK IN OCTOBER.

Monthly Report of the Chairman and Chief Engineer to the Secretary of War.

CULEBRA, C. Z., November 15, 1911.

The Honorable the Secretary of War,
Washington, D. C.

SIR: I have the honor to submit the following report of operations on the Isthmus for the month of October, 1911.

Department of Construction and Engineering.

The following table summarizes the principal items of construction work accomplished by the Atlantic, Central and Pacific Divisions during the month:

ITEM.	Unit.	Atlantic.	Central.	Pacific.	Total.
Work excavation, dry	Cubic yards	66,031	1,314,483	136,245	1,516,759
Work excavation, wet	Cubic yards	470,400	4,704	339,815	814,919
Total work excavation	Cubic yards	536,431	1,319,187	476,060	2,331,678
No Plant excavation	....	....	....	....	....
Material placed in dams	Cubic yards	432,625	....	47,830	480,455
Concrete placed in locks and dams	Cubic yards	56,794	....	86,510	143,304
Explosives used	Tons (Gross)	53.25	192.97	35.45	281.67
Rock drilled	Feet	49,962	376,069	96,316	522,347
Tracks removed	Miles	....	8.29	....	8.29
New tracks laid	Miles	3.37	16.26	3.66	23.29
Rock crushed	Cubic yards	43,638	....	69,582	113,220
Cement used	Barrels	63,817	236	89,584	153,637
New roads built	Miles	0.43	....	....	0.43
Water mains laid	Feet	1,797	1,675	4,654	8,126
Sewers laid	Feet	....	50	461	511
Open drains and ditches dug	Feet	45,041	43,530	9,750	98,321
Average daily force	....	7,374	8,390	5,301	21,065
Average rainfall	Inches	16.72	13.42	10.69	13.52

First Division, Office of the Chief Engineer.

MASONRY AND LOCK STRUCTURES.

The material under contract for work designed in this subdivision is being inspected by the force of the General Purchasing Officer in the United States, and the erection work on the Isthmus is being conducted by the Division Engineers, the inspection of which is cared for by this subdivision. Several experiments of flow of water through orifices were also conducted under supervision of this office.

LOCK GATES AND PROTECTIVE DEVICES.

Shop work in the United States—Up to the 20th of October, 35,684 tons of material had been accepted at the mills, and 20,274 tons of structural material were shipped from the shops, or about 40 per cent of the total contract. (This item in the last month's report should have been 16,431 tons, instead of 20,765 tons, as given).

Gatun—The upper guard gates (4 leaves 54 feet 8 inches high), the upper gates, and the middle gates, upper lock, (8 leaves 77 feet high) have been manufactured and practically all the material has been shipped. The safety gates and lower gates, upper lock (8 leaves 77 feet high) have been 98 per cent manufactured, and about 90 per cent has been shipped. The middle and lower gates, middle lock (8 leaves 77 feet 10 inches high) are about 12 per cent manufactured, and practically no material has been shipped.

Pedro Miguel—The upper guard gates (4 leaves 54 feet 8 inches high) have been manufactured, and practically all structural material has been shipped. The upper and middle gates (8 leaves 79 feet high) have been 98 per cent manufactured, and about 90 per cent of the material has been shipped. The safety and lower gates (8 leaves 79 feet high) have been 68 per cent manufactured, and about 45 per cent of the material has been shipped. In addition to this a considerable tonnage of castings and a few handrailings have been shipped.

Miraflores—Practically none of this material has been manufactured or shipped.

LOCK GATE ERECTION.

Gatun—Upper guard gates, 54 feet 8 inches high; leaves 37, 38, 39, and 40: These leaves were practically erected with bolts, and the interior riveting was done on October 1. The only additional work done during the month was the riveting of a total of 15 panels of sheathing in all 4 leaves, i. e., the equivalent of about one side of one leaf, making a total of 34 panels to date. There remain to be riveted on these 4 leaves, 70 panels of sheathing out of a total of 104.

Upper gates, 77 feet high; leaves 33, 34, 35 and 36: The erection bridges, which had been used at the upper guard gates, were moved into position at the upper gates October 4-7. Since then, girders and frames have been erected, but not all riveted, 3 panels high on leaves 33 and 34; 8 panels high on leaf 35, and 7 panels high on leaf 36. The girders and frames in 2 panels of leaf 35, and 2 panels on leaf 36, have been riveted up. The work of adjusting these girders has been rather tedious, owing to some extent to too great haste in erecting the several stories without proper adjustment.

Pedro Miguel—Upper guard gates, leaves 50, 51, 52 and 53: Leaf 50, the skeleton has been erected with bolts during the month from top of 7th panel to top of gate, and riveted from third panel to top of tenth, sheathing bolted on 4 panels on downstream side, but none riveted. Leaf 51—The skeleton erected with bolts from top of the first to top of the tenth panel, and riveted to top of third panel; no sheathing erected. Leaf 52—Skeleton erected with bolts from top of fifth to top of seventh panel, riveted from top of second to top of fourth panel; no sheathing bolted on. Leaf 53—Skeleton erected with bolts from top of seventh panel to top of leaf; riveted from top of fifth to top of eleventh panel; sheathing erected with bolts 10 panels on downstream side, none riveted.

The total work of the month consisted in erecting, with bolts, 13 panels of skeleton, and riveting 18 panels of the same. There remain 9 panels to bolt together and 24 to rivet, besides all the sheathing. The work on these leaves, 51 and 52, has been much delayed by non-receipt of material.

The total tonnage erected to date without regard to its being riveted or not is 2,800 tons, out of a total of about 58,000 tons, or 4.8 per cent, and the total number of field rivets 122,000 out of 6,500,000, or about 2 per cent of the total.

INSPECTION OF OPERATING MACHINERY AND ELECTRICAL EQUIPMENT.

The force of this subdivision, reporting directly to this office, has cared for the technical matters relating to inspection as follows:

(*1*) *For the Stoney gate and cylindrical valve machines, purchased under Circular 614*—Preliminary tests have been made of the first Stoney gate valve machine erected at the shops of the contractor. In general, the machine performed its functions satisfactorily, with the exception, when working under maximum load, of a few minor details which are easily remedied; satisfactory results were obtained under the smaller loads. Complete tests have been made of the second cylindrical valve machine at the works of the contractor with motors of different manufacture and under different loads, and, with minor modifications, such as were made upon the first machine, it performs all of its functions satisfactorily.

(*2*) *For the rack railway and other material purchased under Cicular 619*—For Classes 1, 2, 3, 4, 7 and 8, under this circular, which are now under contract, the state of completion of delivery varies from 6 to 33 per cent. On all portions of this circular under contract, satisfactory progress has been made during the month, with the exception of the rack castings, and the difficulty which the contractor has experienced with shrinkage cracks and washouts has been practically overcome.

(*3*) *For the gate operating machines, Class 1, and miter forcing machines Class 2, purchased under Circular 627*—Satisfactory progress has been made with the gate operating machines, but the contractor has experienced difficulty in obtaining a suitable main casting of the casing for the miter gate forcing machine.

(*4*) *For the gate and girder hoisting machinery for the emergency dams, purchased under Circular 616*—Tests are in progress upon the three types of worm gearing hoists to be tried out as a part of this contract at the works of one of the sub-contractors.

During the month considerable material consisting of steel ties, channels and washers and other track material for the locks has been received and inspected.

The force organized for the installation of machinery and electrical equipment on the Isthmus completed two sets of wooden forms for the installation of foundation bolts for two Stoney valve machines, and installed all foundation bolts for machines Nos. 260 and 261, and foundation bolts for cylindrical valve 559. Sixty yards of concrete were placed during the month.

EMERGENCY DAMS.

The inspection work in the United States has progressed satisfactorily during the month. Up to the 20th of the month a total of 241 drawings of the turning and wedging machinery had been approved. At the works of the contractors, about 600 tons of nickel steel, and about 512 tons of carbon steel castings and forgings have been fabricated to date. Satisfactory progress has also been made on the roller bearings, all the roller bearings for one dam having been completed during the month.

AIDS TO NAVIGATION.

During the month 104 acres of land have been cleared in the Gatun lake section for sites for beacons and reference buoys, at an average cost of $10.83 per acre; 60,450 linear feet of trochas were cut; and the necessary land for making surveys was cleared and profile taken.

Work on the construction of Range 9-11, Pacific Division, continued during the month. The caisson for the front tower was completed and work on this tower will be begun at once. The tower walls, lantern, and lantern roof of the rear tower are in place, and the newel post for the circular stairs was constructed to a height of 12 feet during the month. Construction of the foundation for the front tower of Range 13-14 in the same division was started during the month.

Atlantic Division.

GATUN LOCKS.

Excavation—During the month one shovel was engaged on borrow pit excavation for the locks backfill, 21,723 cubic yards of material being removed.

Backfill—Backfilling behind the side walls of the upper, middle and lower locks, and in the center wall of the upper lock, was continued. The quantity placed during October aggregated 114,740 cubic yards, increasing the total to 913,466 cubic yards. On October 31 the backfilling was 56.82 per cent completed.

Receiving and Issuing Material—The consumption of rock exceeded the receipts by 5,637 cubic yards, and the receipts of sand and cement exceeded the consumption.

Mixing and Placing Plants—Both plants, and all portable mixers, were kept in satisfactory operation during the month.

Power Plant and Pumps—The operation of the power plant and pumps was satisfactory.

Iron and Steel Work—During the month 335.8 tons of fixed steel and 133,437 feet of reinforcing rods were placed; 65.8 tons of reinforcing rails and 150 feet of electric return track were laid.

Concrete Work—There was a decrease of 3,662 cubic yards in the amount of concrete laid as compared with the figures for the preceding month. The daily average for the 26 working days was 2,063 cubic yards, as compared with a daily average during September of 2,292 cubic yards. The total amount of concrete placed during the month was 53,636 cubic yards, including 1,424 cubic yards of large stone. The bucket measurement exceeded the place measurement by 634½ cubic yards. Of the total concrete, 6,541 cubic yards were placed in the upper lock, 5,289 cubic yards in the middle lock, and 41,806 cubic yards in the lower lock. The concrete work for the entire lock system was 83.68 per cent completed at the end of October.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)..	11.48	8.50
Average number of hours per day worked, per strand of cableway laying concrete and large stone (actual working time)	5.49	....
Average number of mixers per day	5.00	2 00
Average hourly output per mixer (actual working time), cu. yds.	59 91	63.65
Average amount of concrete and large stone laid per hour, per strand of cableway (actual working time) cu. yds.	33.80	....
Large stone laid, cu. yds	1,424	....
Concrete laid, cableways, cu. yds.	39 478	....
Concrete laid, through chute into dump cars, cu. yds.	1,830	....
Concrete laid, derricks, cu. yds..	....	4,074
Concrete laid, dump cars, cu. yds	....	5,808
Concrete laid, portable mixers..	....	1,656.5
Total amount of concrete and large stone laid, cu. yds	42,732	11,538.5

GATUN DAM.

Construction during the month increased the total fill, as determined by cross sections of the material in place, by 432,625 cubic yards, making the total amount in place 16,200,725 cubic yards.

Hydraulic Fill—The dredges increased the hydraulic fill by 214,320 cubic yards. The total hydraulic fill in place October 31 was 8,472,486 cubic yards.

Dry Fill—The material received from the Central Division and from steamshovels Nos. 116 and 134, amounting to 218,305 cubic yards was placed on the north and south toes of the dam, east and west of the spillway, making the total dry fill in place 7,728,266 cubic yards.

GATUN SPILLWAY.

Excavation—In preparing foundations for the spillway dam, 112 cubic yards of rock were removed by hand. On October 31, the total spillway excavation amounted to 1,586,296 cubic yards.

Concrete—The work of placing concrete was continued. The amount placed during the month aggregated 3,158 cubic yards, which increased the total to 162,539 cubic yards. The concrete work for the spillway was 72.23 per cent completed.

HARBOR AND CHANNEL SECTION.

Excavation below sea level at Mindi—During the month two steamshovels removed 6,570 cubic yards of earth and 59,349 cubic yards of rock from the canal prism.

Dredging from the Ocean to Mindi—Six dredges removed 432,653 cubic yards of earth and 37,747 cubic yards of rock from the canal prism. On October 31st 40 feet of water could be carried from Zero to Zero plus 1,900 feet; 35 feet to Mile 3 plus 2,400 feet; 30 feet to Mile 3 plus 3,600 feet; 20 feet to Mile 5 plus 2,438.9 feet, at the junction with the French Canal.

PORTO BELLO.

PERFORMANCE OF ROCK CRUSHER PLANT.

Length of working day, hours	8.00
Average number of hours worked per day..	4 06
Average number of cubic yards per hour of working day	209.79
Average number of cubic yards per working hour	413 08
Maximum day's output (5 hours 30 minutes) cu. yds.	2,358.00
Average day's output (26 days) cu. yds....	1,678.38
Average hourly output (193 hours 50 minutes, cu. yds	225.13
Total output for the month, cu. yds	43,638.00

SAND, STONE, AND CEMENT SERVICE.

In connection with this service plant steamed 6,250 miles, handled 780 barges, and carried 2,565 passengers.

WEST BREAKWATER, COLON.

Twenty three thousand seven hundred and sixty-five cubic yards of material were excavated, of which amount 21,815 cubic yards were placed in the breakwater, 150 cubic yards were used for breakwater track, and 1,800 cubic yards for fortification track fill. The double track trestle was extended 335 linear feet. On October 31 the trestle extended 7,467 linear feet from shore. The total amount of rock dredged and dumped on the west breakwater to October 1, 1911, was 726,717 cubic yards. During the month 37,747 cubic yards of rock were dredged and dumped, increasing the total to 764,464 cubic yards. The amount of dry fill placed to November 1 was 506,655 cubic yards.

NOMBRE DE DIOS.

During the month 81 barges, containing 38,928 cubic yards of sand, were shipped to Gatun.

MUNICIPAL ENGINEERING.

The reservoirs, water mains, sewers, roads and oil pipe lines were maintained and extended as required to facilitate construction work.

Central Division.

During the month of October the total amount of material excavated in the Central Division was 1,322,588 cubic yards, of which 189,482 cubic yards were classified as earth and 1,133,106 cubic yards as rock. Of this quantity 1,309,752 cubic yards were removed by steamshovels, 620 cubic yards by bucket crane, and contractors removed 4,704 cubic yards by sluicing and 7.512 cubic yards by hand. Of the total, 1,319,187 cubic yards consisted of primary excavation for the canal prism, and 3,401 cubic yards was excavation for tracks outside of prism

The daily average number of steamshovels at work during the month was 41.46, and the total number of shovel days was 1,078, as compared with 42.00 at work during the month of September, with 1,050 shovel days.

For comparison with the work done by steamshovels during the corresponding month of the previous year, the following table has been prepared:

Period.	Excavated by shovels.	Classification of material.		Av. No. of shovels at work	W'k'g days.	Av. yards per shovel day.
		Rock.	Earth.			
1910:	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*			*C. Y.*
Oct.....	1,598,335	1,076,678	521,657	47.50	26	1,294.20
1911:						
Oct.. ..	1,309,752	1,124,974	184,778	41.46	26	1,215.00

Rainfall at Empire: 1910, 12.57 ins.: 1911, 14.97 ins.

The above table shows the average output per shovel to be 6.12 per cent greater in October, 1910, than in the corresponding month of the present year.

The total amount of material excavated from the prism in the Culebra Section of the Central Division in October, 1911, 1,310,373 cubic yards, was the highest record in that section for the month of October, except October, 1910, when 1,320,314 cubic yards were removed.

The total estimated amount of material to be removed in the Central Division, according to the revised estimate of July 1, 1911, was 101,801,296 cubic yards, and up to November 1, 1911, 82,843,278 cubic yards had been removed, leaving 18,958,018 cubic yards to be removed in order to complete all excavation in the Central Division. From these figures it will be seen that 81.38 per cent of all excavation in the Central Division had been completed up to the close of the month of October, and 18.62 per cent remained uncompleted.

Considering the two sections which compose the Central Division, the excavation completed and that to be completed at the close of October operations were as follows:

CULEBRA SECTION.	*Cu. Yds.*
Completed	70,942,244
To be completed	18,501,761
CHAGRES SECTION.	*Cu. Yds.*
Completed	11,901,034
To be completed	456,257

From the above figures it will be seen that the Culebra Section, locally known as the "Culebra Cut," was 79.32 per cent completed, with 20.68 per cent to be completed; the Chagres Section was 96.31 per cent completed, with 3.69 per cent to be completed.

During the month 8,379 cubic yards of material were hauled from the canal prism and dumped in the embankment for the roadbed of the relocated Panama Railroad. The total amount of spoil from the Central Division used for this purpose at the close of the month was 3,962,807 cubic yards. The Central Division also delivered at Gatun 201,828 cubic yards of rock and earth, and 11,519 cubic yards were delivered to the Atlantic Division at Matachin, for use in the construction of the dam, making the total for this purpose at the end of October, 4,669,618 cubic yards.

During the month 21,660 cubic yards of rock and earth were delivered to the Pacific Division for use as backfill for the Pedro Miguel locks.

The daily average number of laborers at work on the whole Division during the month was 7,602, and the daily average number of gold employes was 788.

Pacific Division.

DISTRICT NO 1—LOCKS AND DAMS.

Excavation—The total excavation during the month amounted to 136,245 cubic yards, of which 10,070 cubic yards were classified as earth, and 126,175 cubic yards as rock.

Filling and Embankment—During October, 3,400 cubic yards of dry filling were added to the prism of the west dam at Pedro Miguel, increasing the total amount of material in place at the close of the month to 308,381 cubic yards. The backfill at Pedro Miguel was increased by 53,800 cubic yards, the total in place at the end of the month amounting to 403,300 cubic yards.

At Miraflores, 37,250 cubic yards were added to the dry fill in the toes, and 7,180 cubic yards to the hydraulic fill in the core of the west dam, making the totals at the end of the month 1,014,847 cubic yards and 646,278 cubic yards respectively. The backfill was increased by 31,850 cubic yards, the total aggregating 235,388 cubic yards at the end of the month.

Pedro Miguel Locks—The general backfilling of the west wall was practically completed at the end of the month. Tracks were laid prepatory to cutting in a steamshovel to excavate the hill back of the east lock wall, the spoil from which will be cast over and used for backfill. The filling in of the middle wall with sand and screenings was continued. The amount of iron placed in the masonry aggregated 90,394 pounds.

CONCRETE WORK—The total amount of concrete and large stone laid at Pedro Miguel was 25,637 cubic yards, as compared with 15,379 cubic yards during September. The concrete was placed as follows: 2,363 cubic yards in the floors; 377 cubic yards in the northwest wing wall; 590 cubic yards in the north center guide wall; 8,050 cubic yards in the east wall; 5,607 cubic yards in the center wall; and 8,650 cubic yards in the west wall.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT PEDRO MIGUEL.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)	8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	2.73	4.88
Average number of mixers per day	....	6.00
	Cu. Yds.	Cu. Yds.
Average hourly output per mixer (actual working time)	....	27.00
Average amount of concrete and large stone laid per hour, per chamber crane (actual working time)	43.46	....
Large stone laid	....	12.00
Concrete laid	6,165.00	19,460.00
Total concrete laid	6,165.00	19,472.00

Permanent plant consisted of two chamber cranes, placing.

Auxiliary plant consisted of three 2-cubic yard and four ½-cubic yard mixers; the latter discharging directly into forms. Locomotive cranes and derricks, averaging 3.8 units a day, were used in placing.

Miraflores Locks—The final berm crane was erected, and began placing concrete during the latter part of the month. Dry excavation was continued in the lower lock, eight steam shovels being employed. The backfilling of the east and west walls, also filling on east and west toes of the west dam were continued. Work was continued on the construction of concrete caisson shells for foundation piers of the north center guide wall, and the sinking of the first three caissons was begun during the month. During the month the amount of iron placed aggregated 1,013,506 pounds.

CONCRETE WORK—The total amount of concrete and large stone laid at Miraflores was 60,873 cubic yards, as compared with 56,083 cubic yards during September. The concrete was placed as follows: 453 cubic yards in the north center wall; 9,279 cubic yards in the east wall; 34,608 cubic yards in the center wall; 13,551 cubic yards in the west wall; and 2,982 cubic yards in the floors.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT MIRAFLORES.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)	8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	6.36	6.44
Average number of mixers per day	6.65	5.85
	Cu. Yds.	Cu. Yds.
Average hourly output per mixer (actual working time)	37.01	34.35
Average amount of concrete and large stone laid per hour, per berm, or chamber crane (actual working time)	60.72	....
Large stone laid	....	....
Concrete laid	49,821.00	11,052.00
Total concrete laid	49,821.00	11,052 00

Permanent plant consisted of three berm and two chamber cranes.

Auxiliary plant consisted of two 2-cubic yard mixers, and ½-cubic yard mixers averaging 3.85 a day; also locomotive cranes, placing, averaging .73 per day.

DISTRICT NO. 2—DREDGING.

The following is a statement of the output of the five dredges which were in operation during the month, and the amount of material excavated hydraulically:

DREDGE.	Type.	WORK.		PLANT.		Total.	Remarks.
		Earth.	Rock.	Earth.	Rock.		
		Cu. Yds.	Cu. Yds.	Cu. Yds.	Cu. Yds.	Cu. Yds.	
Cardenas	Dipper	2,452	21,120	....	....	23,572	Place measurement

*Excavated from Canal prism, south of Miraflores lock site.

Chamé Sand Excavation—Approximately 45,534 cubic yards of sand were excavated at Punta Chamé and delivered at Baboa.

DISTRICT NO. 3—MUNICIPAL AND SANITARY ENGINEERING.

The reservoirs, water mains, sewers, roads and oil pipe lines were maintained and extended as required to facilitate construction work.

Work was resumed on the Panama street improvements.

DISTRICT NO. 4—ANCON QUARRY.

PERFORMANCE OF ROCK CRUSHER PLANT.

Length of working day (hours)	8.00
Average number of hours per day (actual working time)	7.10
Average number of cubic yards crushed per hour of working day	334.50
Average number of cubic yards crushed per working hour	376.90
Total output for the month, cubic yards	69,582.00

(Includes 5,136 cubic yards omitted in September.)

Relocation of Panama Railroad.

During the month 375,810 cubic yards of material were excavated, increasing the total excavation at the close of the month to 8,954,038 cubic yards, and 409,145 cubic yards of material were placed in embankment, increasing the total for this purpose to 14,811,317 cubic yards.

The average daily number of steamshovels at work was 10.38, and the total number of working days was 26.

For comparison with the work done by steamshovels during the preceding month, and the corresponding month of the previous year, the following table has been prepared:

Period.	Excavated by shovels.	Classification of material.		Av. No. of shovels at work.	W'k'g days.	Av. yards per shovel day.
		Rock.	Earth.			
1910:	Cu. Yds.	Cu. Yds.	Cu. Yds.			C. Y.
Oct.	238,349	116,608	121,741	6.00	26	1,528
1911:						
Sept.	343,770	186,155	157,615	9.44	25	1,457
Oct.	367,085	229,865	137,220	10.38	26	1,360

No temporary trestle was driven during the month. Work on bridges and culverts was continued. No permanent track was laid during the month, the amount of 70-pound and 90-pound track remaining at 134,600 and 42,043 linear feet respectively. The force averaged 2,406 men.

Quartermaster's Department.

LABOR.

No contract laborers were received during the month. A large number of Spaniards came over on their own account, over 400 arriving on one steamer of the French line. Of this number, over 175 were assigned to the work, some of the remainder returning to Europe.

QUARTERS.

Laborers' quarters at Miraflores were completely filled, and additional barracks were opened at Corozal to relieve the congestion.

The San Pablo district has been vacated, there remaining but one family in I. C. C. quarters.

Sixty-five buildings were advertised for sale in the Tabernilla-San Pablo-Bohio district, of which 47 were sold, the total amount realized being $3,052.75. Forty-three buildings remain unsold in the lake area.

The 10th Infantry arrived on October 5, and is occupying quarters at Camp E. S. Otis, in the Las Cascadas district.

BUILDINGS.

The bathroom addition to the Hotel Tivoli was completed, and work on the new wing is under way.

Work was commenced on the caretaker's house at Brazos Brook. This is to be a concrete house of the No. 17 type, and is intended as permanent quarters.

MATERIAL AND SUPPLIES.

The value of material received from the United States during the month was $852,825.91, as compared with $581,348.64 during September, 1911. Supplies during the month were delivered by 36 steamers, the total weight of cargo aggregating 32,425 tons, exclusive of 889,882 feet B. M. Douglas fir lumber, 1,206,721 feet B. M. yellow pine lumber, 55,494 feet B. M. white oak lumber, 3,004 pieces of piling, and 2,700 cross ties.

Subsistence Department.

The operation of the European laborers' messes, the colored laborers' kitchens and the line hotels showed a net profit of $3,707.58. The operation of the Hotel Tivoli showed a net profit of $1,722.41, and there was a net profit on restaurants, penitentiary, tugs and dredges of $103.28. The net profit on subsistence operations was $5,533.27.

Department of Civil Administration.

COURTS.

During the month 16 civil and 61 criminal cases were disposed of in the Circuit Courts, and 81 civil and 645 criminal cases in the District Courts.

DIVISION OF POSTS, CUSTOMS, AND REVENUES.

Money order sales for October amounted to $417,589.83, and the fees to $1,893.18. Receipts from stamp and card sales, and newspaper postage aggregated $6,517.10. The total collection of revenues made by the division was $14,418.94, and the collection on account of court fines costs and fees, $3,499.12.

Thirty-one vessels entered at and 28 vessels cleared from the port of Ancon: and 17 vessels entered at and 16 vessels cleared from the port of Cristobal.

DIVISION OF POLICE AND PRISONS.

The total number of persons arrested was 629, of whom 592 were men and 37 women. Twenty-five nations, or 47 separate states and dependencies, were represented. The total number of arrests for the month was an increase of 37 as compared with month of September. Sixteen convicts were committed to the penitentiary, and 13 were discharged, leaving 136 in confinement at the close of the month. The cost of guarding and subsisting the convicts was $2,738.45, and the value of their work on Canal Zone roads $2,042.30.

DIVISION OF FIRE PROTECTION.

Seven fires were reported in the Canal Zone during the month, as compared with 12 in September. The damage to Commission property was $2.00.

DIVISION OF PUBLIC WORKS.

In the city of Panama the average daily consumption of water was 1,369,911 gallons, and in Colon 957,830 gallons.

The usual inspection and maintenance work of this division was performed during the month.

DIVISION OF SCHOOLS.

The schools were reopened on October 2. A new white school was opened at Las Cascadas, with an enrollment of 33 pupils. The white school at Tabernilla was discontinued, on account of canal operations, and the children from that district were sent to the Gatun school. New colored schools were opened at Miraflores, Cucaracha, Mandingo and Marajal, and colored schools were abolished at Balboa, San Pablo, Tabernilla, Bohio, Playa de Flor and Las Cascadas. The total enrollment in the white schools during the month was 1,174, and the average daily attendance 972.7, or 83 per cent of the enrollment; and in the colored schools the total enrollment was 931, and average daily attendance 568, or 61 per cent. Forty-three white and 24 colored teachers were employed in the division on October 31.

Department of Sanitation.

The total number of deaths from all causes among employes was 46. These were divided as follows: From disease, 38, and from violence, 8, giving the annual average per thousand of 9.15 and 1.93, respectively.

The annual average death rate per thousand among employes for the month of October in previous years since American occupation was as follows:

1904	20.31
1905	32.85
1906	46.68
1907	25.97
1908	12.93
1909	9.95
1910	10.19

The annual average death rate per thousand in the cities of Panama, Colon and the Canal Zone, including both employes and non-employes, was 21.35.

The annual average death rate per thousand for the month of October among the same class of population for previous years was as follows:

1905	56.62
1906	46.40
1907	30.19
1908	27.91
1909	16.62
1910	23.61

Segregating the whites from the blacks, the annual average death rate per thousand from disease among employes was, for whites, 4.87; blacks, 10.56; giving a general average of 9.15. For the same month during 1909, the annual average death rate per thousand from disease was, whites, 3.16; blacks, 8.56, giving a general average of 7.35, and for the same month during 1910, whites, 4.51; blacks, 5.98, giving a general average of 5.58.

Among employes during the month deaths from the principal diseases were as follows: Chronic nephritis, 3; dysentery, clinical, 1; haemoglobinuric fever, 1; lobar pneumonia, 13; malaria, 1; tuberculosis, 6, leaving a balance of 13 deaths from all other diseases, and 8 deaths from external violence.

Deaths from pneumonia have occurred almost exclusively among colored laborers recently brought to the Zone from the West Indies, as was the case in 1906 when an epidemic of the disease prevailed.

No case of yellow fever, smallpox, or plague originated on the Isthmus during the month. There was one death from bubonic plague of septicæmic variety at Ancon Hospital on October 17. The victim, a former employe of the Commission, left Guayaquil on October 7, on the steamship *Chile*, arriving at the quarantine station in the Bay of Panama on October 11. He was sick on the voyage, and had fever during the time he was in quarantine and when discharged. His case was diagnosed as malaria, from which he had been suffering while in Ecuador, according to a certificate furnished by the Marine Hospital surgeon in Guayaquil. He was discharged from quarantine October 13; was admitted to Ancon Hospital the same day, and died on October 17. The case revealed no external lesions of the disease, and was diagnosed at autopsy from smears taken from the spleen and femoral glands.

Respectfully,

GEO. W. GOETHALS, *Chairman.*

LIGHTING THE CANAL.

Progress of Work and Plans for its Execution.

Work on the project for lighting the Canal and placing buoys and daymarks was begun in April, 1911, and it is advancing in accordance with the schedule made in June. Surveys and clearing the land of obstructing trees and foliage are almost completed, and the construction of range light towers is under way.

A report outlining the project was published in THE CANAL RECORD of April 19, 1911. The scheme of illumination contemplates the use of range lights to establish direction on the longer tangents, and of side lights spaced about one mile apart to mark each side of the channel. The range lights are omitted in Culebra Cut, where their use is hardly practicable, and on four of the shorter tangents on the remainder of the Canal. The project includes a light and fog signal on the west breakwater in Limon Bay, a light on the east breakwater, should it be built, and gas and nun buoys lighting and marking the channel to the Mount Hope dry dock. Acetylene gas will be used for the lighted buoys in all the sections of the Canal, and for the beacons in the Gatun Lake section. For the beacons in the Atlantic, Pacific, Miraflores, and Culebra Cut sections, electricity or acetylene gas is to be used. The work is under the First Division of the office of the Chief Engineer, Assistant Engineer W. F. Beyer being in immediate charge.

CLEARINGS.

Reference to the map showing the layout of lights and beacons, published in this issue, will reveal the nature of the clearings. At each tangent, it is necessary to have two ranges, of two lights each, to prolong the sailing line, in order that the pilot may hold his course up to the point of turning. The range lights are situated on land, and it is necessary to cut a trocha through the jungle until suitable locations for the lights are found. These trochas are the width of the canal at their beginning and taper down to about 400 feet in width at the end. Surveyors run the lines, and then the clearing gang is set at work. Three surveying parties of ten men each have been employed, and the clearing gang consisted of about 100 men up to August, and since then of about 50 men. The work accomplished up to November 1 is indicated in the following table:

MONTH	Acres cleared	Trocha cut	Profile taken	Line run
		Feet.	*Feet.*	*Feet.*
April	51.0	....	....	....
May	145.5	64,825	10,200	....
June	177.0	57,350	6,000	....
July	146.2	50,720	28,869	....
August	133.0	45,040	4,478	*73,000
September	80.5	42,200	17,226	17,300
October	104.0	60,450	....	....
Total	837.2	320,585	66,773	90,300

*Center Line.

There remain to be cleared about 200 acres, composed of small areas in various sections. One of the longest areas to be cleared is that at the Frijoles tangent on the range-line for northbound ships. It is about 14,000 feet, or nearly three miles long, 1,000 feet wide at its beginning and 400 at the end. To find an elevation for the lights on this tangent it was necessary to cut through dense jungle and forest. The shortest area cleared is about 1,800 feet, and the others vary between these two extremes, local conditions determining in each instance.

CONSTRUCTION OF TOWERS AND BEACONS.

The construction of range towers was begun in the Pacific entrance, and is being carried on in accordance with the following schedule:

To June 30, 1912—Construct foundations and towers for Ranges Nos. 1-2, 9-11, and 13-14 of the Pacific section; foundations and towers for Ranges Nos 5-6, and 7-8, Atlantic section; foundations, towers and boat landings for Ranges Nos. 1-2, 11-12, 21-22, and 29-31, and foundations for beacons Nos. 19, 20, 23, 26, 27, 28, 30, and 32 in Gatun Lake section. Establish a central plant at Balboa, at which place the smaller beacons, buoy sinkers, electric transmission poles and interior fittings for the towers will be constructed of reinforced concrete.

To June 30, 1913—Complete the installation of beacons in the Atlantic and Pacific sections; as soon as the water is sufficiently high in Gatun Lake to permit the hauling of materials to the sites in barges, construct range towers in that section; erect reference targets. These reference targets will be part of the system of permanent marks on shore by which the location of the gas buoys will be established.

The construction of the light on the west breakwater at the Atlantic entrance will be governed by the status of the work on the pierhead, and of that of Range No. 1-2, Gatun Lake section, which will be on the south guide wall of Gatun Locks, by the status of work on the upper locks. During the fiscal year ending June, 1913, it is purposed also to construct the buoy depot on Gatun Lake, install the electric transmission lines required for the ranges and beacons, manufacture spar buoys, and construct the light keepers' dwellings.

Foundations for the range towers are of various types, depending on local conditions, and are exemplified in the foundations for Ranges Nos. 9-11, and 13-14 in the Pacific Division. The rear tower of Range No. 9-11, the focal plane of which is 56 feet above mean tide, is founded upon the rocks at Farfan Point, which at low tide are dry and at high tide are partly inundated. Loose rock was placed upon huge boulders and outcropping bed rock, and carefully leveled off at a height of 17 feet above low tide Upon this rock a hollow foundation pier, 24 by 24 feet in plan and 5 feet high, was constructed of reinforced concrete, the walls being 12 inches thick, thus making the deck of the pier 22 feet above low tide. The tower is built upon the deck of this pier. The front tower is founded upon a reinforced concrete caisson which rests upon 25 bearing piles, driven through the mud flats to bed rock, about 25 feet below the surface The butts of the wooden piles are protected with an armor of concrete from the surface of the mud flats to within about two feet above low tide and are capped with a concrete slab platform 12 inches thick and 26 feet square, reinforced with old T-rails and round bars. The caisson is 24 feet by 24 feet in plan, and 15 feet high, the bottom being 12 inches thick and heavily reinforced. The walls and tie walls are also 12 inches thick, and reinforced. The deck is 6 inches thick. The lower eight feet of the caisson was constructed on the shipways at Balboa, and after the concrete had sufficiently hardened the caisson was launched, and at high tide towed out to the site. When in position it was securely moored by means of four hawsers leading to anchors previously placed. the valves at the bottom of the caisson walls were opened to allow the water to enter, and thus it was gradually sunk onto the concrete platform. Sufficient ballast rock was then placed in the caisson to keep it in position, and the remaining seven feet of concrete walls, and the deck were constructed. The bottom of the caisson is seven feet above low tide and the deck is 22 feet above. At low tide the entire caisson is exposed. The sand around the base is protected against scour by rip-rap.

The front light of range No. 13-14, the focal plane of which is 56 feet above mean tide, is founded upon an octagonal foundation pier 24 feet between parallel sides, and 6 feet high, resting upon 29 bearing piles driven into the alluvial soil to refusal. The piles are armored and capped in similar manner to those of the foundation just described. The bottom of the foundation pier is 16 feet above low tide and its deck is 22 feet above. The rear tower is founded upon firm ground at the southeasterly end of Naños Island, the foundation consisting of a concrete slab 20 inches thick heavily reinforced.

The towers are constructed by means of steel forms, which are designed to be used for the three types of towers used in the Atlantic and Pacific sections. They consist of sections four feet high, of such size as to be easily handled by two laborers. The forms for the octagonal base are first set up and filled with concrete, after which the bottom ring of the conical portion of the tower is set up and filled, and then a second ring is set up and filled. After the concrete in the lower ring has set, the forms are stripped and set up on top of the second ring, and filled. The second ring is taken off and set up on top of the preceding, and so on to the belt course below the watchroom. The forms for the watchroom and lantern are then set up and filled with concrete. All the work is carried on from a scaffold tower inside the tower. In this way the tower rises at the rate of four feet per day. Wooden forms are placed between the interior and exterior steel forms for the purpose of coring out openings for doors and windows, which openings are later trimmed with concrete architrave moldings. sills, and lintels. The circular stairway in the tower is con-

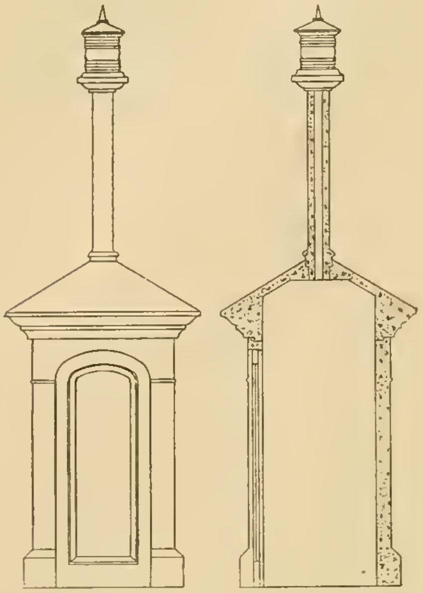
MAP SHOWING LIGHTING S M OF THE PANAMA CANAL.

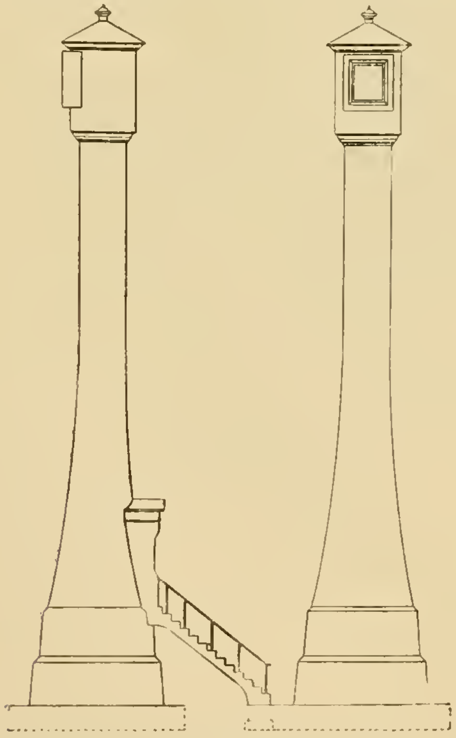
LARGE STAR INDICATES RANGE LIGHT. SMALL STAR AND BLACK LOZENG DICATE LIGHTED BUOY. LOZENGE MARK ALONE INDICATES UNLIGHTED BUOY.

structed entirely of reinforced concrete, the newel post being cast in place as the tower walls rise, and the stair treads and spiral stair string being cast in units at the central plant at Balboa. After the parts last named are sufficiently hardened they are taken to their respective towers and set in place, the stair string being supported by concrete beams placed radially between the newel post and tower walls and supported by them.



REINFORCED CONCRETE BEACONS FOR CULEBRA CUT, GATUN LAKE AND ATLANTIC AND PACIFIC SECTIONS.

The beacon shown is 15 feet high from base to focal plane, 5 feet 6 inches square at cornice of roof, 4 feet square below roof. Light post is of reinforced concrete, outside diameter 8 inches; inside 3 inches.



REINFORCED CONCRETE RANGE TOWERS FOR GATUN LAKE SECTION.

Heights vary from 30 to 50 feet from base to focal plane. This plain type of tower will be erected at points some distance from the channel.

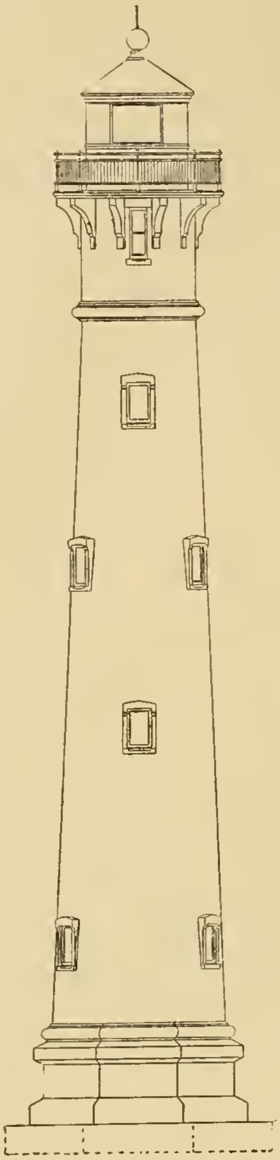
The only exposed metal on the towers consists of the gallery railing, lantern door and sash, and ventilators, all of which are made of rust-resisting iron, and bronze, and the cast iron ball ventilator at the apex of the tower.

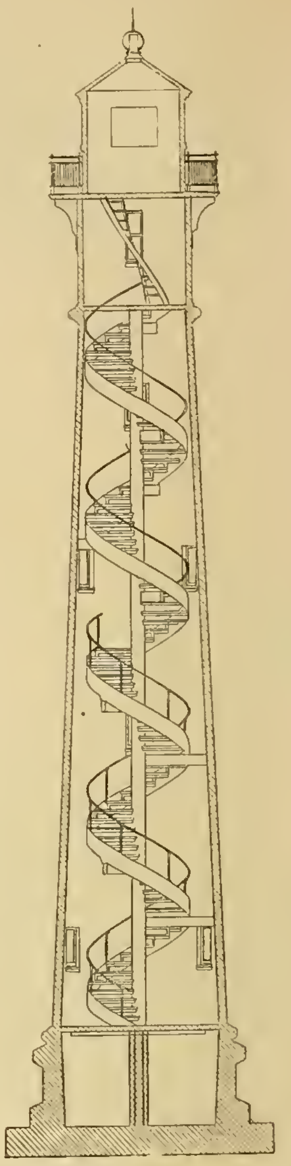
The lantern is supplied with slide ventilators by means of which circulation of the air may be regulated, thus insuring a steady flame in the lantern.

The material entering into the construction of the towers in the Pacific Division is loaded at Balboa upon a large lighter which is towed to the several sites. In the case of the two submarine sites for Range No. 9-11, the lighter was moored alongside the foundations and the work of construction carried on from the lighter.

The beacons for Culebra Cut, from Bas Obispo to Pedro Miguel, and along the sides of the channels in the Atlantic and Pacific Division and Gatun Lake section are 4 feet by 4 feet in plan, 7 feet high to cornice, and are to be constructed of reinforced concrete, surmounted by a concrete post or column which will support the lens. They will be cast in sections at the central plant and later taken to their respective sites and set up. Those in Gatun Lake will be equipped for acetylene gas and the balance for electricity. The range towers for the Gatun Lake section are to be constructed in a similar manner to the towers in the Atlantic and Pacific divisions.

The material estimated as necessary for the towers and beacons is 105,900 pounds of reinforcing iron, 2,983 barrels of cement, 1,025 cubic yards of sand, 1,865 cubic yards of crushed rock, 45,000 board feet of lumber. The mixture for reinforced concrete is one part cement, 2 sand, 4 rock; for mass concrete 1: 3: 6.





REINFORCED CONCRETE RANGE TOWER FOR ATLANTIC AND PACIFIC SECTIONS.

This ornate type will be used in places near the channel. The heights of these towers vary from 29 to 74⅓ feet from base to focal plane. The tower shown is 74 feet 4 inches from base to focal plane, 16½ feet in diameter at base, and 7½ feet at focal plane.

BUOYS AND LIGHT POWER.

It has not yet been determined what gas buoys will be installed, but bids will soon be asked for this part of the system of lighting. Such buoys as will be required are composed of a cylindrical floating body or tank, surmounted by a steel frame which supports the lens at a height of about 15 feet above water level. The body is about 8 feet in diameter, to the bottom of which is attached a counterweight of suitable size to maintain the lantern frame in an upright position at all times. The buoys will be moored in position along the edge of the dredged channel by a heavy chain and a concrete sinker, and will remain lighted from 6 to 12 months without being recharged.

The candle power of the lights will vary according to the length of the range; being from about 2,500 to 15,000 candle power. The most powerful lights will be those marking the sea channels at the Atlantic and Pacific entrances, they being visible from about 12.5 to 18 nautical miles. The beacons and gas buoy lights will be about 950 candle power.

To eliminate the possibility of conflicting the lights with one another and with lights ashore, all the range lights, beacons, and buoys will have individual characteristics formed by flashes and combinations of flashes of light and dark intervals.

Canal Zone Census.

Edward Koch, a chief of division in the Bureau of the Census, has been appointed to direct the census of the Canal Zone under the Department of Civil Administration. It is expected that the preliminary work will begin next month.

The California-Atlantic steamship *Navajo* will sail, on its next departure from Balboa, direct to Pearl Harbor, Hawaiian Islands, with a full cargo of about 2,500 tons of structural iron for use in Government work there. This will be the first cargo shipped from Balboa to that port during the American occupation of the Zone. From Pearl Harbor the *Navajo* will sail for San Francisco, by way of Honolulu.

POSTAL SAVINGS SYSTEM.

Rules that will be Followed in Receiving Deposits.

The Postal savings system in the Canal Zone, without the payment of interest on the deposits, established by authority of Executive Order of September 8, 1911, will be conducted after the manner in which the system is being conducted in the United States, with the exception of a few changes, made necessary by local conditions.

Deposits will be accepted only from individuals of the age of ten years or over, and no account will be opened in the name of any corporation, association, society, firm or partnership, or in the name of two or more persons jointly, nor will any account be opened in the name of one person in trust for or on behalf of another person or persons.

A depositor must be a patron of the Post Office at which he opens an account, and no person will be permitted to have two accounts at any one office, or one account at one office and a second account at another office.

When a person applies to open an account he will be required to furnish the Postmaster information as to whether he is a patron of the office, and he will also be required to fill out an application, on Form P. S. 300, on which will appear the signature and other information concerning the depositor. This form, which is in the shape of a heavy envelope, is retained by the Postmaster for his files. The reverse side of the envelope combines a simple ledger record of the depositor's deposits and withdrawals, and a receptacle in which the Postmaster files the duplicate of all certificates issued to the depositor.

A number will be given to each account when it is opened, beginning with No. 1 and continuing in order, and this number is entered on the envelope Form 300, and on all original and duplicate certificates issued in the name of the depositor to whom the account belongs. An account which has been closed and again opened, or a new account, will be given a new number.

Postal savings deposits will be evidenced by non-transferable and non-negotiable certificates, in fixed denominations of one, two, five, ten, twenty, fifty and one hundred dollars, each certificate bearing a serial number and containing spaces in which the issuing Postmaster will enter the name of the depository office, the date of issue, the number of the depositor's account, and the name of the depositor. Before delivery of the original, the depositor will be required to sign the duplicate certificate, which the Postmaster will retain and place in the depositor's envelope, Form P. S. 300.

A depositor, when opening an account, will be furnished a depositor's envelope, Form P. S. 301, in which he may preserve his certificates of deposit, and on which is printed, in addition to information for his guidance, a blank ledger record for keeping account of his deposits and withdrawals.

In the conduct of the system in the Canal Zone, no limit will be placed to the amount that any depositor may deposit in any one month, or to the total amount of his deposits.

A certificate of deposit, as stated above, is not transferable or negotiable and it is valid until paid.

In the issue of Postal savings certificates, the regulations adopted by the United States Postal Savings System provide that the Postmaster must issue the smallest practicable number of certificates on account of a single deposit, and this rule will be adopted in the Canal Zone as far as practicable.

An account by an intending depositor must be opened in person, but an exception will be made to this rule when it is shown to the Postmaster's satisfaction that a person, because of infirmity or for any other good reason, cannot appear personally to open his account. Where an account cannot be opened in person, the representative of the intending depositor will be advised by the Postmaster as to the necessary requirements in order to open such account.

A person who is already a depositor may make subsequent deposits through a representative or by mail, but in such cases the original certificates will not be forwarded to the depositor until he has first signed and returned the duplicate certificate or certificates, which the Postmaster will mail to him for his signature.

Lost or destroyed certificates will be replaced by duplicates, issued without cost, when the requirements for obtaining duplicates have been complied with. Postmasters will not be permitted to receive Postal savings certificates for safe keeping.

A depositor presenting a certificate for payment must endorse it in the presence of the Postmaster, and surrender it; if he signs by mark his signature must be witnessed by two disinterested witnesses. A depositor who withdraws only a part of the amount called for by any certificate will be paid such amount, and a new certificate for the remaining amount will be issued to him.

When it has been shown to the Postmaster's satisfaction that a depositor, because of infirmity or for other good reason, cannot appear in person to make withdrawal, he may authorize his representative to make such withdrawal by a written order, on a blank to be furnished for the purpose. When such a depositor desires to withdraw only a part of the amount called for by any certificate, he may authorize his representative to make such withdrawal by a written order similar to the one to be used in making full withdrawal.

In the case of the death of a depositor, payment of the amount of the account will be made to the legal representative of the deceased.

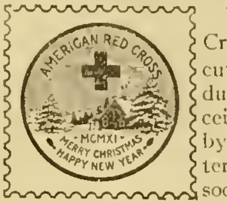
The amount of the reserve which Postmasters will keep on hand in connection with the issue and payment of Postal Savings certificates will be limited, and any person desiring to withdraw the amount of his certificates, when such certificates amount to several hundred dollars, should notify the Postmaster several days in advance, so that arrangements may be made by obtaining funds to meet the payment.

Where an employe of the Isthmian Canal Commission or Panama Railroad Company having an account at an office, is transferred to another station and desires to have his Postal savings account transferred to the office at which he is stationed, his account will be transferred upon his request.

Where an employe having a Postal Savings account returns to the States, it is proposed, should the depositor wish it, to issue him a check of the Treasurer of the Canal Zone on a Washington depository for the full amount of the depositor's account, or for any part of it, the remaining part to be paid in cash.

Deposits will be received at the following Post Offices: Ancon, Balboa, Bas Obispo, Corozal, Cristobal, Cristobal A (Porto Bello), Cristobal B (Toro Point), Culebra, Empire, Gatun, Gorgona, Las Cascadas, Matachin, Miraflores, Paraiso, Pedro Miguel.

Red Cross Seal.



Fifty thousand Red Cross seals, of which the cut herewith is a reproduction, have been received on the Isthmus by the Canal Zone Chapter. The National Association for the study and prevention of tuberculosis has authorized the Chairman of the Canal Zone Chapter sole agent for the sale of these stamps for the Canal Zone until March 1, 1912. The Christmas seals will be on sale at one cent each at the offices of the district quartermasters at all the stations in the Canal Zone, and at the Young Men's Christian Association clubhouses. The chairmen of local Red Cross Districts are requested to obtain their supply from these sources. In order to insure a large sale a woman's auxiliary will be organized by Mrs. C. A. Devol of Culebra and representatives will be appointed in each district for the purpose of interesting all the women in the Canal Zone in the enterprise. The National office in Washington hopes to sell 100,000,000. Over $300,000.00 was realized last year, from the sale of the Christmas seal.

Teachers and Clerks, Philippine Service.

Examinations have been announced by the Civil Service Commission, which it is expected to hold at Culebra on December 27 and 28, for assistant (male), teacher (male and female), and industrial teacher (male), in the Philippine Service. Applications must be forwarded to this office before December 5.

The entrance salaries for male and female appointees from the above examinations will probably be from $1,000 to $1,200 per annum.

A limited supply of the announcement of the above examinations has been received. Persons interested should request a copy of announcement No. 777, but an application blank should not be requested unless, after reading the announcement, intention is had to apply for one of the examinations. The announcement should be *immediately* returned to this office in order not to delay the dissemination of the information contained therein.

JOHN K. BAXTER,
Secretary, Isthmian Civil Service Board.

Missing Man.

Any one having information regarding the whereabouts of Robert Goodley, who left the service of the Isthmian Canal Commission in October, 1908, or of William B. McDonald, who is supposed to be on the Isthmus, is requested to communicate with the American Legation.

Obituary.

Joseph Turrell, an employe of the Pacific Division living at Ancon, committed suicide at his home on November 15. He was 37 years of age and had been on the Isthmus a little over five years; his home address was Helena, Montana. He is survived by his wife.

A passenger elevator will be installed in the Hotel Tivoli at Ancon. It is to be operated by electricity.

SOCIAL LIFE OF THE ZONE

Sunshine Society.

The organization of the Gatun Sunshine Society for the year 1911-1912 was effected on January 14, the membership at that time being 30. Mrs. H. A. Porter was the president. Since that time the society has forwarded $230 to the international headquarters in New York. The funds have been raised by members' dues, teas, sales held at various times, and an entertainment on October 31, the net proceeds of which were $100. The special interest of the organization has been devoted to the Arthur home for blind babies in Summit, N. J., where a dormitory for boys has been furnished and equipped, known as the Gatun dormitory.

The International Sunshine Society, of which the Gatun society is a branch, has for its purpose the caring for blind infants. Among its branches are institutions including a rest house in Brooklyn, a sanitarium, hospitals, and the Arthur home, which was opened last year. The work was organized in Gatun in 1908. This is the only branch on the Isthmus. It is also one of the largest organizations of women, having a membership of 50. Meetings of the society are held on the last Wednesday in each month. Dues are twenty-five cents a month.

Roman Catholic Bishopric and Missions.

The vacancy in the Roman Catholic bishopric of Panama caused by the death of Monseigneur Javier Junguito has been filled temporarily by the Vatican by the appointment of the Rev. Father William Rojas, formerly parish priest at Gorgona. The newly appointed apostolic administrator was born in Costa Rica and is a priest of the Order of St. Vincent de Paul. He came to the church of St. Cagetan, Gorgona, in 1908 from Colombia where for over twenty years he had been employed in the seminaries, the apostolic schools, and missions, and where he had also founded a mission of Indians. The Isthmian bishopric is the oldest on the continent of America; it was founded in Santa Maria la Antigua del Darien in 1513, removed with the Santa Maria colony to Old Panama in 1521, and finally after the destruction of Old Panama and the founding of the present city, was transferred to its present site in 1673.

The charge at Gorgona will be placed in the hands of the priests of St. Ferdinand's Church at Empire. Father Rojas intends to extend the parish of St. Ferdinand from Empire to San Pablo; the mission will then include many of the native villages in the interior. Three priests will be stationed at Empire for this work. In connection with this extension it is also purposed to open a parochial school in the parish house at Empire. Four sisters of the Order of St. Vincent will be brought from the States to take charge of the school. The parish house will be used for the sisters' house and a second house will be added to the church buildings for the accommodation of the priests. The parish school will be for white children.

Church Notes.

The meeting of the Ladies Auxiliary to the Empire Christian League on the last Friday in November will be omitted owing to the public meeting which will be held on the evening of that day. There will be an entertainment consisting of music and recitations. A thank offering will be asked to be used for mission work in the Canal Zone. The next meeting will take place in the chapel on Friday, December 1. The text books under discussion for the study of the coming year are "The Conservation of National Ideals," a work dealing with social and religious problems in the United States, and "The Light of the World," a study of comparative religions, by Robert E. Speers. In October nine new members were admitted to membership.

Under authority of the Southern Baptist Convention, the Baptist mission in the Canal Zone has leased a building lot in New Gatun for the purpose of erecting a church building. This will be a frame structure following the general type of the Canal Zone buildings, and will cost about $1,500. The mission will also construct a new church building in Colon to replace the one destroyed by fire in March. The site, on Bolivar Street, has already been granted, and the plans for the frame structure have been approved by the Commission. Work on the building will begin at once.

The Panama Mission of the Protestant Episcopal Church has sold the dwelling house erected for a rectory at Gatun about eighteen months ago to the Baptist Mission. The house, which is a modified type 17, will be used as a parsonage for the pastor in charge of the work at Gatun and Colon. This is the second house owned by the mission in the Canal Zone, the first having been constructed at Empire in 1909.

Services will be held in St. Mary's Episcopal Church, Empire, every Sunday evening at 7.45 o'clock. The Rev. Henry A. Brown will be the chaplain.

Revolver Championship.

In the revolver championship match held at Culebra on September 23, 24, 25, synchronously with the national matches in the United States the following scores were made, the figures in parentheses indicating the standings of the Canal Zone men in the national match, which have been certified by the United States Revolver Association:

Names.	Possible Scores.		
		A. 500	B. 500
L. D. Cornish	....	414 (34)	438 (19)
C. B. Larzelere	....	391 (51)	434 (31)
Jacob Bernson	....	386 (49)	430 (38)
M. W. Fox	....	394 (50)	426 (42)

Names.	Possible Scores.		
	C. 750	D. 250	F. 250
L. D. Cornish	541 (4)	198 (3)	167 (18)
C. B. Larzelere	504 (14)	169 (13)	161 (19)
Jacob Bernson	311 (22)	154 (19)	124 (28)
M. W. Fox	....	....	127 (27)
John Acors	353 (21)	....	....

Match A was for revolvers, 75 entrants, highest score 467; B, for pistols, 74 entrants, highest score 466; C and D for military revolvers, 5 shots in 15 seconds, entrants in C, 34, highest score, 665; entrants in D, 28, highest score, 208; F, pocket revolvers, 5 shots in 30 seconds, entrants, 30; highest score, 211.

In the National championship L. D. Cornish was awarded bronze medals for matches C and D. In the Canal Zone championship, gold, silver, and bronze medals were awarded to the first, second, and third contestants in each match.

Boy Scouts.

Each of the six companies of Boy Scouts in the Canal Zone has been granted a piece of land for the purpose of erecting a shack to be used as a clubhouse. The land is cleared and the shack built by the boys, under the direction of a scout master. The shacks are about ten by ten, roofed and roughly finished. The lumber for the purpose is given by the Commission. There is to be a reorganization of the scout commission, when the local commission will be merged in a central organization which, under the title of the Isthmian Scout Commission, will be granted a charter from the National headquarters in New York.

Uniform Rank, Knights of Pythias.

The first annual inspection and dance of Cristobal Company No. 1, Uniform Rank, Knights of Pythias, will be held at the clubhouse in Gatun on Wednesday evening, November 29. A special train leaving Paraiso between 7.00 and 7.30 on the night of November 29, returning at 12.30 a. m. on November 30, will be run for the accommodation of visitors. A general invitation is extended to members of the order and ladies.

University of Virginia Men.

Alumni and former students of the University of Virginia residing on the Isthmus are requested to send their names to Dr. W. McC. James, Ancon, who has been requested to forward them to the Registrar of the University and to the college newspaper.

At the annual bazar held by the Ladies Aid Society of the Methodist Episcopal Church on Friday, November 17, the receipts were $250.

OFFICIAL CIRCULARS.

Thanksgiving Day.

CULEBRA, C. Z., November 15, 1911.

CIRCULAR No. 419:

Thanksgiving Day, November 30, 1911, will be observed in the Canal Zone, and, as far as practicable, all public business will be suspended on that day.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Work Requests on P. R. R. for Individuals and Companies.

CULEBRA, C. Z., November 16, 1911.

CIRCULAR No. 417-A:

The General Superintendent of the Panama railroad is authorized to approve requests on Form C. E. 159 for the performance of work by the Panama Railroad Company for individuals and companies.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Second Class Passenger Rate on the P. R. R.

CULEBRA, C. Z., November 15, 1911.

CIRCULAR No. 420:

Effective December 1, 1911, the second-class passenger rate on the Panama Railroad will be reduced to two cents per mile, and the issuance of second-class half-rate requests and the sale of second-class half-rate tickets will be discontinued.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Pay Certificates.

EMPIRE, C. Z., Novembber 14, 1911.

ALL DEPARTMENTS:

The practice of requesting delivery of individual pay certificates in advance of delivery of the entire number covered by the roll in question, and in many cases before the pay roll has even reached this office, has grown to such an extent as to seriously interfere with the work of the office and to delay the working of the pay rolls.

In future all employes are requested not to ask for special delivery unless there is some very good reason therefor. Except in cases of an employe going on leave or terminating his service with the Commission no pay certificates will be delivered without written request from the Head of the Department to cover, stating the reason therefor.

Respectfully,
EDWARD J. WILLIAMS,
Disbursing Officer.

Approved:
GEO. W. GOETHALS,
Chairman and Chief Engineer.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is about 72 per cent completed, 162,260 cubic yards, out of a total of 225,000, having been placed at the close of work on November 18. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
November 13	49	3.00	1
November 14	28	2.00	1
November 15	100	5.30	1
November 16	124	6.00	1
November 17	168	7 00	1
November 18	124	6.00	1
Total	593	29.30	1
Previously reported	161,667		
Grand total	162,260		

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending November 18, follows:

DATE.	Hours worked.	Cubic Yards.
November 13	7.30	2,364
November 14	7.35	2,059
November 15	7.05	2,843
November 16	6.20	2,555
November 17	7.10	2,492
November 18	7.30	3,077
Total	43.10	15,390

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending November 18, follows:

DATE.	Hours worked.	Cubic Yards
November 13	5 00	2,094
November 14	4 15	1,852
November 15	3 45	1,772
November 16	4.30	2,119
November 17	3.50	1,702
November 18	3 48	1,484
Total	25.08	11,023

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending November 29, 1911. (75th meridian time):

DATE.	High.	Low.	High.	Low.	High.

Sale of Obsolete Metal Checks.

Office of Depot Quartermaster,
Mount Hope, C. Z., November 21, 1911.

Sealed bids will be received at the office of the Depot Quartermaster, Mount Hope, until two o'clock P. M., December 4, 1911, when they will be opened in the presence of attending bidders, for miscellaneous lot of, approximately, 47,000 old series metal checks. These may be seen on any working day between the hours of seven to eleven A. M., and one to five P. M., on application to this office. The right is reserved to reject any or all bids. Bids must be plainly marked "Proposal to purchase old metal checks, to be opened December 4 1911," and addressed to the Depot Quartermaster, Mount Hope, C. Z.

C. L. Parker,
Acting Depot Quartermaster

CONCRETE WORK IN THE LOCKS.

Over 71 per cent of the concrete for the locks is in place, the amount at the close of work on November 18, being 3,005,658 cubic yards, out of a total of approximately 4,199,400. A total of 26,169 cubic yards of concrete was laid in the locks during the week ending November 18.

GATUN LOCKS.

Over 84 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on November 18 being 1,706,219½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending November 18, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone.	Total.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The following is the schedule for moving picture shows for the week of November 27 to December 2: Monday, Empire; Tuesday, Cristobal; Wednesday, Gatun; Thursday, Gorgona; Friday, Corozal; Saturday, Culebra.

The standing of the teams in the Isthmian Basket Ball League on November 18, 1911:

Team.	Won.	Lost.	P. C.
Cristobal	6	0	1.000
Gatun	5	1	.833
Culebra	3	3	.500
Gorgona	3	3	.500
Empire	1	5	.167
Corozal	0	6	.000

Results of games November 11: Cristobal, 12, Gorgona, 10; November 13, Empire, 2, Corozal, 0 (forfeit); November 18, Gatun, 18, Gorgona, 15; Culebra, 21, Corozal, 15.

Games to be played November 25, 1911, Gatun at Cristobal, Corozal at Gorgona, Culebra at Empire

COROZAL.

Ten men have signed for the handicap pool tournament. Gold and silver medals will be given as prizes.

Arrangements have been made for an outdoor baseball game between teams representing the Cristobal and Corozal clubhouses. The game will be played at Corozal on Thanksgiving morning.

The Gorgona Minstrel Troupe will play at Corozal on Tuesday night, November 28.

CULEBRA.

A "stunt" class has been organized to meet on Monday evening from 8.00 to 10.00, to which all men are invited. The gymnastic work will consist of handball, wrestling, bar, Indian clubs, horse, and special work for individuals.

On Thanksgiving Day, Gatun will play Culebra at handball in the morning. Gorgona will play Culebra at volley ball in the afternoon, and an informal sociable will be held in the evening.

The high bowling scores for the week are as follows: Cushing, 224; Dougherty, 220; Hostetter, 215, 213.

EMPIRE.

The following high scores were bowled on the alleys during the past week: Ten pins—Snyder, 205; Pinney, 209, 213, 201, 223; Giavolli, 208; Parkis, 205. Duckpins—Rodeighiro, 101, 105; Pinney, 102, 111, 100, 105; Giavolli, 132.

The preliminaries in the billiard tournament have been played and the following is the standing: Class A, Messrs. Wood and Dryden; Class B, Messrs. Zinn and Potter; Class C, Messrs. Garrett and Decker. The finals will be played during the week of November 27

At the informal song service to be held on Sunday night November 26 there will be special music. All are invited to attend.

GORGONA.

Tickets for reserved seats for the first appearance of the Gorgona Minstrel Troupe at the clubhouse on November 27, will be on sale at the desk on November 22. New scenery, costumes and outfitting have been secured.

On Monday evening, November 13, the Gorgona Chess and Checker Club was organized, with W. I. Hodsden as president, and M. S. Fox, secretary. Messrs. Hershey, Hodsden and Hennen were appointed a committee on games and Messrs. Fox, Miller and Boster, on rules. Local and inter-association matches and tournaments will be arranged.

GATUN.

Spanish class No. 1 which meets at 7.30 o'clock Wednesday evenings is composed of Messrs. Moore, Fitter, Cosgrove, Mascomb, Mill, Harper, A., Harper, R., Connally, Duckworty, Perkins, Buschman, Turley, Johnson, S.sson, Lamot, Wilson, Huber, Mitchell, Atkins, Lore, Twitchell, Fitzpatrick, Parsons.

Spanish class No. 2 which meets at 8.30 includes Lueble, Sherburne, Worster, Langley, Dillon, Wilkie, McCollumn, Phillips, Lloyd, Madden, Jecko, Durgee, White.

The Gatun Y. M. C. A. Choral Club held its initial rehearsal on Monday evining November 20. Mr. Dickson of Culebra is in charge of the club.

Dr. J. J. McCormick will deliver a lecture on "Tuberculosis" on Thursday evening, November 23, at the clubhouse.

CRISTOBAL.

On Saturday night Gatun defeated the local team in two out of three games in duck pins with the following scores:

	Gatun.	Cristobal.
Total	457 440 448	432 477 430

During the week ending November 18, the following high scores were made on the local alleys: Duckpins—Louch, 103, 104, 102; Bullard, 106; Barrett, 106, 100, 102, 100, 104; Wheeler, 105, 103, 103, 116, 114, 102, 105; Smith, 101; Orr, E., 105, 102; Farrell, 101, 101; Marquez, 104; Cotton, E. 106; Teall, 105. Ten pins—Burns, T., 213, 217; Bullard, 201. Candle pins—Barte, 108.

Entries are now being received for the Thanksgiving Day Ten Pin Bowling Tournament in singles and doubles. Entries will close on the 28th.

A meeting of the representatives of various organizations was held on Tuesday evening, to make arrangements for a celebration of Christmas that will be of interest and pleasure to all the residents of Cristobal and the English speaking people of Colon. The following organization was effected: President, W. H. Kromer; secretary, E. C. McQuirk; treasurer, W. H. Marsh. The entertainment programme will be in charge of a committee from the Woman's Club, chairman, Mrs. Jas. Perkins. The committee on supplies is W. H. Kromer; decorations, Messrs Cousineau, DeLong, Putnam and Burrell, representing the Y. M. C. A.; A. V. Dayton, E. C. McQuirk, I. O. O. F., J. P. Mead; the Rev. C. H. Elliott, and Mrs. Morris representing the Church League.

The Topic Club on Christian Sociology will hold its next session on Monday, November 27, the subject, "Housing and Sanitation". Mr. Burrell will lead the discussion.

On November 29, the topic for debate at the Literary and Debating Club will be, "Resolved, that the awakening of the yellow race is inimical to the social, political and economic welfare of the white race."

On Thursday evening, W. F. Bernsee will give an exhibition of simultaneous checkers before the Checker Club. It is expected that at least 15 members will participate in this contest. The public is invited to attend.

On Friday, there will be a motion picture entertainment. This entertainment is an exchange of date with Empire.

COMMISSARY DEPARTMENT.

The commissaries are open during the following bours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

There have been no materjal changes in the cold storage price list since its publication three weeks ago.

Married.

CORNISH-VANDERGRIFT—At Cristobal on November 2, by Judge M. C. Rerdell, Duella Vandergrift of Covington, Ky., to Frank L. Cornish of Portsmouth, N. H. Canal Zone residence, Gatun.

JONES-MILLS—At Ancon on November 3, by Judge S. E. Blackburn, Mary G. Mills, daughter of Mr. and Mrs. W. A. Evans of Las Cascadas, to S. Jones of Nashville, N. C. Canal Zone residence, Ancon.

TRACY-BYNON—At Ancon on October 31, Florence Lydia Bynon of Lansford, Penn., to Norman Harding Tracy of Gatun, Canal Zone, the Rev. H. O. Purdy officiating. Canal Zone residence, Empire.

BEEMAN-LEONARD—On Wednesday, November 15 at the church of the Holy Redeemer, Culebra, by the Rev. Father Henry O. Collins, Verna M., daughter of Mr. and Mrs. Nicholas Leonard, to Mr. Donald H. Beeman. Canal Zone residence, Culebra.

Rainfall from November 1 to 18, 1911, Inclusive.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Joachim* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct, leave on Thursdays at 3 p. m.; ships for New Orleans in the coasting service on Thursdays at 4 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

The *Cristobal* will sail from Cristobal for New York at 2 p. m. on November 23. Among its passengers will be members of the House Committee on Appropriations.

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Empire, C. Z., on Sunday, November 26, 1911, at 6 p. m.

The next concert will be given at Cristobal, December 3, 1911, at 4.30 p. m.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, NOVEMBER 29, 1911. No. 14.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Sinking Caissons at Miraflores Locks.

Twenty-two of the 250 concrete caissons on which will rest the upper guide wall at Miraflores Locks have been set in place, and 11 have been sunk to rock, 41 feet below the surface. Drawing up the buckets of mud excavated from the bottoms of the caissons is done at present by means of 7 star-drill engines, working separately, and by a "nigger head" driven by a hoisting engine taken from a dismantled 70-ton Bucyrus steamshovel. This is a horizontal application of the principle of the capstan, the rope from the pit being drawn around a differential windlass by the friction caused by pulling on the free end of the rope. It was designed to use 8 such units, rope-driven in series by the same engine, but delay in arrival from the States of the necessary sprockets and sheaves has prevented putting more than one of the units in operation.

Each of the series of pulleys is to be attached at a working platform designed to afford the maximum of safety to men within the caisson. The structure forms a protecting cover over the pit, leaving a slight aperture for the passage of the rope by which the bucket is raised and lowered. The rope passes over a pulley above the platform, which is made with a movable section, or tray, on rollers. When the bucket comes to the top, the tray is drawn aside to allow the bucket to pass through the platform. As soon as it has done this, the tray is shot back into place, closing the aperture and resting directly under the bucket, which is slacked down to rest on this movable part of the platform. Then the tray, bearing the bucket, is rolled to the edge of the platform and the bucket is dumped into a Decauville car. To return the bucket to the pit is the reverse of the operation described.

The platform arrangement has been found to result in more rapid excavation than the use of hoisting apparatus without a pit cover, and the inability to put the entire series of platforms in use at Miraflores is regarded as a handicap. The best record for one day made by the outfit now in use there, working on 8 caissons of 7 feet 6 inches at outside diameter, has been an aggregate sinking of 26 feet. The daily average is about 21 feet.

Three Million Yards of Concrete.

Over 3,000,000 cubic yards of concrete have been laid in the construction of the three sets of locks for the Canal. This is approximately three-quarters of the concrete required for this work, which is estimated at 4,199,400 cubic yards. The exact percentage, as well as the percentages of completion at each set of locks, is given elsewhere in this issue, under the heading, "Concrete Work in the Locks". The figures do not include the spillways. That at Miraflores has not been begun. With its concrete dam, it will require about 70,000 cubic yards.

At Gatun Locks, the center and side walls of the upper and middle locks are practically finished. In the work on the lower chambers, practically 66 per cent of the total amount of concrete is in place. No concrete has been laid for the lower approach or wing walls. Of the upper guide wall, 795 feet nearest the locks have been completed, leaving the remaining 705 feet about 24 per cent completed. The upper wing walls are approximately 95 per cent completed.

For the single lift of Pedro Miguel Locks, the portions of the walls which form the actual chamber are practically completed. Of the lower approach wall, 950 feet have been completed, leaving 250 feet on which nothing has been done. The wing walls, except the southwest, are practically untouched, and building the upper approach wall has just begun. Excavation for its foundation is finished, with the exception of the "mucking," or cleaning off the soil adhering to the rock. The wall will extend 1,185 feet from the upper guard gates. The guard gates afford a hypothetical demarcation of center and approach walls, which are in reality a continuous monolith.

At Miraflores, the center and side walls of the upper locks are about completed. No concrete has been laid for the upper approach or wing walls, and the laying of concrete for the lower chambers has just begun, with the placing of some foundation in the east chamber.

Steamshovel Borrow Pit at Gatun.

Steamshovel 134 has joined shovel 116 in the borrow pit in the hills at the west end of Gatun Dam, and it is expected that two more shovels will be brought from Mindi for this work about the first of January. About 2,000,000 cubic yards of dry fill can be excavated from this site at an elevation of not less than 80 feet above sealevel, and carried by easy grades to the surface of the dam.

The steamshovels, as well as the three 300-class American, and two 30-ton French locomotives which draw the dirt trains from the pit, and the two star-drills at work in the excavation, are supplied with water from a 10,000-gallon tank erected near the west end of the dam at an elevation of 154 feet above sealevel. The tank is fed by an 8-inch main which takes water from a small stream at elevation of 160 and less than 60 feet from the tank. This arrangement supplies daily about 50,000 gallons of clear water, which is piped from the tank to the shovels and drills, and to two standpipes for the locomotives.

Progress in Erecting Gates.

A new gate-erection outfit for the McClintic-Marshall Company, consisting of a locomotive crane and a double-span railway truss bridge to carry the crane, and cars, over both chambers of the locks, has arrived at Pedro Miguel Locks and will be in use within two weeks in the erection of the safety gates. About 1,800 of the 5,000 tons of material required for these gates (Nos. 62 to 65) have arrived at the locks and, as fast as the west backfill is brought up to grade, the structural iron is spread over its surface in classified piles, convenient of designation and access. Additional tracks will be laid as required.

At the upper guard gates at Pedro Miguel the skeleton work for the four leaves has been brought to nearly full height, 54 feet. On two of the leaves the sheathing is all placed, but not riveted. With the completion of heavy lifting for these gates, the erection bridge will be moved to the site of the upper lock gates, thence to the intermediate gates, while the new construction outfit is at work on the six gates at the lower end of the chambers.

At Gatun the skeletons for the upper lock gates in the west chamber have been reared over half way, and falsework frames have been attached to hold them erect. At Gatun and Pedro Miguel, together, 12 out of the total of 92 leaves are under construction. It is expected that the number will be 16 within three weeks and 20 by the middle of January. No gate work has been done at Miraflores, with the exception of setting the hinge bases in the walls.

Plan for Moving Chamber Crane.

The chamber crane in the east chamber of the upper flight of Miraflores Locks will have completed its work on the upper center wall by about the end of December and it is purposed then to remove it to the lower lock chamber. A plan has been devised by which the transfer can be made without dismantling the crane, as was necessary to bring it to Miraflores Locks from Pedro Miguel, where it had been used before the Miraflores Locks were begun. The plan has been approved but its execution is contingent upon procuring timbers of requisite size already on the Zone, as too much time would be lost in ordering them from the States.

The crane is mounted on trucks running on tracks 60 feet from center to center. It is purposed to extend the tracks, which now

NOTES OF PROGRESS.

(Continued.)

rest on the floor of the upper chamber, over the pit of the lower chamber on heavy trestle work. Cribs, erected on the familiar principle of the log cabin, of 12 by 12 timbers, will be built up from the bottom of the pit. A set of jacks, resting on the top layer of timbers, will be placed under the corners of the trucks of the crane, the wheels will be removed and the jacks will be lowered till the trucks rest on a supplementary lot of jacks, set on the next lower stratum of timbers. The two top timbers will then be removed, affording access to the third stratum, on which the first set of jacks will be placed, and the process of stepping down will be continued.

The crane is to be lowered a distance of approximately 27½ feet, the difference in elevation between upper and lower chambers. It weighs 200 tons and its top is 110 feet above the rails on which rest its four trucks with 12 wheels each. Steel cables will be used to steady the structure during the moving. It is estimated that the work can be done within 10 to 15 days. To dismantle, transfer and rebuild would require not less than 6 weeks.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 72 per cent completed, 163,031 cubic yards, out of a total of 225,000, having been placed at the close of work on November 25. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
November 20	127	6.30	1
November 21	152	7.30	1
November 22	176	7.30	1
November 23	180	8.00	1
November 24	108	4.30	1
November 25	28	1.30	1
Total	771	35.30	1
Previously reported	162,260		
Grand total	163,031		

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending November 25, follows:

DATE.	Hours worked.	Cubic Yards.
November 20	4.20	1,798
November 21	4.15	1,758
November 22	4.10	1,947
November 23	4.38	2,044
November 24	4.05	1,801
November 25	3.25	1,076
Total	24.53	11,054

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending November 25, follows:

DATE.	Hours worked.	Cubic Yards.
November 20	7.20	2,514
November 21	7.05	3,072
November 22	6.40	2,715
November 23	6.05	2,612
November 24	6.00	2,008
November 25	6.50	2,557
Total	40.00	15,478

New Railway Station in Panama.

Plans are in preparation for a new passenger station in the city of Panama, to occupy the site of the present structure. The plans are not complete but the layout has so far been determined that work has been started on the new yard tracks, and two concrete alighting platforms are under construction. These platforms will be provided with umbrella covers, to afford protection from rain to those entering or leaving the trains, and for the present temporary protection will be provided from these sheds to the exit gates.

The permanent station building will occupy a position near the yards and a little east of the present building. It will provide more room and better layout for exits and cab stands. The work of tearing down the old station hotel building at the north end of the present station will be begun shortly.

CONCRETE WORK IN THE LOCKS.

Over 72 per cent of the concrete for the locks is in place, the amount at the close of work on November 25, being 3,031,082½ cubic yards, out of a total of approximately 4,199,400. A total of 25,424 cubic yards of concrete was laid in the locks during the week ending November 25.

GATUN LOCKS.

Over 85 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on November 25 being 1,717,778½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending November 25, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone.	Total.

GRAVING DOCK.

Plans for the Dry Dock at Pacific Entrance.

Plans for the completed Canal include a graving or dry dock in which repairs may be made to Government and other ships. The location of this dock has been fixed at Balboa. The design of the dock, and other facilities in which the Navy Department is particularly interested, has been placed under the immediate charge of Commissioner H. H. Rousseau, Civil Engineer, U. S. N., and he has made his recommendations covering the general characteristics of the dock. These recommendations have been referred to the Navy Department for an opinion as to whether the proposed cross section is satisfactory, and in order that it may submit a plan showing the number and arrangement of keel, bilge-keel, and bilge blocks with which it desires to have the dock equipped. The recommendations are as follows:

LOCATION.

To be at the Pacific terminus of the Canal in accordance with the preference which has been expressed by the Navy Department. The best site available is on the flat northwest of Balboa Hill where the excavation, as determined by borings, will be in hard rock. This has been more fully covered by the report of the Board of Terminals which will reach you within a day or two.

ARRANGEMENT.

The dry dock will point northeast and southwest. The repair shops will be placed alongside of it. The dock will be entered from an approach slip not less than 400 feet wide and 1,000 feet long.

DIMENSIONS.

The dimensions proposed are similar to the Canal locks, *i. e.*, a clear width at entrance of not less than 110 feet; a length sufficient to dock and repair vessels a thousand feet overall; and a depth over four-foot keel blocks of 35 feet as compared with mean sealevel. In order to obtain advantage of the full depth of the dock in emergency at very little increased cost a depth of 39 feet over the sill as compared with mean-sea-level is proposed. This will give a depth of 41.5 feet over the keel-blocks at mean high-water, and a depth of 46.2 feet over the keel-blocks at extreme high-water. The depth at mean low-water over the keel-blocks will be 29.3 feet.

ENTRANCE GATES.

The Canal locks are provided with steel miter gates, and, in addition, two floating steel caissons of the ordinary ship type will be provided with grooves at the head and foot of the locks to enable the lock chamber between the caisson groove and the upper or the lower miter gates to be unwatered. These conditions, together with the rather considerable range in tide, fix as the most satisfactory and economical method of closing the dry dock entrance, miter gates of design similar to the miter gates of the Canal locks. Outside of the dock miter gates there will be a sill for seating one of the Canal lock floating caissons when required either to examine and repair the dock gates or in case of emergency should the dock gates be inoperative. The dock gates will be operated electrically. The time of opening and closing will be about two minutes.

BODY OF DRY DOCK.

The floor of the dock will have a width of 100 feet, with side-altars that will permit the docking and convenient repair of the largest vessel that can be put through the entrance. Owing to the character of the material on which the dock will be founded, it is expected that the floor and sides will consist of a comparatively thin lining of dense concrete anchored to the underlying rock. It is considered especially desirable to limit the width of the dock at coping level to 140 feet. This is 21 feet greater than the width at coping level of England's latest graving docks, two of which are now under construction at the Admiralty Dockyard at Portsmouth, England, at a cost of about three million dollars each, and which I visited and inspected about two months ago. These graving docks have an entrance width of 110 feet and a length of about 831 feet. The additional 21 feet in width, which is proposed for the Balboa graving dock, is largely on account of the practice and assumed preference of the United States Navy in matters of this kind; and if the Navy Department is willing and feels able to approve a lesser number of side-altars or a slight reduction in width of the individual altars, it will enable the cost of the Balboa graving dock to be appreciably lessened. It is proposed that the body of the dock shall be furnished with the usual conveniences and accessories in the way of a sufficient number of slides and stairways giving access to the different altars, and that the floor drainage shall be adequately provided for, including two large longitudinal culverts running the full length of the dock under each side gutter, to assist in the rapid unwatering of the dock as the water level falls below the top of the blocks. The head of the dock will be curved, approaching a semicircle. It is proposed that the blocking system and fittings shall be similar to those which have been adopted as standard by the United States Navy. It is recommended that the dock be not fitted with intermediate gates, as such construction will add largely to the cost, and tend possibly to interfere with the repair of vessels approaching the maximum length of the dock, and because it is not believed that the convenience in carrying on the repair of ships and the saving in cost of pumping would at all justify or necessitate intermediate gates.

OTHER ACCESSORIES.

Along each side of the dock will be tracks for a 40-ton locomotive crane having reach to the center of the dock, and also standard gauge track for lighter cranes of as long reach as practicable. The dock will be provided with the usual capstans, electric-driven, at the head and at the entrance of the dock; also with bollards of standard size and spacing.

PUMPING PLANT.

The pumping plant will be located opposite the entrance of the dock and will consist of not less than three vertical, centrifugal pumps of large size, and two small drainage pumps. As it is expected electric current will be generated by the hydroelectric plant at Gatun, the cost of power will be extremely small. A culvert of large size will be built around the dock under the crane tracks to carry conduits for water, air, electricity, steam, etc., as required.

GENERAL.

The dock will conform in all respects to the requirements of Naval vessels, commercial vessels of all kinds, and vessels of the Panama Canal.

Sale of Obsolete Metal Checks.

OFFICE OF DEPOT QUARTERMASTER,
MOUNT HOPE, C. Z., November 21, 1911.

Sealed bids will be received at the office of the Depot Quartermaster, Mount Hope, until two o'clock P. M., December 4, 1911, when they will be opened in the presence of attending bidders, for miscellaneous lot of, approximately, 47,000 old series metal checks. These may be seen on any working day between the hours of seven to eleven A. M., and one to five P. M., on application to this office. The right is reserved to reject any or all bids. Bids must be plainly marked "Proposal to purchase old metal checks, to be opened December 4, 1911," and addressed to the Depot Quartermaster, Mount Hope, C. Z.

C. L. PARKER,
Acting Depot Quartermaster.

The following vessels arrived at, or departed from, the port of Balboa during the week ending November 25:

Arrivals—November 20, *Ucayali*, from Callao; November 21, *Chile*, from Guayaquil; November 22, *Huasco*, from Valparaiso; November 23, *Cuzco*, from San Francisco; November 24, *Pennsylvania*, from San Francisco; November 24, *Oberon*, from Port Harford.

Departures—November 19, *Peru*, to San Francisco; November 20, *Leelanaw*, to San Francisco; November 20, *Guatemala*, to Callao; November 23, *City of Panama*, to San Francisco.

LABOR FORCE AND QUARTERS IN OCTOBER.

The total force at work on the Canal and railroad on October 25, was 37,269, as compared with 37,315 at the end of September, 1911; with 35,334 in October, 1910, and 35,405 in October, 1909. Canal employes numbered 29,541 and railroad employes 7,728. The number of "gold" or white American employes in the Canal force, was 4,229, compared with 4,112 in September, 1911, and with 4,596 in October, 1910. The force report for October 25, follows:

DEPARTMENT.	SILVER EMPLOYES.*													Total Silver.	Total Gold.	Grand Total.

QUARTERS.

On November 1, there were 24,747 occupants of Commission quarters. Of these, 9,114 were white Americans, of whom 5,115 were men, 2,060 were women, and 1,939 were children. There were 5,972 Europeans of the laborer class, of whom 5,308 were men, 278 women, and 386 children. There were 9,661 West Indian negroes, of whom 7,352 were men, 1,033 women, and 1,276 children. Included in the above were 42 Asiatics, 138 East Indians and 108 Panamans.

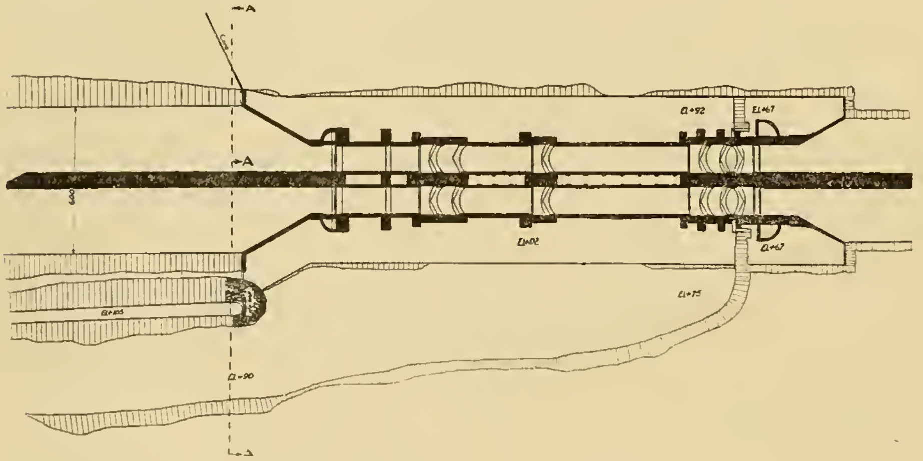
PEDRO MIGUEL DAM.

Formation of Barrier at Southern End of Gatun Lake.

The construction of the Pedro Miguel Dam, which is the southern, or Pacific, counterpart of Gatun Dam in impounding the waters of Gatun Lake, will be pushed with the beginning of the dry season. The dam will not be subjected to water pressure till after the flooding of Culebra Cut, which is protected by a dike at Bas Obispo, at its northern end. The dam is now about 50 per cent completed.

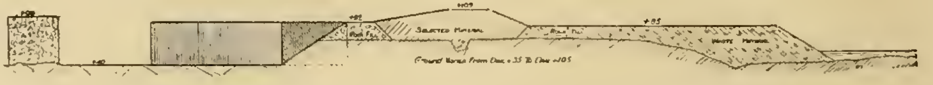
The site of Pedro Miguel Dam and Locks is at the southern end of Culebra Cut, where the Rio Grande, flowing from the continental divide to the Pacific, passes between a large hill on the west, which rises to the height of 525 feet, and one 250 feet high on the east. The width of the gap, across which the dam and locks are being constructed, is about 1,200 feet between the bases of the hills and about 2,000 feet at 92 feet above sealevel, which is the elevation of the upper lock walls. The average depth of excavation for the Canal prism through the gap is about 23 feet, that is, from the natural surface to 37 feet above sealevel, the elevation of the bottom of the upper lock chamber. The waters of the stream are carried off through the drainage culvert of the center wall, entering it at present through the intake just above the upper guard gate, on the east side.

The plan of the dam and of its connection with the locks is shown in the accompanying sketch (*A*). The dam connects the west hill, near Station 1917, with the upper west wing wall of the locks and is 1,400 feet long. It is to be 40 feet across the top, which is 105 feet above sealevel or 20 feet above the normal lake level. The side slopes are to be 8:1, so that the minimum width of base is about 800 feet. The dam will be subjected to a maximum head of water of 40 feet, though the average head will be 25 to 30 feet.



(*A*). PEDRO MIGUEL LOCKS AND EAST END OF DAM.

From the upper end of the west lock wall proper will extend a concrete wing wall, flaring at an angle of 30 degrees with the axis of the locks for a distance of 320 feet (till the Canal channel is 600 feet wide), and then running perpendicularly to the axis for about 80 feet. The top of the wall will be 92 feet above sealevel, or 55 feet above the bottom of the approach. The 320 feet of wall extending at 30 degrees with the axis is on a base 28 feet wide (elevation +37) including a toe on the front, on a batter of 1 in 3 to a point 15 feet above the base. At this point and for 4 feet above it the thickness of the wall is 23 feet, and the face is vertical to the top. On the back side, the wall at intervals of 6 feet, vertically, is stepped inward so that it is 10 feet wide on top. The portion of the wall which lies perpendicular to the axis of the Canal is to be built in two sections, a return wall, and a core wall. The first part will be vertical on the downstream, or south side. The top (elevation +92) will be 5 feet wide and the back will batter 3 on 1, the width of the base thus being determined by the variations in elevation of the rock on which it rests. The base of the core wall will be similarly determined by a batter of 6 on 1 from a width of 4 feet at elevation 92; but in this portion the face toward the north will be vertical and the batter will be on the lower side. The exact length of the sections perpendicular to the axis will be determined by the conditions developed by the excavation, but the return wall will be approximately 80 feet long, and the core wall approximately 70 feet. The west wing wall will contain 15,600 cubic yards of concrete, of which 670 yards had been placed on November 1.



(*B*). CROSS SECTION OF PEDRO MIGUEL DAM, FROM CENTER WALL OF LOCKS.

The east end of the dam is to be built up on both sides of this cut-off wall, which thus forms a concrete core for this end of the dam. The fill of dirt and rock will contain about 730,000 cubic yards, of which 370,000 cubic yards have been placed to date. About 30,600 cubic yards of rather porous soil are to be excavated at the junction of the dam with the hill at the west end, the space to be filled in with selected material, principally impervious clay. In the construction of the body of the dam, two ridges of rock are formed, between which is placed selected material to form a core 140 feet wide at the bottom. The material is puddled and rolled. The dam rests on practically impervious swamp soil of clay and sand, varying in depth from 10 to 30 feet above a stratum of argillaceous sandstone. The surface of the dam on the Gatun Lake side is to be riprapped with selected rock. The lower side will be inundated to the elevation of 55 feet above sealevel by the waters of Miraflores Lake, impounded by Miraflores Dam and Locks, about 2 miles south. A cross section of the dam, at its juncture with the locks, is shown in sketch (*B*).

On the east side of Pedro Miguel Locks, which lie close to the hill, a wing wall similar to the one on the west side, together with a similar core wall 260 feet long, will connect the locks directly with the hill. They will contain about 14,600 cubic yards of concrete, none of which has been laid. Resting on rock, and extending some distance into the hill, they will be almost perfectly watertight.

Lock Materials.

A requisition has been made, and advertisements will soon be published for bids, for miscellaneous material for the rock railways and miter gates of the locks, track bonds, flexible and solid conduit, junction boxes and conduit fittings, steel splice bars, brass pins, and sheet asbestos. Advertisement will also be made presently for 92 cover seats for the crank gear recesses in the lock walls.

Obsolete and Surplus Supplies.

The facilities for storing at Mount Hope obsolete and surplus equipment in charge of various departments have been augmented by the erection of a new storehouse, 50 by 150 feet in plan and 16 feet to the eaves. The roof and sides are of corrugated sheeting. A floor of secondhand steel plates is being laid. The amount of equipment turned in to the Depot Quartermaster has filled the storehouse originally designated for this purpose and additional space is required for storing and for exhibiting to intending purchasers. It is purposed later, when the total value would warrant it, to catalogue the goods, which represent nearly all phases of the Canal construction and of life on the Zone, and distribute these lists for information of intending bidders.

Pilots, Masters, Mates, Engineers, Chauffeurs.

Examinations for pilots, masters, mates, and engineers, and for chauffeurs, will be held by the Board of Local Inspectors at the Administration Building, Ancon, on December 6, 1911. All applicants for licenses as chauffeur must secure from the Department of Civil Administration, Executive Office, Ancon, forms of application, and information respecting the filling out of the same, not later than the day previous to the examination. All applicants for examination must be present at the Administration Building at 8.00 a. m. on December 6, with papers in proper form. In addition, applicants for chauffeurs' licenses must demonstrate their capacity properly to operate an automobile, and must have the automobile with them.

Canal Zone Rifle Club.

The annual individual member's match, for the National Rifle Association gold medal, will be held on the Gamboa range on December 3. Members participating will fire ten shots at 200, 300, and 500 yards, and will be allowed two sighting shots. The medal will be awarded to the person making the highest total.

CONCRETE ARCHES AT LOCKS.

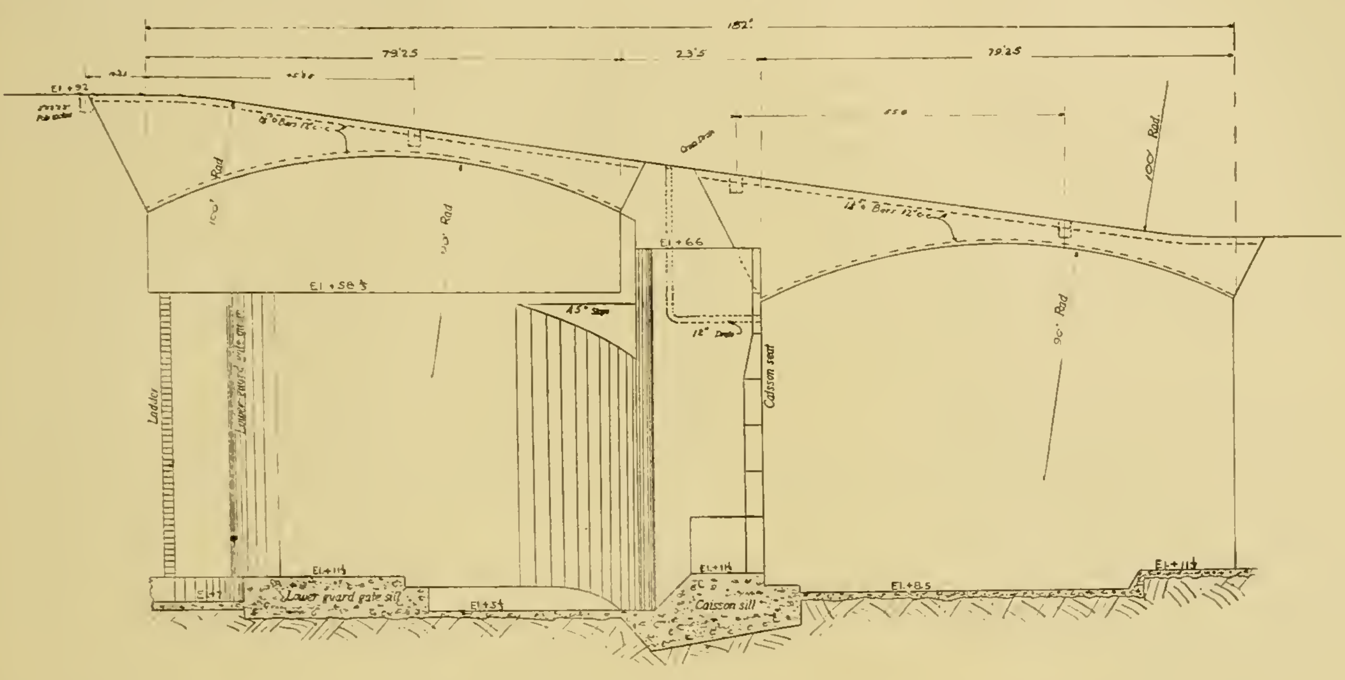
Graceful Structures Connecting Walls at Lower End.

No part of the lock construction at Pedro Miguel attracts more attention than the arches at the south end of the chambers, which connect the walls of the locks proper with the guide and flare walls of the approach. They are light and graceful in appearance and form an agreeable contrast to the plain massive walls of the lock chambers. At present this arch construction can be seen only at Pedro Miguel, but it will also be used in the lower approaches of the locks at Gatun and Miraflores, in the same relative location. In the accompanying sketch the nature of the work is indicated.

In each flight of locks the purpose of the arches is the same, namely to save concrete while making a bridge over which the electric towing mules will pass in towing a ship through the locks. Incidentally much is added to the beauty of the lock construction. There are two arches in each of the side walls and one in the center wall, making five for each flight of locks, fifteen in all.

At Pedro Miguel the side wall arches make a continuous bridge from the main lock walls at elevation 92 feet above sealevel to the wing walls at elevation 67 feet. The upper arch contains about 1,093 cubic yards of concrete and the lower, about 1,021 cubic yards; while the arch in the center wall contains about 1,850 cubic yards. Each side wall arch contains about 27,676 pounds of reinforcing steel, or 30 bars 1¼-inch square, 82 feet long, and 30 bars 1¼-inch square and 92 feet long, while the center wall arch contains about 47,100 pounds of iron.

The width of the arches in the side wall is 31½ feet, and center wall 54 feet; length of span of each arch, 79¼ feet; minimum thickness of crown, 5 feet; radius of intrados, 90 feet; rise of arch, 9 feet 2 inches.



SIDE WALL ARCHES, PEDRO MIGUEL LOCKS.

SOCIAL LIFE OF THE ZONE.

Woman's Guild of St. Luke's Church.

At the meeting of the Woman's Altar Guild of St. Luke's Church, Ancon, held at the home of Mrs. W. C. Gorgas on Tuesday afternoon, November 21, it was decided to hold the semimonthly meetings during the year, on the first Tuesday in each month at the Hotel Tivoli at 9.30 a. m.; on the second Tuesday at the home of a member at 3.30 p. m. As the guest of the guild for the afternoon, Mrs. C. A. Devol interested the members in the sale of the Red Cross Christmas seals. The receipts from the sale of these seals are devoted to the anti-tuberculosis work that is being carried on extensively in the United States. The guild purchased 1,000 seals and appointed Mrs. Charles W. Barber chairman of the sale for the organization. Those wishing to purchase them may be accommodated by applying to Mrs. Barber. The seals sell for one cent each. The postal authorities have given permission for the use of the seal on all packages and letters and post cards, provided that it is placed on the reverse side of the envelope or package, from that on which the government stamp is placed. The next meeting of the woman's guild will be held at the Hotel Tivoli on December 5, at 9.30 a. m.

Church Notes.

The Chapter of the Brotherhood of Saint Andrew, in connection with St. Stephen's Protestant Episcopal Church in New Gatun, has completed the required probationary period of three and one-half months and has been granted a charter. There are 40 members in the new chapter. St. Andrew's Day, November 30, will be observed by the Chapter with appropriate services in the church in the morning, followed by a banquet.

The Union Church and Sunday school at Las Cascadas held a "sociable" at the Commission chapel on Tuesday evening, November 14, for the benefit of the Christmas fund. There was a program, in which the children of the Sunday school took part, and ice cream and cakes were sold. The entertainment netted about $30.

Dr. B. D. Grey, Corresponding Secretary of the Home Mission Board of the Southern Baptist Convention, will arrive at Colon on November 30. He will hold services at Colon at 11 o'clock a. m. Sunday, December 3, and at Empire on the same day at 7.30 p. m. The public is invited to these meetings, especially those who are interested in Baptist work.

Thanksgiving Services.

The annual harvest festival thanksgiving service was held in Christ Church, Colon, on November 19. At the conclusion of the service a part of the fruits, breads and vegetables which had been placed within the chancel, were dispensed among the poor of the congregation; the remainder were sold, the amount received being placed as a thank offering in the church treasury. The Woman's Guild presented an offering of $100 as the result of the recent entertainment and other efforts. On Thanksgiving day there will be a service in the church at 9 a. m. There will be the usual short service in St. Luke's Church, Ancon, on Thanksgiving day at 9 a. m.

A Thanksgiving service was held in the Methodist Episcopal church, Panama, on Sunday, November 26. The Rev. Harry Compton was the preacher. On the same day Thanksgiving was celebrated in the Union Church, Cristobal, the Rev. Carl H. Elliott being the preacher.

Stages of the Chagres.

Maximum heights of the Chagres River for the week ending midnight, Saturday, November 25, 1911. All heights are in feet above mean sea level.

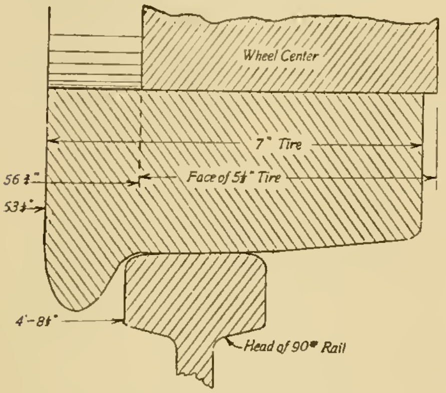
CONVERSION OF ROLLING STOCK.

Work Necessary for Changing from 5 Foot to Standard Gage.

An estimate has been made of the cost of converting the rolling stock now in use on the Canal construction from the present five foot gage of the Panama railroad to the standard 4 foot $8\frac{1}{2}$-inch gage of railways in the United States.

When the Panama railroad was built in the early fifties, railways were in their infancy and no standard gage was adopted until many years later. The Panama line held to its gage, and the French were obliged to adopt it for their rolling stock when they began to dig the canal, in order that their locomotives and cars could run over the main line of the railroad. When the Americans began work in 1904 they found all the old French track laid for the five foot gage and all the equipment available made for that width. Therefore the new rolling stock of all kinds was constructed to the five foot gage. This equipment, including locomotives, spoil cars of various types, locomotive cranes, spreaders, and other rolling stock, cannot be used in the United States, until the gage is changed, and with the view to selling it to advantage when the canal work is completed, the investigation with regard to change of gage has been made. The estimate for various kinds of equipment follows:



CHANGE OF TIRES TO CONVERT LOCOMOTIVE TO STANDARD GAGE.

CLASS 1.

Forty-ton flat cars, American Car & Foundry Company; 50-ton steel flat cars, Standard Steel Company; 40-ton box cars, American Car & Foundry Company; 60-ton box cars, American Car & Foundry Company; All steam shovels—The trucks of this class were so designed as to be readily convertible to standard gage. The wheel fits on the axles are turned for a length of 9 inches, and a collar 1-11/16 inches wide has been pressed on ahead of the wheel. The brake beams are punched for both gages. The work required will be as follows:

Remove wheels and collars from axles; press wheel to 4 foot $8\frac{1}{2}$-inch gage; press on collars; remove brake shoe heads; rivet on brake shoe heads; make brake hangers; assemble. Cost per car will be $27.20.

CLASS 2.

About 50 per cent of this equipment is without collars. These collars have been broken in service or by mounting new wheels on the axles. They comprise Class 2.

The operations will be:

Force wheels to gage; cast and finish $1\frac{3}{4}$-inch collars; mount collars; remove brake shoe heads; punch holes in brake beam; rivet brake shoe head on brake beam; make new brake shoe hangers; assemble. The cost per car will be $28.50.

CLASS 3.

Twelve-yard Western Steel Dumps; 25-yard Western Steel Dumps—This class of equipment has split axle collars instead of the solid ones. The collars are made up in two parts bolted together. The work required on this equipment is as follows:

Remove collars; press wheels to 4 foot $8\frac{1}{2}$-inch gage; replace collars; remove brake shoe heads; rivet on brake shoe heads; make new brake hangers; assemble. The cost per car will be $26.00.

CLASS 4.

All remaining equipment mounted on Master Car Builders trucks belongs to this class. The following work will be required:

Remove wheels; turn wheel fit on axle; mount wheels; cast and finish $1\frac{3}{4}$-inch collars; mount collars; remove brake shoe head; punch new holes; make new brake hangers; assemble. The cost per car will be $31.00.

CLASS 5.

Locomotives, 101 class; 201 class; 301 class; 601 class.—These classes of locomotives can be brought to standard gage by shrinking on 7-inch tires in place of the $5\frac{1}{2}$-inch as shown on accompanying sketch. The brake beam hangers and brake beams will have to be changed. On the 201 class locomotives the rivets in the mud ring will have to be countersunk in order to give clearance between the tire and the boiler. The cost will be: Class 101, 201 and 301, $775.00; Class 601, $850.00. No credit allowed on old tires.

PERSONAL.

Col. H. F. Hodges sailed for the States on his annual leave of absence on November 23.

Col. W. C. Gorgas, accompanied by his wife and daughter, sailed for Habana on November 28 to attend the convention of the American Medical Association.

Maj. J. P. Jervey, accompanied by his wife and daughter, and Capt. Courtland Nixon, with Mrs. Nixon, returned from their annual leave of absence on November 24.

Mr. A. L. Robinson, accompanied by Mrs. Robinson, is a passenger on the *Ancon* due to arrive at Cristobal on November 30.

Christmas at the Penitentiary.

In accordance with the practice of former years, the Christmas Committee for the relief of the convicts in the Canal Zone penitentiary will furnish a "treat" for the inmates on Christmas day. This treat consists of sweets, not including candies, fruits, nuts, and chewing tobacco. Contributions of any of these articles or of money will be received by the district quartermaster at any of the Canal Zone stations or they may be forwarded to the Rev. S. Moss Loveridge, penitentiary chaplain, or to Mrs. C. A. Devol, chairman of the committee. The funds remaining from the Christmas donations are apportioned by the committee to the relief of discharged convicts. The men are deported on being discharged and they are frequently entirely without means with the exception of the few dollars allowed to them by the government. The money is used to help them, often to purchase warm clothing, in case they are discharged in winter Cakes and all other articles intended for the Christmas dinner should be forwarded through the local district quartermasters on December 24.

EXECUTIVE ORDERS.

Authorizing the Employment of Alumni of the National School of Engineering of Mexico.

Such alumni of the National School of Engineering of Mexico as may be designated by the Mexican Government to observe certain public works in the United States and Panama may be employed under the several executive departments of the United States in connection with the works to which they may be assigned.

This order is issued in accordance with the principles of international comity to permit the action desired by the Mexican Government. As the matter is one relating to international courtesy rather than to the interests of the executive civil service, the Civil Service Commission makes no recommendation, regarding the wisdom of the proposed waiver as a matter pertaining to the Departments concerned.

WM. H. TAFT.

THE WHITE HOUSE.
November 6, 1911.

To Prevent the Unauthorized Purchase of Supplies and Equipment from Persons in the Army or Navy.

By virtue of the authority vested in me, I hereby establish the following order for the Canal Zone:

Section 1. Whoever shall knowingly purchase or receive in pledge for any obligation or indebtedness from any soldier, officer, sailor, or other person called into or employed in the military or naval service, any arms, equipment, ammunition, clothes, military stores, or other public property, whether furnished to the soldier, officer, sailor, or person under a clothing allowance or otherwise, such soldier, officer, sailor, or other person not having a lawful right to pledge or sell the same, shall be fined not more than Five Hundred Dollars, and imprisoned in jail not more than Two Years; and the Circuit Court of the Circuit wherein such supplies or equipment may have been unlawfully purchased or received in pledge shall have jurisdiction of the offense.

Section 2. This order shall take effect sixty days from and after its publication in THE CANAL RECORD.

WM. H. TAFT.

THE WHITE HOUSE.
November 15, 1911.

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Cristobal, C. Z., Sunday, December 3, 1911, at 4:30 P. M. The program follows:

1. March—*Inspector General*....................Losey
2. Selection—*Naughty Marietta*.............Herbert
3. *The Rosary* (By request)...............Nevin
4. Overture—*The Four Ages of Man*..........Lachner
5. (*a*) Two Step—*Alexander's Ragtime Band*...Berlin
   (*b*) Rag—*The Oceana Roll*...................Denni
6. Waltz—*Salute to Munich*..................Gung'l
7. Reverie—*Thoughts of Home*.....Chas. E. Jennings
8. Medley Selection—*Snyder's Popular Songs*. .Schulz
9. March—*The New Colonial*....................Hall

CHARLES E. JENNINGS, *Musical Director.*

The next concert will be given at Hotel Tivoli on December 10, at 7:30 p. m.

Sale at Public Auction.

There will be sold at Public Auction, by the District Quartermaster, at the old corral, Ancon, 2 p. m., Saturday, December 23, 1911, to the highest bidder, for cash, the following Isthmian Canal Commission property: Ten (10) mules, (American) and one (1) pony, (native). The Government reserves the right to accept or reject any or all bids. For further information, apply to District Quartermaster, Ancon, Canal Zone.
C. A. DEVOL, *Chief Quartermaster.*

ISTHMIAN HISTORIC FAKES.

The "Life for Every Tie" Story—Origin of Names of Settlements.

The recrudescence of the time-honored "fakes" about the high mortality during the construction of the Panama railroad and the origin of the name of Matachin and that of other Isthmian settlements, seems to make desirable the publication from THE CANAL RECORD of December 25, 1907, of a part of a letter from Gen. George W. Davis, first Governor of the Canal Zone:

It may seem almost heartless to shatter and destroy the beliefs of the oldest as well as the youngest Isthmian inhabitants respecting the history of the name of Matachin, which is known to all Panamanians as that of a station on the line of the Panama railroad.

We have all been told of the dreadful mortality that attended the making of this railroad—one dead man for every cross-tie on the whole line. We were expected to believe this yarn, and most of us did, but when one reflects that the road was 47½ miles long, the number of ties, 22 inches apart and allowing for sidings, the whole would mount up to quite 140,000. F. N. Otis, in his "Handbook of the Panama Railroad," published in 1861, states that from the beginning of construction in August, 1850, to the driving of the last spike in January, 1855, or less than four and one-half years, the largest number of laborers employed at any one time was 7,000 and this number was not reached until 1852, or after

There was no city or even a village at Colon at that time, and Otis says the population of Panama in 1861 was only 10,000. He also asserts that from the opening of the road for through traffic in 1855 to 1859, a period of four years, 196,000 passengers crossed the Isthmus by rail, "and it is not known that a single case of sickness has occurred during or in consequence of the transit."

In view of these facts we may well believe that the "yellow journals" of that period are the best authority that exists for the extravagant statements of mortality resulting from the construction operations—statements that were given world-wide publicity and are still accepted as fact.

It is well known that many laborers were imported and used on this first large Isthmian work. There were some Chinamen included, and we have been told that these Orientals were overwhelmed with melancholy and suicided by the hundred—harikari, drowning and by throwing themselves in front of passing locomotives; and in crowning, indubitable proof of this, it is asserted that the site of one of these Chinese camps where the wholesale suicide occurred was given a name appropriate to the action recorded by it, *i.e.*, "Dead Chinamen," or, in the language of the inhabitants, "Matachin," a railroad station near Gorgona.

I have made some investigations as to the pedigree or etymology of this name. In any good Spanish-English dictionary will be found the word "matachin," meaning "butcher," as "matadero" means a "slaughter house."

But this alone would not be proof to those who accept the other as the better definition. It is easy to prove that the name is a geographic one, for as applied to this locality it is hundreds of years older than road-making.

In 1678, or seven years after the exploit of Morgan in the capture and sacking of old Panama, there was published in Holland by Esquemeling, a book entitled "Buccaneers of America." This was translated into English and published by William Crooke of London in 1684. One chapter is devoted to a description of Morgan's raid, and one of the illustrative plates in this first edition of Esquemeling is a map of the Isthmus, including, on the Caribbean side, the coast of Porto Bello to beyond the mouth of the Chagres, while on the Pacific it covers the coast from old Panama to Penonomee amd Nata, and served to make plain the operations of Morgan in his previous capture of Porto Bello and the assault and capture of Fort San Lorenzo at the mouth of the Chagres, the trip up the Chagres and across the highlands to the goal of the expedition—the city established by Pedrarias in 1519. The artist attempts to show a distribution of the Buccaneers, their marches; and the scene is also depicted of the turning loose upon the "pirates" of the herd of wild bulls.

As a work of actual topographical delineation the map has little merit, for the distances and the relative positions of well-known physical features are in no true relation one to the other, yet the map is most interesting in many ways. The Chagres and all of its principal tributaries are shown; the Rio Grande, Caimeto, Capira and Nata are all marked and named, as are also the settlements Porto Bello, Chagres, Cruces, Chame, Penonomee, Cocle, and Nata. Along the Chagres from its mouth to Cruces probably fifty names appear of bends, landings, islands and ranches. Here we find Barbacoas, apparently the name of a hill. That monkeys were playful in those early days is evident, for Bailemonos is marked. The incident—hanging of an alligator—seems to have occurred during or before the seventeenth century, for Ahorca Lagarto* is shown, and strangest of all, spelled exactly as now, is Matachin, and at just about the place that answers to this railroad station.

This map, be it remembered, was made in 1678, or earlier, and was republished in England in the English edition in 1684, so that more than two hundred years before the Chinese tired of life on the Isthmus (if they ever did), the name which is cited as proof of their self-destruction was known to the Buccaneers and doing business. It may have been the stopping place where the butcher, whose occupation it designates, supplied the weary travelers with fresh meat.

Is there any more truth in the yarn this name has been made to embellish than in the assertions in the "yellow journals" of 1850-55? The map-maker does not omit to delineate Limon Bay, as we call it now, but a few years ago it was Navy Bay, a name which has probably been evolved from one which Columbus was said to have bestowed upon this body of water. On Esquemeling's maps it is marked P. Naos, meaning Puerto Naos, *i. e.*, "ship port," for *nao* is the Spanish for ship. Another spelling is *nave* and the plural *naves* It is not difficult to guess that "Navy Bay" has been evolved from Puerto Naos or Puerto Naves, for we know that in the fifteenth and sixteenth centuries all vessels were armed, fighting ships, and there were no other naval vessels than such as traded, explored and raided, or pirated over and beyond the oceans.

The inspection of this map was most interesting and it has seemed that the statement of the fact respecting the pedigree of the word Matachin will be interesting to many Canal employes who have visited this place made memorable by the notable events transpiring on the Isthmus hundreds of years ago.

---

*Otis says in his "Handbook": "The next station is called Ahorca Lagarto, "to hang the lizard," deriving its name from a landing-place on the Chagres near by; this, again, named from having, years back, been pitched upon as an encampment by a body of government troops, who suspended from a tree their banner, on which was a lizard, the insignia of the Order of Santiago."

OFFICIAL CIRCULARS.

Use of Liquid Fuel.

CULEBRA, C. Z., November 25, 1911.

CIRCULAR No. 421:

Effective December 1, 1911, the following rules are prescribed in respect to the sale by the Panama Railroad Commissary, and the use by occupants of Panama Railroad Company and Isthmian Canal Commission quarters, of grain alcohol, wood alcohol, denatured alcohol, gasoline and naphtha, for use as fuel:

Sales of any of these liquid fuels from the Commissaries (at the present time alcohol alone is offered for sale) shall not be made in excess of one quart to any person at one time, and the containers in which sold shall have pasted thereon a warning label reading as follows:

(Name of Liquid Fuel)
Poison.
DANGER!

NOTICE.

This container must be kept in a cool, well ventilated place, removed from lights or fire. Lamps or burners must never be filled while lighted. Only one quart will be sold to a purchaser at one time.

Employes of the Isthmian Canal Commission and Panama Railroad Company are forbidden to keep more than one quart of any one of the liquid fuels above listed in the quarters occupied by them, and will be expected to strictly observe the provisions of warning label above quoted.

The departments of the Isthmian Canal Commission and Panama Railroad Company having charge of their respective family quarters will have printed on heavy, durable paper or cardboard, and distributed to the occupants of such quarters, for posting conspicuously in kitchens or elsewhere, a warning notice reading as follows:

WARNING NOTICE.

Alcohol, gasoline, benzine, naphtha or kerosene are easily ignited. They must be kept in a cool, well ventilated place, removed from lights or fire. Lamps or burners must never be filled while lighted. The pouring of any of these fluids on a lighted fire or live coals, or on inflammable substances which it is the purpose to ignite, is dangerous to life, and is absolutely prohibited.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Loss of Locomotive Tools and Oiling Equipment.

CULEBRA, C. Z., November 27, 1911.

CIRCULAR No. 411-A. (Superseding Circular No. 411.)

My attention has been invited to the frequent loss of locomotive tools and oiling equipment, resulting, in most cases, from the failure of engineers to see that tools and oil boxes are properly locked before they leave their engines.

Boxes and chains with locks for securing tools, etc., being provided on each locomotive, the loss of such equipment from this cause is inexcusable, and any such loss will, in the future, subject the engineer responsible to discipline.

Locomotive engineers will be expected to see that their engines are provided with a sufficient number of locks and boxes to insure the proper safeguarding of this equipment, and in any case in which locks or boxes have been broken and the equipment removed, they will be expected to report the same promptly to the foreman of the engine house where engine is tied up when not working, who shall, in turn, report the facts to the yardmaster.

Hostlers will make a personal inspection of the firing tools and boxes containing locomotive tools and oil cans on each engine assigned to them as early as practicable after the arrival of the engine at the engine house, and will report to the foreman the number of each engine on which firing tools and boxes containing tools and oil cans are unlocked.

Before an engine is released from an engine house for service it will be inspected by a hostler, who will personally see that it is provided with an adequate supply of coal or oil, water and sand; that the fire is clean and in proper condition; that steam is raised to the required pressure; and that the authorized tools and oil cans are on the engine, and that all firing tools and boxes containing locomotive tools are locked.

When an engine is delivered to the Gorgona Shops for general repairs, the engineer will turn over the tools thereon to the shop officials and obtain a receipt for them. When the engine is sent out of the shop the tools received with it will be issued to the engineer and the latter will receipt for them.

In order to assist in the identification of locomotive tools, etc., all such equipment will be numbered by the Mechanical Division with the number of the locomotive to which the same belongs. This numbering will be performed at the different engine houses upon the delivery of the equipment there by the different divisions concerned. When engines are transferred from one division to another the tools will be transferred with the engine to which they belong.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The following is the schedule of moving picture entertainments for the week of December 4 to 9: Monday, Corozal; Tuesday, Empire; Wednesday, Culebra; Thursday, Gatun; Friday, Cristobal; Saturday, Gorgona.

The standing of the teams in the Isthmian Basket Ball League on November 25, 1911, follows:

Team.	Won.	Lost.	P. C.
Cristobal	7	0	1.000
Gatun	5	2	.714
Culebra	4	3	.571
Gorgona	4	3	.571
Empire	1	6	.143
Corozal	0	7	.000

Results of games played on November 25, follow: Cristobal, 22, Gatun, 9; Gorgona, 20, Corozal, 15; Culebra, 26, Empire, 15.

Games to be played on December 2, are as follows: Gorgona at Cristobal; Empire at Corozal; Culebra at Gatun.

CULEBRA.

Representative Kinkead addressed a large audience on Wednesday evening, November 22.

The "Stunt" gymnasium class meets every Monday night at 8 o'clock, preceded by a discussion of some hygienic subject. Every man in Culebra is invited.

The following are the high scores in bowling for the week: Ten pins—Case, 210; Dougherty, 213; Warner 204; Herrington, 207.

The MacWatters Male Quartet will give a concert at this clubhouse on December 4.

The following is the standing in the billiard tournament:

Name.	Won.	Lost.
Beyer	4	0
Case	3	0
Hertz	2	0
Conlon	2	1
Janney	2	1
McCann	2	1
Peters	2	1
Thomson	3	2
Dubois	0	3
Hepler	0	4
Tragsdorf	0	3
Vogel	0	4

EMPIRE.

The following high scores were bowled on the alleys during the past week: Ten pins—Rodeghiero, 214, 201, 201; Huson, 201; Pinney, 201; Duck pins—Pinney, 110, 102, 112, 106; Rodeghiero, 100, 108, 113, 102; Scull, 138.

Sunday night, December 3, the MacWatters Quartet will be at Empire. A sacred concert will be rendered at 8.00 p. m. A return engagement is made for December 12.

The Gorgona Minstrels will show here December 5. Reserved seats on sale on the Monday preceding.

The Empire chess players have been organized and a tournament will be started at once.

GATUN.

The membership receipts for this month have already gone over the four hundred dollar mark.

The second rehearsal of the Gatun Y. M. C. A. Choral Club was held at the I. C. C. Chapel on Monday evening, November 27. Several new members were added.

The gymnasium classes will meet on Tuesday and Friday evenings of this week at 8 o'clock.

The military band of the Tenth Infantry, consisting of thirty pieces, will give a concert at the clubhouse on the evening of Thanksgiving Day. Recitations and vocal solos will also be rendered.

The Secretary led the Discussion Club Sunday evening when the members discussed the subject of "Housing and Sanitation".

Wm. Hayne, Thos. Frayne and Lyons Mussina have added their names to the Spanish classes.

Thirty-five men attended the lecture given by Dr. J. J. McCormick on Thursday evening, November 23, on "The Prevention of Tuberculosis".

Cristobal defeated Gatun in a match game of duck pin bowling held at Gatun on Saturday evening, November 25.

Over forty members of the clubhouse accompanied the Gatun basket ball team to Cristobal on Saturday evening, November 28. The men marched in pairs from the Gatun clubhouse to the Gatun depot and on arriving at Colon the march was resumed to the Cristobal clubhouse where the Gatun rooters were assigned the north alcove of the gymnasium.

The first concert of the MacWatters Male Quartet will be held at Gatun on Tuesday evening, December 5.

The tentative date for the Gorgona Minstrels at Gatun is December 19.

The general appearance at night of the entrance of the clubhouse has been greatly improved by the addition of two 60 watt electric lights.

GORGONA.

On Friday evening, November 24, two days after being put on sale, all the seats for the first appearance of the Gorgona Minstrel Show were disposed of. Popular demand is for a return appearance.

A local ten pin tournament is in progress. The players have been divided into six teams. Results to date have been as follows:

November 21.				
Team No. 6.	Stoehr, Burmaster, Misal and Sundquist, Burns, Sims	652	736	667
Team No. 3.	Kenney, Charnley, Heim, Swanson, Sexton	757	763	769
November 23.				
Team No. 5.	Lowe, Shady, Strock, Robbertson, Bishop, Roper	712	749	780
Team No. 2.	Arnold, Clements, Stewart, Dunlop, Bordt	748	766	813
November 22.				
Team No. 1.	Wurdeman, Denst, Otis, Niles, Humphrey	722	733	710
Team No. 4.	Orr, Trieber, Moyer, Haldeman, Demmy, Haggerty	665	739	759
November 25.				
Team No. 4.	Trieber, Moyer, Demmy Haldeman, Haggerty	700	702	732
Team No. 5.	Lowe, Shady, Strock, Robertson, Bishop, Roper	725	792	716

This makes the standing of the teams on November 25, as follows: No. 2, 1000; No. 6, 1000; No. 4, 500; No. 5, 500; No. 1, 000; No. 3, 000.

In the basketball game with Corozal on Saturday night, the line-ups were as follows:

Corozal.		Gorgona.
Cooper	Forward	Loudon
Roberts	Forward	Stevens
Morris, W. H.	Center	Johnson
		Swanson
Stapleton	Guard	Carpenter
Morris, W. R.	Guard	Earle

CRISTOBAL.

Two hundred and forty-seven people attended the address delivered on three principles of success "Common Honesty, Hard Work and Hope" by Hon. Frank B. Willis, Representative from the Eighth District of Ohio, on Wednesday evening, November 22, under the auspices of the Literary and Debating Club.

Three hundred and fifty-seven people packed the auditorium Friday evening, November 24, to see the motion picture entertainment. The class and quality of pictures recently shown have been greatly improved.

On Thursday evening, November 23, an exhibition of simultaneous checkers was given in the social room by W. S. Burnsee, a Commission employe formerly of Brooklyn. Mr. Burnsee demonstrated his ability in this line by meeting 18 players in 27 games continuous play, and winning all games except one win and one draw, both of which were credited to Mr. William Payton. Membership in this club is free to any member of the Y. M. C. A.

The Literary and Debating Club will render a public program on Wednesday evening, November 6. A feature of the program will be a public debate on "Resolved, that we advocate the disarmament of nations." The affirmative will be sustained by Messrs. Elliott, Starla and O'Neal; the negative, by Messrs. Morrisson, Dinnin and Wempe. There will be a piano solo by Miss Layland.

The next in the series of stated subjects in Christian sociology is "The Tuberculosis Crusade." Discussion will be held on Monday evening from 7.30 to 8.15. All men interested in this topic will be welcomed. The discussion will be lead by William E. Burrell, Assistant Secretary.

On Thursday evening, December 7, the MacWatters Quartet of Boston University will give a varied program, entertainment beginning at 8.15 o'clock.

About 250 people attended the championship basket ball game Saturday night, November 25, between Gatun and Cristobal, played at Cristobal. Cristobal won, 22 to 9.

The following high scores were made on the local alleys during the week ending November 25: Duckpins—Marquez, 108, 103, 100; Wheeler, 117, 103, 103, 100 Smith, 100; Barrett, 103, 102, 102; Farrell, 108; Jacques, 109; Bullard, 109. Ten pins—Bullard, 202, 212, 213; Thomas, 234; Louch, 217, 209; Henry, 213.

LOST—One small brown female hound, sharp nose and short tail, on the Mandingo River. A reward of $10.00 is offered for her recovery by Henry Jackson, Las Cascadas.

There have been no material changes in the cold storage price list since its publication in the CANAL RECORD of November 1.

MOVEMENT OF OCEAN VESSELS.

The following is a list of the sailings of the Panama Railroad Steamship Company; of the Royal Mail Steam Packet Company; of the Hamburg-American Line, and of the United Fruit Company's Line.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Joachim* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct leave on Thursdays at 3 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, DECEMBER 6, 1911. No. 15.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Contract for Stoney Gates Valves.

Award for 114 Stoney gate valve machines has been authorized to the Wheeling Mold & Foundry Company. The original award under Circular 614 was for two of these machines, and the balance of the machines were to be purchased, provided the first two underwent satisfactory tests. These tests have been completed at the plant of the manufacturer, and the award has therefore been authorized.

Pyramidal Cap for Wall Forms.

In the construction of the cellular portion of the upper approach wall at Gatun Locks, it was found impracticable to dump the concrete directly from buckets into the 18-inch forms for the walls. The method adopted is to cap the inner forms for the rectangular cell with a pyramid of heavy boards. The concrete is dumped over the apex of the pyramid and flows down the sides in an approximately equal distribution among the forms at the base. Since all the concrete falls into the continuous space between two homologous rectangles, it can be packed evenly about the inner form without difficulty. At present the concrete is dumped from 2-cubic yard buckets by a stiff-legged derrick.

Excavation at San Pablo and Tabernilla.

Drilling preparatory to the excavation of the hill and railway embankment lying in the Canal channel at San Pablo, left there when the adjacent excavation was made because the hill was occupied by Commission quarters and the railway is a part of the main line of the Panama railroad, is about completed and steamshovel operations will begin shortly.

The Canal channel is 800 feet wide in this section but as the railroad crosses it on a curve the embankment to be removed is about 3,000 feet long. At its southern end a bench has been cut for the track on which the initial steamshovel will begin operations. The hill, just south of the station, rises to an elevation of 102 feet above sealevel and is principally of rock. The embankment is mostly of earth, and in the channel to the west of it are some slight knolls of earth. Of these, some of the material will have to be hauled to the dumps, while some may be thrown over into the corresponding depressions. This section of railroad will be abandoned about the middle of February, the trains running over the relocated Panama railroad, and the tracks will be torn up directly thereafter. It is expected to have the excavation completed by the end of April, 1912, when Gatun Lake will be dammed to raise its surface to 55 feet above sealevel.

Similar removal of railway embankment across the channel is to be made at Tabernilla at the same time. No extensive preparation has been made there, as the material is practically all earth and only about 15,000 cubic yards, as compared with some 258,000 cubic yards of mixed material at San Pablo.

Pacific Division Locks.

The berm cranes at Miraflores Locks have finished placing concrete on the northern part of the upper lock and are now at work at the lower end of the chambers. The tracks on which they moved are being torn up in their wakes and the backfilling for the upper lock is advancing to the south. The initial parts of the fills were made from the trestles by means of which the stock piles were supplied with sand and crushed rock, and after they were brought up to grade spur tracks were laid in order to extend the fill toward the locks. On each side the backfill will be at least 250 feet wide. The concrete for the completion of the north end of the side walls and for the wing walls, from which the berm cranes are now cut off, will be placed with derricks.

At Pedro Miguel, one of the chamber cranes is engaged in placing the filling of sand and rock screenings in the center wall. The other is placing concrete for the arches connecting the lock walls proper with the lower approach and wing walls.

An Inch of Rain a Minute.

All Isthmian records of excessive rainfall for short periods were broken at Porto Bello on the night of November 28-29 when approximately 2.46 inches of rain fell in three minutes between 2.07 and 2.10 a. m. The highest previous records of excessive rainfall were 0.75 of an inch in five minutes at Rio Grande in July, 1908, and 1.24 inches in ten minutes at Balboa in August, 1908. The total rainfall for the shower at Porto Bello was 7.60 inches.

Portable Pumps for Culebra Cut.

A portable pumping outfit, to be used for quick relief from flooding over relatively small areas of Culebra Cut, is under construction in the Central Division shops at Empire. On a flat car, formerly part of a steamshovel repair train, have been mounted two French centrifugal pumps, each capable of discharging 7,000 gallons of water per minute under a head of 20 feet, directly geared to a Westinghouse standard engine of 80 horsepower. The engine will be run by steam from the locomotive which draws the car. The 16-inch suction and discharge pipes on the pumps will have flexible joints to overcome the variations of surface of the flooded area.

The flooring of the car has been reenforced with a layer of 2-inch boards and the whole is covered with a corrugated metal roof, supported on stanchions at about 8 feet above the floor. About 12 feet of the length of the car have been made into a room for tools and repairs. The pumps and engine are grouped in the center of the remaining space. The outfit will be ready for service by the middle of the month.

Work of the Sandpiper.

During the month of November, the dredge *Sandpiper* working in the canal prism between Gatun and Mindi, excavated 257,563 cubic yards, place measurement, in 576 working hours. The number of actual engine hours was 476. The length of the pipe line was 3,000 feet, and the lift 20 feet. The largest weekly output during the month was 78,508 cubic yards—for the week ending November 25.

Dredge Brought from Nombre de Dios.

The eighteen-inch suction dredge No. 4, which had been engaged in sand excavation at Nombre de Dios, has, since the discontinuance on November 15 of supplying sand from that point, been brought to the dry dock for repairs, and will, when the repairs are completed, be placed at work in the sea level portion of the canal between Gatun and Mindi.

Laying Superstructure of Lumber Wharf.

The laying of concrete for the superstructure of the lumber wharf at Balboa was begun on December 1 and the first panel at the west end, is now completed. Each panel is to be the full width of the wharf, 55 feet, and extend 30 feet along the axis. The 50 concrete caissons on which the wharf is to rest have been set in a double row, at intervals of 30 feet; a panel is so constructed that its transverse central axis lies directly across the two caissons and the junctures are midway between the sets. Thus there will be 23 panels and at each end of the wharf a section, or half-panel, 15 feet long. All but 3 of the caissons have been sunk to full depth. These will be completed this week, after which another concrete laying outfit will begin operations at the east end of the wharf and the two will work toward one another. Each oufit has a ½-cubic yard portable mixer, with a Decauville car and tracks.

The floor of the wharf is 6 inches thick, heavily reinforced with twisted rectangular bars of steel and strengthened by 8 concrete beams, 3½ feet deep and 15 inches wide, ex-

NOTES OF PROGRESS.

(Continued.)

tending longitudinally. A single railway track of 70-pound rails is being set in the concrete, with its center 10 feet from the outer edge of the wharf.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 72 per cent completed, 163,293 cubic yards, out of a total of 225,000, having been placed at the close of work on December 2. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
November 27	116	5.30	1
November 28	38	3.00	1
November 29	....	....	....
November 30	....	....	....
December 1	96	5.30	1

December 1	7.10	3,192
December 2	8.35	2,614
Total	40.45	15,029

Cargo for Isthmus Aground.

The Chief Quartermaster has been advised by W. Andrews & Company, agents at Colon for the Munson Line, that the steamship *Moldegaard*, which sailed from Baltimore on November 19, bearing a considerable quantity of goods consigned to the Commission and the McClintic-Marshall Construction Company, went aground at Cat Island, in the Bahamas. The agents have received no further information than the cablegram, dated November 29. "*Moldegaard* ashore at Cat Island." The goods for the Commission were mostly coke, nails, steel plate, lard oil, paints, bolts nuts, rivets, vitrified pipe, tie plugs and 32,600 feet of oak lumber.

The *Moldegaard* was built in 1906 at Bergen, Norway, and registered there. It is a single screw vessel, 321 feet in length, 45 feet beam, and of the net tonnage of 1,754 tons. It has been sailing under command of Capt. P. Wiig.

New Fill North of Ancon.

The Central Division has begun, with spoil from Culebra Cut, a fill which is to extend over the triangular area enclosed by the main line of the Panama railroad, between Balboa Junction and Panama, the dirt train tracks which swing westward from Balboa Junction, and the Panama railroad line to Balboa, which intersects both of the former as it skirts Ancon Hill and runs approximately east and west. The area of the triangle is 61 acres. From its present average elevation of 6 feet above sealevel it is to be raised approximately 14 feet, so that about 1,380,000 cubic yards of earth will be used in making the fill. The surface will be sloped to drain towards the north, away from Ancon and Panama. Plans for drainage have not been completely determined. The area is crossed by a branch of the Curundu River and a number of tributary drains.

CONCRETE WORK IN THE LOCKS.

Over 72 per cent of the concrete for the locks is in place, the amount at the close of work on December 2, being 3,051,746 cubic yards, out of a total of approximately 4,199,400. A total of 20,663½ cubic yards of concrete was laid in the locks during the week ending December 2.

GATUN LOCKS.

Over 86 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on December 2 being 1,725,685 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending December 2, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone.	Total.

HYDRO-ELECTRIC PLANT.

Contracts Awarded for Machines at Gatun Power Plant.

Award of the contract for the hydro-electric power plant at Gatun has been authorized to the Pelton Waterwheel Company for the water turbines at $85,200; the General Electric Company for the generators at $54,534; and the Niles-Bement-Pond Company for cranes at a price to be determined after the power plant lay-out has been decided upon and the span of the cranes can be fixed. Three bids were received on the turbines, and three on the generators, and these permitted eight different combinations, of which the Pelton-General Electric, was the most advantageous. There were also three bids on the crane equipment.

Circular 648, under which the awards have been made, called for three classes of machines —(1) 3 water turbines of 2,250 k. w. capacity, 3 governors, 3 head gates, 3 penstocks, 3 compressed air regulators, and one lubricating system. (2) 3 electric generators of 2,000 k. w. capacity, 3 exciters of 50 k. w. capacity, 2 motor driven exciter sets of 100 k. w. capacity, (3) one 20-ton, 3-motor traveling crane.

The equipment is for the generating station that will furnish current for power to operate the gates, valves, and other machinery of the locks, the regulating works of the spillways of Gatun and Miraflores dams, and will furnish light for the same, as well as light and power along the Canal. Two proposals were requested, one for a plant to be installed in the center of the Dam at the Spillway and the other below the Dam at the Spillway, the theoretical advantage of the latter location being greater head. Water for both plants would be taken from Gatun Lake at the Spillway, where regulating gates will keep the maximum elevation as near 87 feet above sealevel as possible, and where, at the end of the four months' dry season, the water may fall as low as 79 feet above sealevel. From a concrete forebay in the Spillway dam, water will be carried in penstocks, equipped with headgates and regulators to the turbines.

For proposal No. 1, the average difference between the water levels in the lake and in the tailrace was estimated at 75 feet, and the turbines were rated on this basis, and were to be of the vertical type. For proposal No. 2, the turbines were rated upon the basis of an average difference of 83 feet in elevations.

The location referred to as No. 1, that is, where the power station is near the head of the Spillway and the tailrace arches already built in the Spillway wall can be utilized, has been decided upon. The amount of water available for power purposes when the storage of the lake has to be drawn down, that is during the dry season, will be 275 cubic feet per second. At the upper location 275 feet per second is equivalent to 2,342 horsepower, (theoretical) and will generate 1,390 k. w. at the switchboard. At the lower location the power would be 2,593 horsepower, and 1,536 k. w. respectively.

It is estimated that it would cost from $100,000 to $200,000 more to install the plant at the lower location. Even in unusually dry seasons there will be more water than will be required for all the lockages that time will permit. It has been determined, therefore, not to incur extra expense to obtain the additional head of 10 per cent at the lower site.

In the bid on which award has been authorized, the Pelton Waterwheel Company undertakes to furnish three single runner, scroll case, vertical shaft, turbines of 250 revolutions per minute, and other necessary items of Class 1 for $85,200. It guarantees satisfactory regulators with fly wheel effect of 600,000, without surge tank, and, if these machines are installed, recommends the omission of the proposed regulating system, which would effect a saving of from $7,500 to $9,000. Delivery is promised to begin in three months and end in five.

In Class 2 the General Electric Company undertakes to furnish three generators, 250 revolutions per minute, fly wheel effect of 600,000, weight 116,200 pounds together with other items in this class for $54,534. This type permits the omission of the mezzanine floor in the power house, the bearing for the rotating parts being located on the top of the generator case. Machines of this type have been in successful operation for four years, and a similar arrangement of the bearing is not unusual in vertical motor generator sets, where the weight of the rotating parts is greater than in the proposed combination of water-wheel and generator. The omission of the mezzanine floor in the power house results in a considerable saving in the cost of the building. Delivery under the contract will begin in 140 days and be finished in 200 days.

Teeth for Ladder Dredge Bucket.

In hope of augmenting the capacity of the ladder dredges, the Atlantic Division will experiment with teeth on the cutting edges of several buckets. As made at present, each bucket is provided with a sharpened edge of Manganese steel, 6 inches wide, around the circular front which scrapes into the rock. For the experiment, two teeth, 5½ inches long, 4 inches wide and 8½ inches apart, are riveted to the cutting edge. They are held in place by 30-inch shanks, which clasp the side of the bucket and are connected by 5 heavy rivets. The teeth are modeled on those of steam-shovel dippers and are wedge-shaped, with a base 4¾ inches through.

Five buckets so provided with teeth will be tried first on ladder dredge No. 1, working in rock at the Atlantic entrance. If the results are satisfactory all of the ladder dredges in use by the Atlantic Division may be similarly equipped.

Red Men Inter-Tribal Meeting.

There will be a joint meeting of all the Tribes on the Isthmus, in the Wigwam of Carib Tribe No. 7, at Las Cascadas, next Sunday, December 10, at 2.00 p. m.

Several matters of importance to every Tribe are to be brought up at this meeting, and it is earnestly requested that as many as can make it convenient, attend this meeting. Visiting Red Men are always welcome. Refreshments will be served.

W. H. Kromer, D. G. I.

Cristobal, C. Z. December 5, 1911.

The Royal Mail Steam Packet Company.

In the future the Royal Mail Steam Packet Company will grant a reduction of 25 per cent on all tickets, first or second class, to army officers, soldiers, their wives and children traveling on their line, which is the same rate that is granted to employes of the Isthmian Canal Commission and Panama Railroad Company. It will be necessary for all such officers and soldiers to produce a certificate from their commanding officer stating that the holder is entitled to the reduced rate.

Missing Men.

Any one having information regarding the present whereabouts of Samuel Morris, and Schuyler C. Vaterford, former employes of the Department of Building and Construction, will please communicate with John J. Keegan, Dania, Florida.

The committee that had in charge the collection of a purse of money for the widow of the late Capt. Edwin Hammond of the Panama Railroad Steamship line, has received a letter of acknowledgement from Mrs. Hammond.

Lost—I. C. C. service medal on Panama railroad train between Gatun and Colon on Thanksgiving day. Finder please return to C. D. Hunter, Cristobal.

THE LAKE VILLAGES.

Hamlets and Towns whose Sites Will be Covered by Gatun Lake.

The villages between Gatun and Matachin will be covered by the water of Gatun Lake. They have never been important in the sense of size, or as the center of any peculiar type of life. In fact they are little more than jungle hamlets, yet they have a distinct place in American history, because they were known to European civilization many years before Jamestown was settled or Massachussetts Bay was an English colony.

In THE CANAL RECORD of November 29, there was republished a letter in which attention was called to the fact that the names of some of these villages appeared on the map published with Esquemeling's narrative of the Buccaneers in 1678. Most of them antedate that time, for they were not named by the English who plundered with Morgan, but are spoken of in Esquemeling's book as places already known, and invariably they bear Spanish names. It is probable that most of them date from the early days of navigation on the Chagres River, when it was one of the most used routes for commerce across the Isthmus. Among these are Ahorca Lagarto, Barbacoas, Caimito, Matachin, Bailamonos, Santa Cruz, Cruz de Juan Gallego, and Cruces (Venta Cruz).

As early as 1530 Spanish ships sailed down the coast from Nombre de Dios and entered the Chagres, whence their goods were transferred to canoes and taken up the river as far as Cruces, a distance of 36 miles from the river mouth, near the point where Culebra Cut begins. From Cruces they were taken overland to Panama. At times of high water, when the stream could be navigated readily by shallow boats, this was the easiest route across the Isthmus, although the trails from Nombre de Dios and, after 1586, from Porto Bello were kept open and were much used by pack trains. The harbor at the mouth is not so safe as those of Nombre de Dios and Porto Bello, and yet that the trade by this route was not inconsiderable is attested by the fact that the entrance to the Chagres was guarded by a fort (San Lorenzo). The river hamlets were of the type of the settlements that grew up along the highways during the days of travel by coach and saddle, and their people probably subsisted as much by the trade they drove with travelers as by the products of their own fields. Yet Esquemeling speaks of cultivated fields, so there was undoubtedly some farming along with the travel trade.

The river trade became steadily less after the reign of Philip II, because Spain's monopoly was gone, and the all-water route to Peru by the Strait of Magellan was found less dangerous. But this was because the trade itself was less, for the Chagres route continued in use up to the time of the completion of the Panama railroad in 1855. Since then the villages in the lake region have been "way stations," with two brief periods of prosperity, one when the French were working nearby them, and the other when the Americans were carrying on their operations.

The region in which these lake settlements are situated will probably not be under water before August, 1912, but the railroad track will be torn up in February, and therefore the native hamlets and American canal settlements are being moved, the houses torn down to be erected again elsewhere, or in the case of shacks merely abandoned in the jungle. It is difficult to persuade some of the inhabitants that the inundation will ever take place. One old bush settler, after receiving repeated warnings heedlessly, ventured it as his opinion that the Lord had promised never again to flood the earth. Such people as these will be assisted in their moving, because the present hamlets will be isolated when the railroad is torn up and in case of a sudden rise in the river, with the backing up of water after the Gatun spillway dam is raised, it would be difficult to rescue them.

In this blotting out of the river hamlets and of one of the world's historic trade routes, nothing of value will disappear; only a few shabby hamlets, and a hundred or more isolated huts in the jungle; while the river route will give way to the Canal, and the railroad to a straighter and better line outside the lake area above all danger of flood.

In the hamlets and the jungle there are three distinct types of buildings, in addition to the quarters for canal employes. Of these the most picturesque and primitive is the open hut in the jungle, which consists of a palm thatch raised about eight feet above the ground on bamboo poles. Here a bush family has its incongruous being, for this jungle home is often within sight of the railroad trains, and within it one sees plantain being fried in a modern kettle over a modern brazier, while the drinking water is dipped with a gourd from a square, gallon capacity, oil can. A little more advanced type of dwelling is the pretty hut made of closely set bamboo sticks, sometimes plastered with mud, and with the broad overhanging thatched roof, in which lizards and bugs rustle about day and night. There are none of the more substantial native huts, found in some of the villages in the interior of Panama, built of clay blocks and covered with overhanging pantile roofs. The third type of house, although more modern, can scarcely be considered an advance on the bamboo hut. It is built of lumber and covered with a corrugated iron roof. Old residents of the Isthmus say that this type is due to the easy pilfering of lumber and roofing iron, left in storehouses and on isolated buildings by the French canal builders, and that it was unknown before 1885. Usually these buildings have been arrested in dissolution by patches of soap boxes or tin flattened out from old cans, which gives them a motley look. The village stores are little better than this latter type of dwelling. Here and there one sees in a settlement of such nondescript houses, the trim little cottages built by the French and more recently used by the Americans; and the more airy and well screened quarters of the American canal period. These, however, are late additions. The original villages were jungle settlements existing because of the isthmian transit.

The old village of Gatun, which lay on the river flats below the present town was abandoned in 1908, and the site is now covered by 80 feet of rock and earth under Gatun Dam. At the time it was abandoned, the village contained a church, priest's house, school, a dozen small shops, and ninety or more small houses of all descriptions, from the bamboo hut with palm thatch to the typical sheet iron roof shanty. Most of the buildings were moved to the new townsite, now known as New Gatun. The railroad line also ran through the dam site and as soon as the present line into Gatun was opened, this likewise was abandoned, and the station building was razed. By the middle of 1909 the last vestiges of the old village had disappeared before the encroaching work on the dam.

The antiquity of the place is uncertain, because none of its buildings were of masonry. In his narrative of the pirate Morgan's march to Panama in August, 1670, Esquemeling says "The first day they sailed only six leagues. and came to a place called De los Bracos. Here a party of his men went ashore, only to sleep and stretch their limbs, being almost crippled with lying too much crowded in the boats. Having rested awhile, they went abroad to seek victuals in the neighboring plantations; but they could find none, the Spaniards being fled. and carrying with them all they had."

The location on the river corresponds to that of Gatun, for six Spanish leagues equal about nine miles, and even if the situation of De Los Bracos is not identical with old Gatun the narrative indicates that the region thereabouts was somewhat settled. It is also known that the Spaniards had erected a fort on a hill 120 feet above the river, overlooking the town, which was probably one of the outposts they had established at various points along the isthmian trade routes. Evidences of the old fort are found to-day, and the site is shown on the original land map made for the Panama railroad in 1855. At that time the village had about one hundred buildings of all kinds. Writing of it in 1861 Otis says it was a village composed of forty or fifty huts of cane and palm. In the early days of the California immigration it was the first stopping place in the canoe journey up the Chagres, where "bongo-loads of California travelers used to stop for refreshments on their way up the river, and where eggs sold four for a dollar, and the rent for a hammock was two dollars a night."

In 1881 the French chose Gatun as the site for one of the canal residencies, erected machine shops there, and built a number of quarters for laborers, calling the new section, "Cite de Lesseps." This continued as a center of the work of excavation until 1888 when all operations ceased, not to be resumed here until 1904.

When the Americans arrived in 1904, Gatun was the center of a comparatively large river trade. Bananas and other produce from the Gatun, Trinidad, and Chagres Rivers were brought there for transhipment by rail, and for sale. Once a week, a shipment of from seven to nine carloads of bananas was made, and on the shipping day, as many as a hundred canoes would tie up at Gatun.

The next settlement of any importance up the river from Gatun is Bohio. Between these two villages are three hamlets, Lion Hill, Tiger Hill, and Ahorca Lagarto, none of them numbering over half a dozen huts and without any apparent reason for existing except that some bush negroes or natives happened to settle there. The two first mentioned are essentially railroad camps that have persisted since 1851, when they were successively the terminus of the road. Ahorca Lagarto, however, is on a bend in the river, and may well have been a resting place for the cramped travelers in canoes. Of the origin of its name Otis says: "Ahorca Lagarto, 'to hang the lizard,' deriving its name from a landing-place on the Chagres near by; this again, named from having, years back, been pitched upon as an encampment by a body of government troops, who suspended from a tree their banner, on which was a lizard, the insignia of the Order of Santiago." In 1908 it had sixty-two inhabitants,of whom three were white, two yellow, and the balance negro.

Bohio appears to have been another bush hamlet in 1862 when Otis wrote. Until recently it has been called Bohio Soldado (Soldier's Home). The French made it the site of one of their district headquarters in 1862, erected a machine shop on the west bank of the river, and did considerable work there under the old sealevel plan for a canal, which was excavated to this place to a sufficient depth for light draft boats. Here as well as at any place can be seen today the plan of the sealevel canal, which included the main channel and two large diversions or drainage ditches one on each side of the canal proper.

Under the French plan for a lock canal, Bohio was the site of the first dam, and the excavation for the locks at this point can be seen in one of the hills on the opposite side of the river from the railroad. As it has existed during the American regime the village has been a relic from the French period. Such surveys, investigations, and excavation as were necessary here were done by men occupying the French houses. In recent years Bohio has been the center of a small local trade in vegetables, brought in from the jungle by canoe and pack animals, in exchange for groceries and liquors sold in the Chinese and native shops. At the time of the official census in 1908, it had 526 inhabitants of whom 447 were colored and native, 69 white, and 10 Chinese.

At Bohio the Americans carried on investigations in 1904 and 1905 to determine whether that location could be used for locks and a dam, and in 1909 excavation by hand and with steamshovel was carried on to remove a small hill and part of a dump made by the French, which stood in the canal prism. Across the river, where the machine shops were situated in the French days, and where they carried on work for the lock emplacement, the edge of a hill is now being removed by a contractor. The work at this point is typical of all that between Gatun and Culebra Cut, consisting as it does of the excavation of small elevations in the Canal channel and the toes of hills that project into the prism.

Near Bohio are the hamlets of Penas Blancas and Buena Vista, both on the river, and each merely a collection of huts of various descriptions. Frijoles is the next railway station, a village of 784 inhabitants in 1908, of about a thousand when it became a center for relocation work on the Panama railroad, now being rapidly deserted. Here for many years an old Frenchman ran a distillery in which he made rum of such good quality that he boasted that it was sold in Colon to rectifiers who made it into "genuine French cognac." One of the familiar sights of this hamlet is the village washing place a pool near the railway tracks, formed by the swirling of the water in the Frijolita River at a point where it is turned at right angles to its previous course by the interposition of a bank of clay and rock. The method of washing clothes among the lower class natives and West Indians can be observed here. This also is locally known as the place where one may buy bananas of peculiarly delicious flavor.

Frijoles is mentioned in Otis' guide book published in 1862, but the next village, Tabernilla, although it appears on the Harrison-Arosamena map, is not. It was one of the centers of the French work, and there was a small field repair shop at this point, with a few buildings that served as quarters for the working force. During the American occupation it became a village of over two thousand inhabitants (2,079 in 1908), because here is situated the largest dumping ground on the canal work. The location was chosen in 1906 because it is on the main line of the railroad, outside the canal prism and afforded a plot of ground two miles long and almost as wide for wasting of spoil. In all about sixteen million cubic yards of material were wasted here, all of which will be below the level of the lake. The dump was abandoned at the close of 1910, and immediately the village population decreased, the people remaining there being largely employes with families who could not procure quarters elsewhere. These are now being moved because the demolition of the place is under way.

Between Tabernilla and San Pablo the railroad crosses the Chagres River at Barbacoas. The original bridge was built of wood but early in the history of the railroad it was replaced by a bridge of six wrought iron through plate girder spans ranging from 101 to 109 feet in length, supported upon seven masonry piers. This bridge is mentioned by Otis in 1862, and is said to have been one of the first of its type ever constructed. It was not built however to carry such heavy rolling stock as that placed on the road by the Americans, and so the three channel spans were replaced in 1908 by heavier girders, while the floor system of the three remaining spans of the old bridge was reinforced.

San Pablo was originally a plantation worked by Catholic priests. It was a railroad station in 1862, was a laborer's camp in the French days, and during the American occupation has been a small canal village. It also is being demolished, and the last excavation in the lake region is now in progress there. Across the Chagres river from San Pablo is Caimito, one of the names found on Esquemeling's map. It was a canal labor camp in the French time and also under the Americans until the work at that point was finished. Of this class, also, is Mamei, likewise a railroad station in 1862, and little more than that today, although it was the location of several quarters for Canal workers a few years ago.

Gorgona bears the name given by Pizarro to an island off the coast of Colombia, near Buenaventura, because he found around it such treacherous currents. It may be that this name was adopted arbitrarily, or that the Chagres river travelers found in the river at this place some eddies that reminded them of the currents at Gorgona Island. Of this place Otis says, "The native town of Gorgona was noted in the earlier days of the river travel as the place where the wet and jaded traveler was accustomed to worry out the night on a rawhide, exposed to the insects and the rain, and in the morning if he was fortunate regale himself on jerked beef and plantains." In the French time large shops were situated here, at the point where the American shops now are, known as Bas Matachin.

Gorgona should not be classed with Gatun and Bohio as a purely jungle hamlet because it appears to have been a settlement of some size long before the railroad was built. It was one of the places at which river travelers stopped for the night, and all about it were cultivated farms. At the time of the first Canal Zone census in 1908 its inhabitants numbered 1,065 whites, 1,646 blacks, and 39 Chinese, a total of 2,750. The population has increased owing to the expansion of work in the shops The site of the shops and the lower parts of the village will be covered by the water of Gatun Lake, and, therefore, the shops will be moved in about a year to the site reserved for the permanent marine shops at Balboa.

In The Canal Record of November 29, 1911, there was published an article telling of the origin of the name Matachin as applied to the village next to Gorgona. It was the place, half way between Panama and Colon, at which trains passed one another in the early years of the railroad. In 1908 it had 2,042 inhabitants of whom 698 were whites. Like all the lake villages it has experienced small booms according as the canal work has waxed or waned.

WOMEN'S CLUBS.

Activities of Canal Zone Organizations.

The activities of the women's clubs during the month of November have continued as usual. Some of the programs have been devoted to the discussion of national festivals, and all are looking to their share in the usual Christmas celebrations. The clubs are also preparing for the annual meeting of the Federation in January. At a meeting of the executive board held at Empire on November 6, plans for the convention were discussed and some of the details settled. Every effort will be made to make this a notable meeting in the history of the federation. Invitations to women's organizations in the Canal Zone will be extended. A program of music is promised for the afternoon session and there will be special speakers. The Cristobal club is in charge of the social arrangements. It is expected that the meeting will be held on Saturday, January 21.

The programs of the Cristobal Woman's Club in November were as follows: On November 15, under the home department, "Garbage Disposal;" on November 8, under the same department, "Home Life in Switzerland;" on November 15, an exhibit of the Federation art collection with papers on the world's masterpieces. The club has contributed over one hundred dollars to the anti-tuberculosis work in Colon as a result of the annual benefit ball in November. The home department is engaged in preparation for assisting the community in its celebration of Christmas. The program for this month is—December 6, "Primary Education;" on December 13, "Home Life in England;" on December 20, "The World's Great Cathedrals;" on December 27, a meeting of the executive board.

The Gatun Woman's Club held the first meeting in November at the home of Mrs. V. V. Sessions, under the home committee, and the social committee entertained on Thursday evening, November 22, when 50 persons were present. The club has appointed a committee to act with the playground association on the question of raising funds for the necessary repairs and maintenance of the playground. This playground was established in 1910, funds for the purpose being raised by a carnival. It has now become necessary to raise funds for the purpose of keeping the playground in repair. The first meeting of the club in December will be held at the home of the president, Mrs. Allen, on Thursday, December 7.

The programs of the Paraiso Woman's Club have included the discussion of current events, woman suffrage, and home sanitation. The club has started a plan for a general Christmas celebration for the children of the village, the means chosen being popular subscription and voluntary donations. For this purpose boxes are placed in conspicuous places to receive donations. It is expected that the response will be generous and as there was no celebration in the village last year, it is hoped to make this an especially successful one.

Church Notes.

A young people's Bible class has been organized at Gorgona with about 25 members, the object being to promote the attendance at the Sunday services in the chapel and to encourage the young people to meet together frequently in social intercourse. Miss Ruth Hackenberg is the president and Mr. E. M. Reinhold is the secretary. Mr. T. S. Booz is the organizer and class teacher. The society meets at the call of the president about every fortnight and a social meeting is held once a month.

St. Luke's Sunday School.

The eleven o'clock hour for holding the sessions of the Sunday school of St. Luke's Church, Ancon, has been found impracticable and beginning with Sunday, December 10, the school will be held from 9 to 9.45 a. m. as heretofore. The Sunday school is especially maintained for the children in the hospital grounds and those living near. The session is purposely short and there are three teachers. A Christmas celebration will be held in the church on December 28, for the children of the school. Christmas carols will be sung and there will be a short service.

Obituary.

Mrs. H. E. Cecil, mother of Clyde Cecil of Empire, died at Colon on November 26. She was born in Alabama 44 years ago, was a widow, and had been on the Isthmus eighteen months.

H. G. Benion, an employe of the Mechanical Division living at Empire, died on November 28 at Ancon Hospital. He was 32 years of age, and had been on the Isthmus a year and four months, coming here from Harrisburg, Pa. He is survived by his wife, who is living at Empire.

Edward Mc[illegible]vers, an employe of the Mechanical Division at Gorgona, died at Ancon Hospital on November 30 as the result of injuries received at the Gorgona shops on November 29. He was 43 years of age, married, and had been on the Isthmus 2 years, coming here from Jacksonville, Ill. He is survived by his wife.

United Spanish War Veterans.

Chagres Camp No. 2, U. S. W. V., will hold a meeting at 2.30 p. m., December 10, in the lodge hall at Culebra, when officers for 1912 will be elected.

The newly organized chapter of the Order of the Eastern Star, Gorgona No. 1, celebrated its first Thanksgiving day by a special meeting in the afternoon of November 30. A social meeting followed the business and refreshments were served. There were 53 present.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

GENERAL.

The following is the schedule of moving picture entertainments for the week of December 11 to 16: Monday, Culebra; Tuesday, Corozal; Wednesday, Empire; Thursday, Cristobal; Friday, Gorgona; Saturday, Gatun.

The MacWatters Male Quartet will sail for New York on the *Colon*, December 13, as owing to future engagements in their trip around the world they cannot make connections on a later boat.

There were 85 entries in the Isthmian Thanksgiving Tournament. A great deal of enthusiasm was shown at various points along the line. Details are given in the notes of the various clubhouses below.

The standing of teams in the Isthmian Basket Ball League on December 2, was as follows:

Team.	Won.	Lost.	P. C.
Cristobal..........	8	0	1.000
Culebra............	5	3	.625
Gatun..............	5	3	.625
Gorgona............	4	4	.500
Empire.............	1	7	.125
Corozal............	1	7	.125

Results of games played on December 2, were as follows: Cristobal, 19; Gorgona, 16. Culebra, 21; Gatun, 18. Corozal, 37; Empire, 15.

Games to be played December 9, are: Empire at Gatun; Cristobal at Culebra.

COROZAL.

The MacWatters Male Quartet will give a program of quartets, solos, duets and impersonations on Friday evening, December 8.

The Gorgona Minstrel show held on November 28 was attended by an audience of 275.

The plans for additions to the Corozal clubhouse have been approved and the bowling alleys and other equipment ordered. It is expected that work on the building will be begun in January.

CULEBRA.

A correction for the previous week's record in the billiard tournament should read games lost in place of won, and won in place of lost, reversing the standing. The present standing follows:

Name	Won	Lost
Dubois..............	5	0
Tragsdorf...........	4	0
Hepler..............	5	0
Vogel...............	4	1
McCann..............	5	4
Conlon..............	3	3
Peters..............	4	3
Janneys.............	3	5
Byer................	2	6
Hertz...............	1	5
Thomson.............	3	5
Case................	0	6

Following are the Thanksgiving bowling scores:

Singles—Case, 556; Herrington, 490; Dougherty, 513; Driscoll, 440; Warner, 462; Cushing, 390.

Doubles—Herrington and Warner, 972; Cushing and Case, 954; Conlon and Dundas, 960; Dougherty and Driscoll, 933.

Two hundred people attended the entertainment on Thanksgiving evening. The following program was rendered: Piano solo, Arthur Howard; Mandolin solo, Mr. Ramsey; mixed quartet, Madams Brown and Kramer, Messrs. Case and Kramer; bass solo, Mr. Walsh; mixed quartet; indian club swinging, illuminated, Mr. Kramer; contralto solo, Mrs. Kramer; popular songs. Refreshments of home made cake and lemonade were served.

EMPIRE.

The total number of entries for the Thanksgiving bowling tournament was 38, 16 in the singles and 22 in the doubles. The followng made highest scores in singles and doubles: Singles—Gorham, 557; Parkis, 532; Pinney, 499; Pearson, 499. Doubles—Peterson and Scull, 1,050; Davis and Spinks, 1,020; Gorham and Gustavson, 995.

The sacred concert on Sunday night, December 3, by the MacWatters Quartet was attended by 350 people. A short talk was given by Mr. Oakes and the audience joined in a number of songs. A program of secular music well be rendered by the quartet on Tuesday, December 12.

On Wedensday, November 29, there was a meeting of the chess players and a committee was elected to arrange for a local chess tournament to start at once. Twelve names have been handed in for this tournament.

GORGONA.

Three-hundred and seventy five persons were present at the first performance of the Gorgona Minstrels on Monday, November 27. The show is booked for Camp Otis, December 8; Culebra, December 12; Cristobal, December 15; Gatun, December 19; and a return engagement in Gorgona, December 22.

Friday night, December 1, the MacWatters Male Quartet made their initial appearance on the Canal Zone. Fully 250 persons spent the evening as the audience of this group of entertainers.

The Sunday song service was made unusually popular by the presence of the MacWatters Quartet. Six sacred numbers were rendered by them. One hundred and seventy-nine persons were present.

GATUN.

"Open House" was observed at the clubhouse on Thanksgiving Day. As usual, pool, billiards and bowling were played without charge. In addition to a large number of the members there were many visitors from out of town who called at the clubhouse. In the evening a concert was given by the Tenth Infantry Regimental Band, assisted by vocal soloists. The attendance was 350.

Culebra won the basket ball game with Gatun on Saturday night, December 2. The score was 21 to 18. One hundred and twenty-five people attended.

The gymnasium class will meet on Wednesday night this week at 8 o'clock.

A few new members were added to the Choral Club which met Monday evening, December 4.

Gatun clubhouse expects to have William Jennings Bryan in a lecture in the latter part of December.

The results of the local bowling tournament held on November 30 are as follows: Doubles—Walters and Barte, 550; Dickson and DeMoll, 548; Teall and Wells, 546; DePoorter and Dalton, 543; Green and Wurster, 525. Singles—DePoorter, 287; Dalton, 284; Wurster, 283; Dickson, 276; Walters, 262; Severn, 258; Wells, 251; Green, 245, Teall, 244: Myers, 218.

A meeting of the Executive Council was held on Friday evening, December 1. Dan S . Clair was elected vice-chairman in place of R. M. Sands, resigned. There were present Messrs. Huber, Windes, Gayer, Shuck, Gamble, Sicean, and Secretary Smith. Reports of the activities of the clubhouse were given.

CRISTOBAL.

There was an attendance of 90 at the illustrated lecture on "California" given by E. G. Dauphine on Friday evening, December 1.

The next topic to be discussed by the Club on Christian Sociology, Monday evening, December 11, is, "Economic Causes of Tuberculosis." Leader, W. E. Burrell, Assistant Secretary.

The subject chosen for debate at the Debating Club's session to be held on Wednesday evening, December 13, is "Resolved that circumstantial evidence should have no weight in cases where capital punishment is involved." Messrs. Morrison and Cousineau, affirmative Messrs. Brown and DeLong, negative. All men are invited to attend.

The basket ball game Saturday night was won from Gorgona by a score of 19 to 16.

Rag-time tournaments in candle pins, duck pins and ten pins, were started on December 1, and will close December 31. The leaders on December 2, in each of these events were as follows: Candle pins—Louch and Schofield, 524. Duck pins—Bullard and Collins, 587. Ten pins—Gibson and Collins, 1,015. Prizes will be given to the teams making the highest scores in each of these tournaments. All members of the Cristobal Y. M. C. A. are invited to participate.

The members of the local bowling teams showed good results on Thanksgiving Day, and the following won prizes in the Isthmian championship ten pin tournament: A. M. Gibson, first in singles, 583, silver cup; D. F. Rabbitt and E. B. Thomas, first in doubles, 1,087, silver cups; H. A. Collins and J. W. Barrett, second in doubles, 1,065, gold medals; A. M. Gibson, high score for day, 240, silver medal; Val O'Shea, (class B) first, 420, box of cigars.

The following high scores were made on the local alleys for the week ending December 2: Duck pins—Smith, 107, 100; Barrett 113, 107, 103, 109; Vanderberg, 106, 107, 113; Farrel 100; Grover, 101; Collins, 105, 109; Marquez, 107; Louch, 104, 104; Cotton, M. 107; Bullard, 103, 103; Herrington, 105; Wheeler, 100, 113. Ten pins—Rabbitt, 203, 228, 207; Bullard, 224; Burns, T. 228; Barrett, 202, 208; Gibson, 240; Thomas, 207, Collins, 200, 210; Beattie, 208. Candle. pins—Louch, 105.

Sale at Public Auction.

There will be sold at Public Auction, by the District Quartermaster, at the old corral, Ancon, 2 p. m., Saturday, December 23, 1911, to the highest bidder, for cash, the following Isthmian Canal Commission property: Ten (10) mules, (American) and one (1) pony, (native). The Government reserves the right to accept or reject any or all bids. For further information, apply to District Quartermaster, Ancon, Canal Zone.
C. A. DEVOL, *Chief Quartermaster.*

LOST—Silver filigree Waterman fountain pen engraved with initials "W. V. L." Finder please communicate with Dr. William V. Levy, Tabernilla.

OFFICIAL CIRCULARS.

Rules Governing the Performance of Work by the Construction Divisions for the Department of Sanitation.

CULEBRA, C. Z., December 1, 1911.

CIRCULAR No. 183-F-3.

Effective this date, the following rules and regulations shall govern the performance of drainage and ditching work by the construction divisions for the Sanitary Department.

MAPS OF DRAINAGE SYSTEMS CARED FOR BY THE SANITARY DEPARTMENT.

1. Existing maps of sanitary drainage systems shall be extended so as to include all drains now cared for by the Department of Sanitation.

2. A uniform system of marking all sanitary ditches shown on the map shall be adopted, viz: The main ditches of any drainage system to be denoted by capital letters. Starting from the outlet of a main ditch and proceeding upstream, the ditches on the right shall be given even numbers, and those on the left odd numbers. For instance, on ditch system "A," the first ditch on the right starting upstream from the outlet of ditch "A" shall be marked "2," the first branch of ditch "2" shall be marked "4," the second branch "6," etc. If this ditch has only two branches, in returning to the main ditch "A" and proceeding along "A" upstream, the next ditch on the right would be marked "8," its first branch "10," etc. Where a ditch is to be installed between two existing branch ditches, as, for example, between ditches "5" and "7," such ditch shall be numbered "5-a," etc. Its first branch shall be numbered "5-b," etc., using small letters and not capitals.

3. As soon as a new ditch, ditching system, or permanent lining of a ditch has been completed in accordance with a request on Form (159-C. E.), the Division Engineer shall have same located on the map of sanitary drains. Also in case any ditch is filled up or abandoned the office of the Division Engineer shall have such fact indicated on the map.

4. When any ditch or section of ditch, is abandoned, such ditch as shown by map, shall be cross-hatched. The legend on the map shall show that such marking indicates an abandoned ditch.

5. Two blue-prints of sanitary drainage maps shall be furnished the District Sanitary Inspector. One copy shall be at all times available at the office of the District Sanitary Inspector.

6. When a new ditch has been completed or an old ditch abandoned, the District Sanitary Inspector will request the office of the Division Engineer to furnish him with a corrected blue-print (showing the addition or change). Upon receipt of same he will return to the Division Engineer the uncorrected map in his possession.

7. The Division Engineer will supply each District Sanitary Inspector with a list of all ditches in the sanitary district. Such list shall indicate the length of each ditch and the lengths of the respective branches thereof.

8. When a ditch is abandoned, the District Sanitary Inspector shall mark on such list the date when such ditch was abandoned. He shall also mark on the list the date of completion of newy installed ditches.

9. All maps of sanitary ditches shall contain a legend which will indicate the character of each ditch, showing whether it is an open drain, tile drain, or concrete-lined drain, etc.

MAINTENANCE OF DRAINS AND DITCHES.

10. Requests for maintenance of ditches shall be specific as to the character of work to be performed and shall be so worded as to leave no doubt whatsoever as to the nature or kind of work that it is desired to have accomplished.

11. District Sanitary Inspectors shall, as far as possible, keep the representative of the Division Engineer advised—by information in advance—as to what force of laborers will be required for maintenance of sanitary ditches, and shall confer with him at frequent intervals with the view of having the work performed as economically as is consistent with sanitary results to be obtained. It is desirable, as far as possible, to keep laborers on the job who know how to clean and maintain ditches, and who take an interest in such work. Laborers who are new to the work do not give as satisfactory and economical results as specially trained laborers do.

12. Maintenance of ditches shall be performed by a ditching gang. One such gang to be employed in each sanitary district.

13. The foreman of the ditching gang shall perform the work in a manner satisfactory to the District Sanitary Inspector, and carry out his instructions. In case the foreman does not carry on the work in a satisfactory and economical manner, it shall be the duty of the District Sanitary Inspector to notify the representative of the Division Engineer.

14. The District Sanitary Inspector shall inspect the work as it progresses and shall indicate to the foreman exactly what work is desired and the manner in which it shall be performed.

15. Ditches shall be swept with stiff brooms, when in the opinion of the District Sanitary Inspector such treatment is necessary for the removal of algæ, etc., and when the work request so specifies.

16. Ditching tools must be kept sharp and in proper shape. Stiff brooms for ditch cleaning and hoes shall be kept on hand in all sanitary districts.

17. The foreman of the ditching gang shall notify the District Sanitary Inspector the day before the ditching gang is to be moved to a new piece of maintenance work.

18. If emergency work prevents the ditching gang from being employed on ditching work, the representative of the Division Engineer will notify the District Sanitary Inspector to that effect.

(*a*) Established slopes of ditch banks and grade of bottom of ditches should not be changed unless such changes are specified in the work request.

(*b*) Obstructions and vegetation only should be removed.

(*c*) Ditches must not be deepened unless work request so specifies.

(*d*) Low places and holes should be filled.

(*e*) Dirt taken from ditches must not be piled so that it will be washed back into the ditch by the next rain.

(*f*) Dirt must be so placed that it will not prevent surface water from reaching the ditch.

(*g*) A clear space should be left at the sides of ditches so that the oiling gang can work freely.

(*h*) Clear all wet areas at sides of ditches and streams.

(*i*) Too much digging should not be done where filling is required.

(*j*) Banks that have a tendency to cave in or to be washed can often be advantageously protected by facing with available stone. Washouts should be filled with stone.

(*k*) Prevent the formation of holes or pockets.

(*l*) Small pockets must receive prompt attention.

(*m*) More satisfactory work can be accomplished if there is closer cooperation between the representative of the Division Engineer and the District Sanitary Inspector.

RULES AND INSTRUCTIONS REGARDING CONSTRUCTION WORK.—OPEN DITCHES AND EXCAVATION.

19. The slopes of sides of ditches and the grade of ditches shall so far as possible be made as shown on approved plans and profiles.

20. The material taken from any ditches being excavated shall be so placed that it can not wash back into the ditch and so that it will not cause pools of water to collect, or prevent surface water reaching the ditch.

21. In borrowing material for fills, care must be taken so that:

(*a*) The borrow pit will not hold rain water.

(*b*) Seepage water is not tapped by the excavation, thus causing new anopheles production areas to exist.

CONCRETE LINING FOR DITCHES.

22. Whenever seepage water outcrops near or at the sides of ditches, sufficient weep holes shall be built into the concrete lining. Such weep holes shall be located in the side walls only. They shall slope downward toward the surface of the ditch floor.

Key walls shall be used where necessary and when specified on approved plans. A weep hole shall be located in the concrete ditch wall, close to and on the upstream side of each key wall.

Whenever a pipe line crosses a ditch (and is in the plane of its cross-section, thus acting as an obstruction) the ditch shall be widened at such place before the concrete lining is installed.

23. Where possible, branch ditches shall enter the main ditch at an acute angle and the main ditch shall be made wider at such points.

24. On sharply curved sections of ditches, the outer wall shall be raised to prevent the water climbing over it.

25. At the junction of branch and main ditch the wall opposite outlet of branch shall be raised.

26. It shall be the duty of the Sanitary Inspector to list all necessary repairs to concrete ditches at the end of each rainy season, and have such work accomplished during the dry season, so far as possible.

TILE DRAINAGE.

27. The bottom of the trenches shall be true grade.

28. The tile shall be laid to a true alignment and wedged into place with small stones.

29. The trenches shall be no wider than absolutely essential and tile spades shall be used for this class of work.

30. The cover stone shall be properly packed above the tile.

31. The tile shall be laid with open joints, ⅛-inch to ¼-inch open space between consecutive lengths of tile, except in such material as requires close joints to avoid filling up the tile with washed-in material.

32. Where soft spots occur in the trench they shall be filled with broken stone well tamped, so as to produce a stable foundation before the tile is installed.

33. The cover stone shall completely fill the trench and extend slightly above the ground surface.

SPECIAL WORK.

For such work, either maintenance or construction, as requires special treatment and instructions the same should be prepared in writing by the Chief Sanitary Officer, or his authorized representative, and copies furnished to the District Sanitary Inspector and the proper representatives of the Division Engineer.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.

Acting Chief Sanitary Officer.

CULEBRA, C. Z., November 28, 1911.

CIRCULAR No. 422.

During the absence of Col. W. C. Gorgas, Chief Sanitary Officer, beginning November 28, 1911, Lieut.-Col. John L. Phillips is designated as Acting Chief Sanitary Officer.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Cost of Tools, Templets, Dies, Etc.

CULEBRA, C. Z., November 28, 1911.

CIRCULAR No. 264-B.

Circular No. 264-A, dated January 19, 1911, is hereby amended, effective December 1, 1911, so as to require the cost of all tools, templets, dies, fixtures, jigs, etc., to be charged to shop expense, with the single exception that the cost of tools, etc., of special character, that are made for use on work done for private individuals or companies, will be charged directly to the job.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Water Service and Electric Current for Church Buildings.

CULEBRA, C. Z., December 5, 1911.

CIRCULAR No. 423.

It is impracticable to approve hereafter any requests for free water service or for electric current without charge, to any churches or church buildings not owned by the Isthmian Canal Commission.

GEO W. GOETHALS,
Chairman and Chief Engineer.

Misdirected Letters.

ANCON, C. Z., December 4, 1911.

The following insufficiently addressed letters originating in the United States and its possessions have been received at the office of the Director of Posts and may be secured upon request of the addressees:

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Hotel Tivoli, Ancon, C. Z., Sunday, December 10, 1911, at 7.30 p. m. The program follows:

1. March—*Inspector General*............... Losey
2. Selection—*Naughty Marietta*.......... Herbert
3. Waltz—*Farewell to Munich*............. Gung'l
4. Overture—*Jeanne Maillotte*............ Reynaud
5. (*a*) Medley March—*Stop, Stop, Stop*...... Berlin
   (*b*) Cake Walk—*A Coon Band Contest*..... Pryor
6. Duet for Cornets—*Bolero*................ Hall
   Messrs. Bernell and Sanmartin.
7. Intermezzo—*Gretchen*.................. Martin.
8. Medley Selection—*Sterns' American-European Hits*.......... Williams
9. March—*Up the Street*.................. Morse

CHARLES E. JENNINGS, *Musical Director.*

The next concert will be given at Culebra, on December 17, at 5.45 p. m.

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning December 2, 1911.

FRESH MEATS.

	Price.
Mutton—Stewing, per pound	6
Shoulder, neck trimmed off, (4 pounds and over), per pound	9
Entire forequarter (not trimmed), 10 pounds and over, per pound	8
Leg (8 to 10 pounds), per pound	17
Cutlets, per pound	18
Short cut chops, per pound	20
Lamb—Stewing, per pound	6
Entire forequarter, neck trimmed off, per pound	9
Leg (5 to 8 pounds), per pound	20
Chops, per pound	24
Cutlets, per pound	24
Veal—Stewing, per pound	10
Shoulder, for roasting (not under 4 pounds), per pound	12½
Chops, shoulder, per pound	16
Chops, per pound	24
Loin, for roasting, per pound	24
Cutlets, per pound	28
Pork—Loin chops or roast, per pound	20
Beef—Suet, per pound	2
Soup, per pound	5
Stew, per pound	8
Corned, No. 1, per pound	12
Corned, No. 2, per pound	10
Chuck roast (3 pounds and over), per pound	12
Pot roast, per pound	12½
Rib roast, second cut (not under 3½ pounds), per pound	16
Rib roast, first cut (not under 3 pounds), per pound	18
Sirloin roast, per pound	19
Rump roast, per pound	19
Porterhouse roast, per pound	20
Steak, chuck, per pound	12½
Round, per pound	13
Rib, per pound	18
Sirloin, per pound	19
Rump, per pound	19
Porterhouse (not less than 1½ pounds), per pound	20
Tenderloin (Western), per pound	24

MISCELLANEOUS.

Caviare, Russian, per tin	47, 89
Livers—Beef, per pound	7
Calf, each	60
Half, each	30
Steak, Hamburger, pkg	13
Sausage—Bologna, per pound	10
Frankfurter, per pound	12
Lieberwurst, per pound	10
Devonshire Farm, per pound	17
Sweetbread—Veal, per pound	1.20
Beef, per pound	25
Eggs, fresh, dozen	†39
one-half dozen only	†20
Bluefish, fresh, per pound	14
Halibut, fresh, per pound	15
Oysters, 1 qt. kegs, per keg	50

POULTRY AND GAME.

Chickens—Fancy roasting, milk fed, large, each	1.35
Fancy roasting, milk fed, med., each	1.00
Fancy roasting, corn fed, about 4½ pounds, each	90
Fowls, each 60, 70, 80, 90,	1.00
Ducks, Western, about 4½ pounds, each	1.00
Broilers, milk fed, each	70
corn fed, each	60
Turkeys, per pound	28
Squabs, each	35
Capons. each	2.10
Partridges, each	50
Grouse, each	50

CURED AND PICKLED MEATS.

Ham—German, Westphalia, per pound	36
Sugar cured, per pound	20
Sliced, per pound	22
Half, for boiling, per pound	21
Boiled, per pound	28
Hocks, per pound	‡8
Todd's Smithfield Virginia, per pound	30
Bacon—Breakfast, whole piece, per pound	23
Breakfast, sliced, per pound	24
Pork, salt family, per pound	13
Ox tongues, each	1.00
Pigs' feet, per pound	9
Tongues, per pound	18
Sliced bacon in 1-pound tins, per tin	30
In 1-pound jars, per jar	30

DAIRY PRODUCTS.

Butter—Creamery special, per pound	†39
Cheese—Roquefort, per pound	45
Philadelphia cream, cake	10
Young America, per pound	20
Swiss, per pound	26
Edam, each	1.00
Neufchatel, cake	6
Gouda, per pound	34
Milk (Certified), per bottle	**25
Buttermilk, bottle	**15
Fer-mil-lac, bottle	**25

	Price.
Ice cream, quart	‡25
½-gallon	‡50

VEGETABLES AND FRUITS.

Beets, per pound	3
Celery, per head	6
Cabbage, per pound	4
Cucumbers, per pound	12
Carrots, per pound	3
Cauliflower, per pound	7
Egg Plant, per pound	10
Lettuce, per pound	*12
Onions, per pound	3½
Pumpkin, per pound	3
Potatoes, white, per pound	3½
sweet, per pound	2
Parsnips, per pound	4
Parsley, per pound	10
Squash, per pound	3
Turnips, per pound	3
Yams, per pound	3
Apples, per pound	5
Cranberries, per pound	9
Grapes, per pound	10
Grapefruit, each	4
Lemons, dozen	24
Limes, per 100	80
Oranges, per dozen	12
Peaches, pound	12
Plums, per pound	10
Pears, per pound	10

Supplies for Canal Work.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon, and Balboa, during the two weeks ending December 2:

Advance, November 19, from New York, with 42 kegs bolts, for Atlantic Division; 84 kegs bolts, 140 kegs bolts, 114 barrels leadite, for Pacific Division; 12,000 pieces vitrified conduit, for Atlantic Division; 36 pieces locomotive tires, for Mechanical Division; 50 pieces steel beams, 6,500 pieces building tile, for Panama Railroad Company; 42 crates galvanized pails, 60 kits shellac, 17 bales excelsior, 7 drums zinc, 100 cases candles, 50 bundles pipe fittings, 100 kegs boat spikes, 150 bundles wire, 49 cases window glass, 56 pieces steel plates, 13 barrels lead bends, 21 bundles handles, 10 cases rubber hose, 420 bundles shovels, 600 rolls roofing paper, 14 cases scythe stones, for stock; and a miscellaneous cargo, the whole consisting of 20,811 packages, weighing 400 tons.

San Jose, November 21, from San Francisco, with 14 bales dredging sleeves, for Atlantic Division.

Lewis Luckenbach, November 21, from Philadelphia, with 49 barrels ammonia alum, 239 barrels sulphate alumina, 10 cases neatsfoot oil, for stock.

Cuzco, November 23, from Tacoma, with 4,000 sacks oats, 9,612 pieces Douglas fir lumber, for stock; 12 pieces spud timbers, 19 pieces dipper handle timbers, for Atlantic Division.

Turrialba, November 23, from New Orleans, with 150 bags dairy feed, 16 bags wheat, 35 pieces piling, 4,252 pieces yellow pine lumber, for stock; 404 pieces yellow pine lumber, for Atlantic Division; 4,009 pieces yellow pine lumber, for Mechanical Division; 1,147 pieces creosoted ties, for Panama Railroad Company; 30 packages castings, for Pacific Division.

Almirante, November 23, from New York, with 100 cases toilet paper, 200 cases turpentine, 10 cases steel files, 12 cases carbon paper, for stock.

Eastlands, November 23, from Gulfport, with 533 pieces untreated piling, for Atlantic Division; 969 pieces untreated piling, for stock.

Panama, November 24, from New York, with 46,283 pieces vitrified duct, 12 barrels electrical material, for Atlantic Division; 12 pieces steel plates, for Pacific Division; 2,000 pieces building tile, for Panama Railroad Company; 16 cases fire bricks, 48 bundles car wheels, 30 cases brake shoes, 774 bundles castings, for Mechanical Division; 8,000 pieces building tile, 10 cases rubber hose, 34 pieces railroad frogs, 105 bundles switches, 20 reels wire rope, 103 pieces steel plates, 500 pieces iron pipe, 179 bundles galvanized sheets, 75 cases caustic soda, 340 barrels screw spikes, 60 cases metal polish, 15 cases insulated wire, 207 bales brooms, 120 bundles wire, 50 cases Ivory soap, 36 cases mower parts, 10 bags hulled oats, 492 rolls roofing paper, 45 cases japan dryer, 200 kegs red lead, 160 bundles roofing iron; and a miscellaneous cargo, the whole consisting of 60,126 packages, weighing 765 tons.

Pennsylvania, November 27, from San Francisco, with 9 bales rubber hose, for Atlantic Division; 8 bundles stove elbows, for stock.

Ancon, November 30, from New York, with 121,156 bags cement, for Atlantic and Pacific Divisions.

Heredia, November 30, from New Orleans, with 460 pieces C. I. pipe, 44 rolls cotton duck, 6 cases hardware, 7,358 pieces lumber, 95 pieces piling, for stock; 35 pieces piling, 88 bundles steel plates, 110 bundles washers, 66 pieces brackets, for Atlantic Division; 2,443 pieces lumber, for Mechanical Division; 790 pieces creosoted ties, for Panama Railroad Company.

Santa Marta, November 30, from New York, with 10 cases linoleum, 99 kegs boat spikes, for stock.

Maude, December 1, from New York, with 94,013 bags cement, for Atlantic and Pacific Divisions.

Allianca, December 1, from New York, with 8 barrels chain, for Pacific Division; 430 pieces castings, 45 bundles castings, for Mechanical Division; 30 cases cartridges, for Department of Civil Administration; 80 cases acid, 21 cases drugs, for Sanitary Department; 17 bundles baskets, 43 cases wrenches, 10 cases oil, 20 coils rope, 150 cases varnish, 10 cases electric material, 10 cases pipe fittings, 116 pigs lead, 75 cases soap, 180 pieces switches, 747 pieces iron pipe, 10 reels wire rope, 163 cases soda, 9 cases machinery, 13 cases brushes, 11 cases waste, 38 barrels rosin, 17 cases washers, 15 cases stationery, for stock; and a miscellaneous cargo, the whole consisting of 3,430 packages, weighing 320 tons.

MOVEMENT OF OCEAN VESSELS.

The following is a list of the sailings of the Panama Railroad Steamship Company; of the Royal Mail Steam Packet Company; of the Hamburg-American Line, and of the United Fruit Company's Line.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, DECEMBER 13, 1911. No. 16.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Address all Communications

THE CANAL RECORD,

Ancon, Canal Zone,

Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Construction Bridge Over Gatun Locks.

Plans are in preparation for a temporary railroad bridge over the locks at Gatun for the purpose of giving access to the dam, after the water in the lake has risen and covered the location of the present tracks that join the main line of the railroad with the system of tracks on the toes of the dam. Incidentally the new bridge will make it convenient to abandon the Mindi spur track by which the dam is connected with the main line on the north end. This track crosses the Canal and if kept in commission would hinder dredging between Gatun Locks and the Atlantic entrance.

Canal Work in November.

The grand total of Canal excavation to December 1 was 155,653,664 cubic yards, leaving to be excavated 39,669,715 cubic yards, or about one-fifth of the entire amount for the completed Canal.

The total for November was 2,599,922 cubic yards, as compared with 3,006,037 cubic yards in November, 1910, and 2,458,152 cubic yards in November, 1909.

The dry excavation amounted to 1,392,437 cubic yards, and was principally by steam shovels. The dredges removed 1,155,860 cubic yards, and 2,960 cubic yards were sluiced in the Central Division, and 50,563 cubic yards in the Pacific Division, in addition to the amount pumped into Gatun Dam by suction dredges. The progress on the locks at Gatun, Pedro Miguel, and Miraflores is referred to elsewhere in this issue.

In the Atlantic Division, the total excavation was 796,961 cubic yards. Of this total, 54,719 cubic yards were dry excavation, and the remainder was removed by dredges in the Atlantic entrance.

The total excavation in the Central Division was 1,221,746 cubic yards, all of which was from the prism. The amount taken from Culebra Cut was 1,209,498 cubic yards, as compared with 1,209,554 cubic yards in November, 1910.

In the Pacific Division, the total excavation was 581,215 cubic yards, 413,618 cubic yards of which were taken out by dredging at the Pacific entrance, and 50,563 cubic yards by the hydraulic plant below Miraflores Locks.

A detailed statement of the excavation, and a summary of the work on the locks and dams, follow:

Mean rainfall along Canal (eleven stations), 11.92 inches.

By "Work" excavation is meant excavation actually made for one of the constituent parts of the Canal, such as prism, diversions, or locks, etc.; that is, it represents material taken from the area to be occupied by the Canal and constitutes excavation useful for the completed Canal.

By "Plant" excavation is meant excavation outside of any of the constituent parts of the Canal, such as prism, diversions, or locks, etc. It includes material necessary to be excavated for construction purposes only, and is chargeable against the particular plant item for which it is performed, such as prism, diversions, locks, etc.

Test of Sun Valves.

The work of installing temporary acetylene lights in the two reinforced concrete towers which form Range No. 9-11 in the Pacific Division will be begun this week, and it is expected that the lights will be in operation within a few days.

In connection with this installation it is proposed to test a patent sun valve, which is said to reduce very considerably the consumption of gas. The valve operates upon the principle of a copper cylinder expanding when light falls upon the apparatus, closing a valve, and thus shutting off the flow of gas to the burner. A small pilot flame is left burning. When the light rays are shut off from the apparatus the cylinder contracts, the valve is opened by means of a spring and the gas is allowed to flow into the valve chamber whence it passes out to the burner. Thus during clear weather the main supply of gas will be automatically shut off for about ten hours during the day.

Should the test of the sun valve prove successful its adoption will materially reduce the initial cost of installation, in addition to the constant saving in the consumption of gas.

The naked flame of the lights in this range will be about 20 candle power, which when projected through a locomotive type of headlight will produce about 4,000 candle power.

Culebra Cut.

Work will be begun next week on an incline leading from Culebra Cut to the main line of the Panama railroad at Bas Obispo, in order that there may be a means of hauling out the small amount of spoil remaining after the inclines at both the north and south ends of the Cut have been excavated. The present inclines, that recently completed and now in use opposite Bas Obispo, and that just commenced at the south end near Pedro Miguel, are partly within the canal prism, and will have to be excavated as the work nears completion, but the new incline on the west side at Bas Obispo will be entirely without the prism. It will have a grade of four per cent.

The double track incline on the east side at Bas Obispo has been in use a week. It has a maximum grade of 2 per cent and three locomotives are required to handle a train of 21 nineteen yard cars up the incline. On the south end the incline has a one per cent grade and two locomotives are required.

At the beginning of December there had been excavated from Culebra Cut 72,151,742 cubic yards of material, and there remained to be excavated 17,292,263 cubic yards.

In order to relieve the pressure on the slide just north of the Central Division offices, on the west side of Culebra Cut at Empire, the crest of the bank just above the slide was blown off on December 9. Seven hundred pounds of dynamite, distributed among twenty-eight 24-foot holes, were exploded simultaneously. It is believed that this "broke the back" of the slide. A short time previous it was necessary to remove from the

NOTES OF PROGRESS.

(*Continued.*)

area threatened by the slide a 4,000-gallon and a 1,000-gallon oil tank. The earth on which they stood is now slipping into the Cut.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 72 per cent completed, 164,185 cubic yards, out of a total of 225,000. having been placed at the close of work on December 9. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
December 3	124		
December 4	134	8.00	2
December 5	48	2.00	1

Chain Fender Machines.

Award has been authorized for 48 machines, for lifting and lowering the fender chains in the locks, to the United Engineering and Foundry Company for $428,005, the lowest of ten bids received. The next lowest bid was $490,226.87 and the others varied between this and $819,800, the highest. The first or sample machine is to be delivered within 120 days from the date of award, and if it proves satisfactory, the full award of 47 more machines will be made. The deliveries on the final award are within 210 days at Gatun, 240 days days at Pedro Miguel, and 300 days at Miraflores.

The contract includes, besides the machine to lift and lower the chains, castings for hawse pipes, structural materials, operating valves, piping and fittings, and mechanism for starting and stopping the pumps. It does not include the main pumps and motors, electrical machinery and wiring, the fender chains themselves, suction tanks, resistance valves, stairways and gratings, drainage pumps and motors, and riveted steel anchorages for attaching to hawse pipe castings.

An article descriptive of the fender chains was published in THE CANAL RECORD of October 4, 1911. The function of these fenders is to prevent the lock gates from being rammed by a ship that may approach too near under its own steam, or by escaping from the towing locomotives.

Members of the Illinois Manufacturers' Association and their friends, forming a party of about two hundred persons, will spend two days on the Isthmus in January.

CONCRETE WORK IN THE LOCKS.

Over 73 per cent of the concrete for the locks is in place, the amount at the close of work on December 9. being 3,077,366½ cubic yards, out of a total of approximately 4,199,400. A total of 25,890½ cubic yards of concrete was laid in the locks during the week ending December 9.

GATUN LOCKS.

Over 86 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on December 9 being 1,735,797½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending December 9, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

NAOS ISLAND BREAKWATER.

Effect of Dumping Dredged Rock—Work on Double Trestle Begun.

During the low tide of December 7 an examination was made of the Naos Island breakwater at the Pacific entrance to the Canal, especially of that section between the end of the present trestle and the island. In this section the Pacific Division has been dumping rock from the dredging at Balboa since November 1. It was found that through this dumping a fill had been made about 800 feet long, 200 feet wide at the base, and from one to eight feet above water at extreme low tide, and that this extended from the end of the trestle to the shoal water near the island, there being left only one deep place on the line of the breakwater.

The driving of piles for the double trestle has been begun. It will be made upon the fill mentioned above, and it is believed that less trouble will be experienced in making it stand, since the base of the fill is heavy and broad. The Pacific Division scows dumped 38,000 cubic yards of rock on the line of the breakwater in November, and during the present month this filling is continuing at the rate of from 2,000 to 2,500 cubic yards a day.

It has been decided to change the direction of the breakwater slightly as it approaches the island so that it will connect with the island at the eastern extremity of its north end. This will be done in order that a site for a permanent dock at the north end of the island may be left. The site for the new dock may be reached by small boats without being exposed to rough weather or the fire of an enemy, and there is a natural channel 15 feet deep at mean tide leading from the Canal which can be dredged economically to greater depth, because the material is soft.

Air Compressors for Miraflores.

The work in Culebra Cut north of Las Cascadas has reached such a point that less compressed air is now required, while the pressure at Miraflores Locks has been too low for the efficient operation of rock drills. On this account a battery of two air compressors with their boilers will be moved from the Las Cascadas plant and installed at Auga Dulce at the south end of the Miraflores Lock site.

The compressor to be moved first will be installed at the Agua Dulce pumping plant, and for the present the boilers now at the plant will supply steam. An 8-inch main will be laid at once northward along the west side of the lock site to connect with the present 7-inch air main from the Rio Grande Compressor. There will be outlet tees at 500 foot intervals. An investigation is now under way to determine whether the boilers in the Las Cascadas plant can be safely worked at 150 pounds pressure per square inch, and if they can be then only two of them will be transferred to the new compressor site. If they cannot be so worked then three will be transferred. After the boilers are moved, the second compressor will be transferred, and then a 6-inch main will be laid southward from the pumping station to the dike which has been thrown across the channel to permit of dry excavation, after the section of the canal just south of the locks has been dredged by the hydraulic suction method.

The smoke stack, feed water pumps, and oil tanks now installed at the Agua Dulce pumping station are of sufficient capacity for the compressors and three extra boilers. Two compressors will be sufficient at Miraflores until the hydraulic excavation is completed. A third may be necessary when the drilling for dry excavation is begun, but by that time the excavation work in Culebra Cut north of Empire will be still further reduced, and the transfer of one or two of the remaining compressors at Las Cascadas and the necessary boilers will then be considered.

Springs for Approach Wall Fenders.

The award has been authorized to the Railway Steel Spring Company of a contract for furnishing helical springs for use in the fenders for the lock approach walls. Eight bids were received, and the lowest for 53 cents a spring, total of $13,572.24, was accepted. The total number of springs contracted for is 25,608 and their total weight, 640,200 pounds. Each spring must be 12¼ inches long when free, 9¼ inches when loaded, 3 1/16 inches inside diameter. The free height must not vary more than ⅛ of an inch from the height specified. An article descriptive of the fenders for which these springs are purchased was published in THE CANAL RECORD of October 11, 1911.

Family Quarters.

Applications for married quarters were on file on December 1, as follows:

LABOR FORCE AND QUARTERS IN NOVEMBER.

The total force at work on the Canal and Railroad on November 29, was 37,590, as compared with 37,260 at the end of October, 1911; with 35,641 in November, 1910, and 33,808 in November, 1909. Canal employes numbered 29,783 and railroad employes 7,807. The number of "gold" or white American employes in the Canal force, was 4,279, compared with 4,229 in October, 1911, and with 4,646 in November, 1910. The force report for November 29, follows:

QUARTERS.

On December 1, there were 25,132 occupants of Commission quarters. Of these, 9,267 were white Americans, of whom 5,244 were men, 2,077 were women, and 1,946 were children. There were 5,912 Europeans of the laborer class, of whom 5,249 were men, 277 women, and 386 children. There were 9,953 West Indian negroes, of whom 7,617 were men, 1,043 women, and 1,293 children. Included in the above were 149 Asiatics, and 113 Panamans.

STEAMSHOVEL RECORDS.

Work of Central Division and Relocated Shovels in November.

During the month of November the total amount of material excavated in the Central Division was 1,221,746 cubic yards, of which 126,487 cubic yards were classified as earth, and 1,095,259 cubic yards as rock.

Of this quantity 1,209,498 cubic yards were removed by steam shovels, contractors removed 2,960 cubic yards by sluicing and 9,288 cubic yards by hand.

The high record for the month was made by shovel No. 215, working 23½ days in the Empire District, which excavated 25,265 cubic yards of rock and 15,500 cubic yards of earth or a total of 40,765 cubic yards.

The second best record for the month was made by shovel No. 254, working 24 days in the Culebra District, which excavated 40,425 cubic yards of rock.

The best record for a shovel of the seventy-ton class was made by shovel No. 109, working 24 days in the Culebra District, which excavated 31,460 cubic yards of rock.

Shovel No. 211 working in the Empire District made a high record for one day by excavating 2,962 cubic yards o rock on Nóvember 6.

Except where noted, monthly reports are computed by place measurement, while the daily reports are based on car measurement. The best records for the month and for one day are shown below:

BEST RECORDS FOR THE MONTH.

SOCIAL LIFE OF THE ZONE.

Women's Clubs.

The general meeting of the Cristobal Woman's Club was held at the Commission clubhouse on Wednesday, December 6, the speaker being Miss Alice Alexander, supervisor of primary grades in the Canal Zone schools. She outlined ideal conditions for the primary school, gave practical examples of the workings of the child mind, emphasized the necessity of encouraging humor in the child, and the main point in the training of the child in and out of the school—to keep him happy. The board of managers has voted to place a sanitary drinking fountain in the city of Colon. The subcommittee of the philanthropy department reported that the last of the series of free health lectures in Colon had been given on October 31. It is estimated that 1,200 persons heard these lectures, the largest attendance being in October, when the lecture was given in French before an audience of more than 400. The use of the hall for the lectures is given free of rent, the slides used were furnished by the Department of Sanitation and the electric light for the lantern was installed by the Commission. The subcommittee is looking to the purchase of new slides, with the possible addition of moving pictures, and the increase of the scope of the work. A second course of six lectures will begin in January. The next meeting of the Cristobal club will be on December 13, when the home department will present a program of papers on home life in England. Mrs. J. L. Storla and Miss Daisy Farquason will be the speakers.

The Gatun Woman's Club will meet at the home of the president, Mrs. W. J. Allen, on Thursday afternoon, December 14. Plans will be made for an open meeting under the social committee in January.

The Paraiso Woman's Club is preparing for the Christmas celebration which will be held in the chapel on Christmas Eve. A fund has been raised in the village for the purpose. About 75 children will be given presents and will participate in the exercises of the evening. The playground equipment given by the club has been placed under the school building, the ground having been leveled and prepared for the purpose. The equipment consists of three swings, three sets of rings, three horizontal bars and one sand pit. Mrs. W. M. Coutermarsh has resigned as secretary and Mrs. W. M. McIntyre has been appointed in her place for the remainder of the term which expires in January.

Church Notes.

The monthly meeting of the Woman's Foreign Missionary Society of the Methodist Episcopal Church, Panama, was held at the home of Mrs. E.M. Keyser, Ancon, on Thursday, December 7. Mrs Harry Compton presided, and the lesson on Buddhism was conducted by Mrs. J. H. Stokoe; the attendance was large, there being a number of out of town visitors present. The next meeting will be held on January 18, when Mrs. E. L. Kent will entertain the society at the Commission chapel in Paraiso.

The Altar Guild of St. Mary's Protestant Episcopal Church, Empire, will hold a Christmas sale at the Commission clubhouse on Monday evening, December 18, from 6 to 10.

The Altar Society of St. Ferdinand's Roman Catholic Church, Empire, held a cake sale in the parish house on November 29, the proceeds of which were $20. The society will hold a similar sale on Saturday, December 23. The club in connection with St. Ferdinand's Church held a dance at Kangaroo Hall on December 9. The club holds a dance monthly.

On Sunday, December 3, the new building of the Church of St. Philip, Protestant Episcopal mission at Las Cascadas, was dedicated. The building is a remodelled frame structure, given to the mission to replace the old building which was required for use at Camp Otis. The Rev. W. H. Decker, priest in charge of the mission, was assisted by Chaplain Henry A. Brown, general missionary, and three other priests of the missions for West Indians. St. Philip's mission was founded eight years ago.

On Thursday afternoon, December 14, the children of the West Indian Progressive Society and the Wesleyan schools will be given an outing in the baseball park, Colon.

Union Church at Cristobal.

It has been decided to move a new laborers barracks from Camp Bierd to Cristobal there to be remodeled for use as a Commission church and lodge hall. This will take the place of the old church and lodge hall now occupied by the courts.

Obituary.

Oscar L. Des Londes, an employe of the Panama Railroad Telephone and Telegraph service, was killed by an electric shock while at work at Gatun on December 8. He was 34 years of age, married, and had been on the Isthmus two years, coming here from New York. He is survived by his wife who is living at Gatun.

Jinkney Jefferies, a member of the Tenth Infantry at Las Cascadas, died in Ancon Hospital on December 2, as the result of being struck on the head with a stone in an altercation between two other soldiers. He was twenty-one years of age, single, and had been on the Isthmus six weeks. He is survived by his mother, Mrs. Laurie Jefferies, living at Finley, Ky.

Missing Men.

Any one having information regarding the whereabouts of Joseph Delaney of Brooklyn, N. Y., a machinist who came to the Isthmus two years ago, is requested to communicate with the American Legation, Panama.

Any one having information regarding the whereabouts of J. B. Mcarthy who came to the Isthmus from Bolivia last July, is requested to communicate with Claude C. Pierce, Quarantine Officer, Cristobal.

Any one having information regarding the whereabouts of H. A. Press, who is supposed to be on the Isthmus, is requested to communicate with THE CANAL RECORD.

Baseball.

A match game of baseball was played at Colon on Sunday, December 10, by teams representing Mount Hope and the McClintic-Marshall Company. The score follows:

	1	2	3	4	5	6	7	R	H	E
Mt. Hope......	2	0	0	2	2	5	—	11	10	8
McC-M-Co.....	0	0	0	0	3	0	0	3	7	1

Team No. 1	13	5	14,122
Team No. 3	10	8	13,506
Team Bo. 4	8	10	13,291
Team No. 2	5	13	13,056

Each man on the winning team will receive a gold medal. The high team score for three games is 2,501, Team No. 1. The high team score for one game is 886, Team No. 1. The high individual score during the tournament is 224 by J. C. Cushing.

Cristobal won the basket ball game with Culebra on Saturday evening. The score was 15 to 10, with the following line-up:

Culebra.	Cristobal
Cushing	Sartor
Vanzandt	Luce
Hepler	Weller
Barcroft	Sterner
Stillwell	Schwallenberg
Kenney	Schlager

The Empire boys lost in bowling at Culebra, Saturday morning, after the bowling game the boys played a game of basket ball with the Culebra team and also lost.

EMPIRE.

The following high scores were bowled in duck pins during the week: Rodeighiro, 104, 118, 108, 115; Payne, 102; Dakin, 101; N. Giavolli, 111; Parkis, 104.

The Cristobal duck pin bowling team will bowl the Empire team on the latter's alleys on Saturday, December 16.

A handicap pool tournament has been arranged for the month of December. Prizes will be given for the first, second, and third places.

The annual Christmas entertainment for the children of Empire will be held in the clubhouse on Saturday night, December 23.

GORGONA.

The Gorgona Musical Club furnished a program for the sunset singing service at the Chapel in Las Cascadas for the soldiers of Camp Otis on Sunday, December 10. Solos were sung by Mrs. J. H. Murray, Mrs. Glen Pearson, Miss Beehler, and Mr. Thos. Gardner. E. A. Putnam of Cristobal delivered an address on the subject "Brain *vs* Brawn." Mrs. T. S. Booz accompanied all of the musical numbers on the piano. Fully 300 were present.

The singing at the sunset service on December 10 was led by Carl Moyer; M. L. Booz, piano; Ernest Reinhold, violin; Jess T. Hopkins, cornet.

A. J. Cameron tendered the basket ball team a turkey dinner at the hotel on Wednesday evening, December 6. Captain of the team, Jerry Carpenter, presided at the head of the table and Oscar O. Kuentz, manager assisted with the carving at the foot of the table. There were present Messrs. F. G. Swanson, T. S. Booz, Wm. Earl, Edgar Louden, A. M. Johnson, S. B. Stevens, A. J. Cameron, and Jess T. Hopkins.

GATUN.

The names of C. A. Strom and Maj. J. P. Jervey have been added to Class No. 1 in Spanish.

Miss Harris served as accompanist at the moving picture entertainment on Thursday evening.

"Political Presidential Possibilities" were discussed by the Drop-in-Discussion Club on Sunday evening, December 10. Among those taking a prominent part were Messrs. St. Clair, Formon, Hanson, Dillon, Mussina and Smith.

A sacred concert was given by the MacWatters Quartet on Sunday afternoon, December 10. J. Adams Oakes delivered a brief address.

The Gorgona Minstrel Troupe will play at Gatun on December 19.

Seven new library books were purchased during the past week as well as several new records for the phonograph.

Empire played basket ball at Gatun on Saturday evening, December 9. Gatun won by a score of 51 to 18. A social hour with refreshments followed the game.

CRISTOBAL.

A contest in progressive chess was held on Tuesday evening December 5 in the chess club room. Messrs. Payton, Millman, Morrison, Davidson, Farrugia, Cleall, Randolf, Merrill, Harfeld, and Chambers played. Fifteen games were played. Mr. Davidson carried off the honors of the evening, winning three games and losing none.

A public debate was held on Wednesday evening December 6 upon the subject "Resolved that the Nations of the World should Disarm in the Interest of Peace." Threee speakers on each side, namely, affirmative, Messrs. Elliott, Storla, and O'Neal; negative, Messrs. Morrison, Dinnin, and Wempe. Decision was rendered in favor of the affirmative. Musical numbers were rendered by Miss Dorothy Layland. After the program refreshments were served. One hundred and thirty-one people attended.

On Friday, December 15, the Gorgona Minstrels will give an entertainment. Admission, members free, others 50 cents.

Two of the local departmental duck pin teams defeated the picked teams from Empire and Gatun last Saturday night with scores as follows:

Empire.		*Quartermaster's Dept.*	
Pinney	305	Barrett	268
Leon	268	Hess	264
Lippert	170	Jacques	79
Swallow	83	Herring	176
Dakin	69	Smith	259
Davis	183	Louch	303
Rodeghireo	272		
Total	1,350	Total	1,349
Gatun.		*Dry Dock and Comsy.*	
Green	270	Collins	277
Dickson	158	Wheeler	280
Teall	73	Gibson	296
Worcester	272	Herrington	263
DePoorter	285	Weston	271
Barte	258		
Total	1,316	Total	1,387

On December 9, the following teams were leading in the Ragtime Tournaments: Ten Pins, Collins and Louch, 1,098; duck pins, Barrett and Louch, 505; candle pins, Barrett and Bullard, 534.

Ten Pins—Rabbitt, 200, 214; Collins, 209, 209; Gibson, 210; Russell, 203; Bullard, 200. Candle pins—Barrett, 101, Louch, 110; Blackburn, 100.

The topic for discussion by the Debating Club on Wednesday evening, December 20, will be "Resolved that the Canal Zone should be a military reservation."

LOST—Six year pin, between Dock 1 and Cristobal Corral on Bolivar Street—marked on back "James A. Avery, April 7, 1905." Finder will be rewarded for return to Mount Hope Depôt.

OFFICIAL CIRCULARS.

Acting Chief Clerk.

GORGONA, C. Z., December 7, 1911.

TO ALL CONCERNED:

Effective December 8 and during absence on leave of Chief Clerk and Assistant, Mr. F. G. Swanson, is designated Acting Chief Clerk of the Mechanical Division.

A. L. ROBINSON,
Superintendent, Mechanical Division.

Inspection of P. R. R. Vessels.

CULEBRA, C. Z., December 7, 1911.

CIRCULAR No. 239-B.

Inasmuch as Executive Order of July 21, 1911, providing for the inspection of steam vessels navigating the waters of the Canal Zone, requires the Board of Local Inspectors of the Canal Zone to make the inspection therein enjoined, which covers boilers as well as hulls of vessels, in the case of Panama Railroad Company's floating equipment the provisions of Circular No. 239-A (Boiler Inspection Rules and Regulations), so far as the same require the Boiler Inspection Service of the Mechanical Division to inspect boilers of Panama Railroad Company's floating equipment, are hereby revoked.

GEO. W. GOETHALS,
Chairman Isthmian Canal Commission.
President Panama Railroad Company.

Sale of Scrap.

CULEBRA, C. Z., December 9, 1911.

TO ALL CONCERNED.

The Commission has entered into contract whereby the following prices are received for items mentioned:

Material.	Unit Price Per 100 Lbs	Price Per Ton
Scrap copper screens	$8.25	$165 00
Scrap manila rope	2.18	43 00
Scrap rubber	2.10	42.00
Scrap hose	2.50	50 00

Great care should be exercised to see that all of this class of material that becomes unserviceable is turned into the nearest Quartermaster's Storekeeper as scrap.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Auction of Unclaimed Shipments.

PANAMA RAILROAD COMPANY,
OFFICE OF GENERAL SUPERINTENDENT,
COLON, R. P., December 8, 1911.

In order to recover freight and storage charges, the Panama Railroad will dispose of the accumulation of Over and Unclaimed Shipments now in its possession, by public auction, commencing Wednesday, January 10, 1912, at 9.30 a. m.; sale to be held on Dock No. 11, Cristobal, C. Z.

The items to be sold consist of a miscellaneous assortment of wines, liquors, household goods, building material, stationery, groceries, dry goods, machinery, and merchandise in general, all of which has been held six months and over in an effort to locate owner.

J. A. SMITH, *General Superintendent.*

Sale at Public Auction.

There will be sold at Public Auction, by the District Quartermaster, at the old corral, Ancon, 2 p. m., Saturday, December 23, 1911, to the highest bidder, for cash, the following Isthmian Canal Commission property: Ten (10) mules, (American) and one (1) pony, (native). The Government reserves the right to accept or reject any or all bids. For further information apply to District Quartermaster, Ancon, Canal Zone. C. A. DEVOL, *Chief Quartermaster.*

Stages of the Chagres.

Maximum heights of the Chagres River for the week ending midnight, Saturday, December 9, 1911. All heights are in feet above mean sea level.

Married.

STEVENS-KELLY—At the Y. M. C. A., Cristobal, on December 7, Clara Marion Kelly of New York, to Geo. H. Stevens of Lee, Mass., the Rev. J. L. Wise officiating. Canal Zone residence, Paraiso.

FOUND—A pearl brooch in Panama. The owner can have it by calling at Piza's store in Panama and identifying her property.

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning December 11, 1911.

FRESH MEATS.	*Price.*
Mutton—Stewing, per pound	6
Shoulder, neck trimmed off, (4 pounds and over), per pound	9
Entire forequarter (not trimmed), 10 pounds and over, per pound	8
Leg (8 to 10 pounds), per pound	17
Cutlets, per pound	18
Short cut chops, per pound	20
Lamb—Stewing, per pound	6
Entire forequarter, neck trimmed off, per pound	9
Leg (5 to 8 pounds), per pound	20
Chops, per pound	24
Cutlets, per pound	24
Veal—Stewing, per pound	10
Shoulder, for roasting (not under 4 pounds), per pound	12½
Chops, shoulder, per pound	16
Chops, per pound	24
Loin, for roasting, per pound	24
Cutlets, per pound	28
Pork—Loin chops or roast, per pound	*16
Beef—Suet, per pound	2
Soup, per pound	5
Stew, per pound	8
Corned, No. 1, per pound	12
Corned, No. 2, per pound	10
Chuck roast (3 pounds and over), per pound	12
Pot roast, per pound	12½
Rib roast, second cut (not under 3½ pounds), per pound	16
Rib roast, first cut (not under 3 pounds), per pound	18
Sirloin roast, per pound	19
Rump roast, per pound	19
Porterhouse roast, per pound	20
Steak, chuck, per pound	12½
Round, per pound	13
Rib, per pound	18
Sirloin, per pound	19
Rump, per pound	19
Porterhouse (not less than 1½ pounds), per pound	20
Tenderloin (Western), per pound	24

MISCELLANEOUS.	
Caviare, Russian, per tin	47, 89
Livers—Beef, per pound	7
Calf, each	60
Half, each	30
Steak, Hamburger, pkg	13
Sausage—Bologna, per pound	10
Frankfurter, per pound	12
Lieberwurst, per pound	10
Devonshire Farm, per pound	17
Sweetbread—Veal, per pound	1 20
Beef, per pound	25
Eggs, fresh, dozen	39
one-half dozen only	20
Bluefish, fresh, per pound	14
Halibut, fresh, per pound	15
Oysters, 1 qt. kegs, per keg	50

POULTRY AND GAME.	
Chickens—Fancy roasting, milk fed, large, each	1.35
Fancy roasting, milk fed, med., each	1.00
Fancy roasting, corn fed, about 4½ pounds, each	90
Fowls, each 60, 70, 80, 90	1.00
Ducks, Western, about 4½ pounds, each	1.00
Broilers, milk fed, each	70
corn fed, each	60
Turkeys, per pound	28
Squabs, each	35
Capons, each	2.10
Grouse, each	50

CURED AND PICKLED MEATS.	
Ham—German, Westphalia, per pound	36
Sugar cured, per pound	20
Sliced, per pound	22
Half, for boiling, per pound	21
Boiled, per pound	28
Hocks, per pound	‡18
Todd's Smithfield Virginia, per pound	30
Bacon—Breakfast, whole piece, per pound	23
Breakfast, sliced, per pound	24
Pork, salt family, per pound	13
Ox tongues, each	1.00
Pigs' feet, per pound	9
Tongues, per pound	18
Sliced bacon in 1-pound tins, per tin	30
In 1-pound jars, per jar	30

DAIRY PRODUCTS.	
Butter—Creamery special, per pound	39
Cheese—Roquefort, per pound	45
Philadelphia cream, cake	10
Young America, per pound	20
Swiss, per pound	26
Edam, each	1.00
Neufchatel, cake	6
Gouda, per pound	34
Milk (Certified), per bottle	**25
Buttermilk, bottle	**15
Fer-mil-lac, bottle	**25

	Price.
Ice cream, quart	‡25
½-gallon	‡50

VEGETABLES AND FRUITS.	
Beets, per pound	3
Celery, per head	6
Cabbage, per pound	4
Cucumbers, per pound	12
Carrots, per pound	3
Lettuce, per pound	12
Onions, per pound	3½
Potatoes, white, per pound	3½
sweet, per pound	2
Parsnips, per pound	4
Parsley, per pound	10
Squash, per pound	3
Turnips, per pound	3
Yams, per pound	3
Apples, per pound	5
Cranberries, per pound	9
Grapes, per pound	10
Grapefruit, each	4
Lemons, dozen	24
Limes, per 100	80
Oranges, per dozen	12
Pears, per pound	10

Supplies for Canal Work.

The following steamers with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon, and Balboa, during the week ending December 9:

Oruba, December 3, from New York, with 36 cases tee calks, 8 cases clocks, for stock.

Kiora, December 4, from Baltimore, with 20,500 cases dynamite, 1,060 kegs nails, 1,384 bundles corrugated iron, 500 kegs bolts, 2,000 kegs spikes, 9,000 bundles tie plates, 1,334 pieces sewer pipe, for stock; 868 pieces steel ties, for Atlantic Division; 2,329 pieces steel ties, for Pacific Division; 2,584 pieces sewer pipe, for Atlantic Division; 284 packages couplers, 200 car wheels, for Mechanical Division.

Hermiston, December 4, from New York, with 132,338 bags cement, for Atlantic and Pacific Divisions.

Karen, December 5, from New Orleans, with 8,881 pieces creosoted ties, for Panama Railroad Company; 78 pieces piling, for stock.

Mackinaw, December 6, fron San Francisco, with 403 bales alfalfa hay, for stock.

Atenas, December 7, from New Orleans, with 79 bundles castings, 119 sacks brackets, for Atlantic Division; 12 cases incandescent lamps, for Mechanical Division; 1,580 pieces creosoted ties, for Panama Railroad Company; 185 bales rice straw, 125 barrels fire clay, 250 bundles switch stands, 50 cases library paste, 411 pieces car stakes, 13 cases hardware, 77 pieces piling, 6,697 pieces yellow pine lumber, for stock.

Metapan, December 7, from New York, with 51 kegs boat spikes, 39 coils rope, 25 coils tarred marline, 15 bundles hardware, for stock.

Colon, December 7, from New York, with 200 bundles brake shoes, 10 cases lamp shades, for Mechanical Division; 47 cases books, 7 cylinders acetylene gas, for Chief Engineer; 4,000 pieces tiling, for Panama Railroad Company; 728 bundles bolts, 19 cases bolts, for Atlantic Division; 204 bales oakum, 2,141 pieces steel ties, for Pacific Division; 48,960 pieces conduit tile, for Atlantic Division; 20 cases lanterns, 7 barrels washers, 121 barrels coal tar, 456 bundles shovels, 15 casks chains, 86 crates sledge handles, 14 bales cotton mops, 17 bales cork life preservers, 15 cases stationery, 300 barrels screw spikes, 15 cases tacks, 50bundles steel bars, 30 barrels sea coal facing, 60 crates stoves, 49 cases pipe fittings, for stock; and a miscellaneous cargo, the whole consisting of 57,693 packages, weighing 815 tons.

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending December 20, 1911. (75th meridian time):

DATE.	High	Low	High	Low	High
	A.M.	A.M.	A.M.	P.M.	P.M.
December 14	......	4.20	10.32	4.48	11.05
December 15	......	5.30	11.58	5.52	......
			P.M.		
December 16	12.10	6.32	12.57	6.57	......
December 17	1.10	7.30	1.57	7.53	......
December 18	2.02	8.20	2.47	8.42	......
December 19	2.48	9.03	3.30	9.27	......
December 20	3.30	9.45	4.08	10.08	......

LOST—A reward is offered to anyone who will give any information regarding Canal Medal which belonged to Jas. Humphreys, Master of Dredge No. 85, at Gatun, and which was lost on board the dredge on or about December 1.

MOVEMENT OF OCEAN VESSELS.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Eitel Friedrich* call at Santiago de Cuba, on both outward and homeward voyages.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct leave on Thursdays at 3 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

The Leyland Line steamer *William Cliff* will sail from Colon for Port Limon and New Orleans, on December 22.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, DECEMBER 20, 1911. No. 17.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents each.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Chairman's Report.

The report of the Chairman of the Isthmian Canal Commission for the month of November is published in full in other columns of this issue of THE CANAL RECORD. It gives a detailed account of the progress of the Canal Work in all departments and divisions.

Gatun Spillway Dam.

Sheet piling and accessory materials are being collected at the Spillway of Gatun Dam for coffering off parts of the channel while the base of the Spillway dam is being built.

In laying the floor above and below the dam no concrete was placed under the downstream toe and a space 40 feet wide and reaching elevation —2 extends across the present channel of flow. Silt and debris will have to be cleaned from this space before the concrete forming the downstream toe of the dam can be placed.

In the first stage of the operations, stop plank will be placed to rest against the upstream side of the piers for a little over half way across the channel, beginning at the east side; a sheet pile cofferdam will be driven across the 40-foot space and a cofferdam filled with clay and resting on the concrete floor below the dam will complete the closure. The space enclosed will be pumped out and cleaned and the laying of concrete will follow.

The piling will be driven with a steam hammer with leads suspended from the boom of a stiff-legged derrick, resting on one of the piers. Derricks will also be used in placing concrete which will be supplied in two-cubic-yard buckets from the mixing plant 4,000 feet away.

Cristobal Terminal Docks.

The breakwater at the Cristobal Terminal Docks has been extended 1,800 feet from the shore line. This trestle has been filled and a double track laid for a distance of 800 feet. At a point 1,100 feet from the shore line, the mole crosses a very soft bottom which has given considerable trouble in the construction of the breakwater. There have been three or four settlements at this point, and in the small norther which occurred the first week in December a section 150 feet long was taken out. This section was practically filled, the track being supported on ground, but the action of the waves spread out this material until it now lies three or four feet below the surface of the water.

A pile driver was started on replacing this gap, which was closed on December 11. It is anticipated that there will be further trouble at this point before the solid material finally reaches bottom.

The second shipment of steel plate for caisson construction was lost at sea with the Munson Line steamship *Moldegaard*, which went ashore at Cat Island. The progress of the work may be retarded slightly due to this loss, although the Chief Quartermaster is endeavoring to have a replace shipment made at the earliest possible date. The sinking of caissons is now under way on Dock 16 and Pier 17, and on Saturday night, December 9, there had been driven 2,131 linear feet of 4 foot cylinders on Dock 16, and 840 linear feet of 6-foot cylinders on Pier 17.

Drainage of Dredge Discharge into Manzanilla Bay

The suction dredges excavating in the Canal prism between Gatun Locks and Mindi discharge behind a dike on the east side of the Panama railroad at Mindi, whence the water flows off into the Mindi River and thence to the French canal. The silt carried by the water is rapidly filling the river and the canal to such an extent that navigation in the latter, even for light draft vessels, will soon be impossible. It is convenient to keep the old canal open for the towing of barges of cement from Cristobal to Gatun, and also for the passage of launches. Approval has therefore been given for a project to keep the discharge from the dredges out of the old canal, and divert it into Manzanilla Bay through the old East Diversion channel. The diversion ditch formerly ran from Gatun to the bay, into which it emptied at the mouth of the Escondido River.

The project for utilizing this ditch involves the excavation of the dam thrown across it some years ago to store an auxiliary supply of water for Cristobal and Colon, the construction of a trestle across the channel to take the railroad track to Mindi magazine, a bridge over the channel to take the Gatun-Colon highway, and the excavation of 20,000 cubic yards of soft material by clamshell bucket on a derrick barge.

Cranes for Lock Machinery.

Award has been authorized to the Industrial Works of Bay City, Mich., of a contract for four locomotive cranes which will be used in the erection of machinery in the locks. The total price for the cranes with auxiliary hooks and lines is $31,500. No award was made for the stiff-leg derricks, for which bids were requested in the same circular with the cranes.

The cranes required are 15-ton class, capable of handling 8,000 pounds at a 40-foot radius when the outriggers are not in use, and 30,000 pounds at 15-foot radius. An article indicating the scope of the work of erecting the lock machinery was published in THE CANAL RECORD of September 1.

Scrap Contractors at Work.

One of the sights of the Canal Zone is the discarded locomotives, cars, dredges, barges, boilers and miscellaneous junk which border the route of the Canal, flotsam from the wreck of the French efforts. A considerable part of this abandoned machinery has been renovated and put in use by the Americans. Up to January 1, 1911, 58,620,309 pounds of it had been shipped as scrap to buyers in the States; the value of this and of the machinery put in use by the Americans aggregates $2,112,063.00.

On September 5, 1911, bids were opened in Washington for the purchase of all the French scrap remaining on the Isthmus and not taken up on the property papers of the Commission and credited to the French scrap account. It was stipulated that three years should be allowed in which to remove all the material and that the Panama railroad should charge a flat rate of $2.25 a ton for hauling to seaports, loading to be done by the contractor. The successful bidder was the Chicago Housewrecking Company, which offered $215,000.

This firm has begun the work of removal and is employing on the Isthmus about fifty laborers under the direction of four white Americans. The work at present is preliminary, consisting of cleaning up the yard back of Dock 14 at Cristobal and in clearing the way to outlying collections of scrap along the line of the Panama railroad. Some of it is at considerable distance from the main line of the railroad, but in no case is it thought that the cost of removal will exceed the value.

A large amount of scrap has been dumped in the yard at Dock 14, where workmen are engaged in breaking it up and sorting it in piles, close to the wharf, according to the grade of metal. Dealers in scrap recognize about three hundred classifications of iron and steel. The representative of the Chicago Housewrecking Company says that practically every grade is to be found in the scrap which his men are sorting.

Within a short time the firm will have in use at Dock 14 two 20-ton locomotive cranes, one with a 50-foot boom, equipped with electric magnets capable of lifting 3 tons. It will have in addition a pair of power shears, capable of cutting through a bar of steel 6 inches square in cross-section. A great part of the metal will be cut into lengths of three feet, for convenience in melting. At present the machinery is broken to pieces by cutting the rivets with sledge and "cold-cut." Broken

NOTES OF PROGRESS.

(*Continued.*)

up and piled, the material will occupy about one twenty-fifth of the space taken up by the original machinery. It will be shipped direct to the foundries which buy it from the contractor.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 73 per cent completed, 165,273 cubic yards, out of a total of 225,000, having been placed at the close of work on December 16. A statement of the amount laid each working day last week, and of the total in place, follows:

Date.	Concrete Laid.	Hours worked.	No. Mixers.
December 11	118	7.00	2
December 12	176	7.30	2
December 13	212	12.30	2
December 14	216	8.45	2
December 15	168	8.00	2
December 16	198	12.00	2
Total	1088	55.45	2
Previously reported	164,185		
Grand total	165,273		

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending December 16, follows:

Date.	Hours worked.	Cubic Yards.
December 11	3.50	1,910
December 12	3.03	1,557
December 13	3.09	1,539
December 14	3.24	1,562
December 15	4.34	1,865
December 16	4.53	2,220
Total	22.53	10,653

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending December 16, follows:

Date.	Hours worked.	Cubic Yards.
December 11	7.10	2,386
December 12	7.20	2,926
December 13	6.40	2,600
December 14	5.50	2,315
December 15	6.25	2,296
December 16	7.15	2,712
Total	40.40	15,235

Visit of Committee on Interstate and Foreign Commerce.

The following members of the House of Representatives Committee on Interstate and Foreign Commerce arrived on the *Cristobal* on December 18: Representatives W. C. Adamson of Georgia, chairman of the committee, A. J. Sabath of Illinois, T. W. Sims of Tennessee, C. W. Hamlin of Missouri, F. E Doremus of Michigan, J. H. Covington of Maryland, F. C. Stevens of Minnesota, E. L. Hamilton of Michigan, M. E. Driscoll of New York, J. J. Esch of Wisconsin, and Mr. W. J. Davis, clerk of the committee. Due to arrive on the *Panama* on December 20 are J. R. Knowland of California, John A. Martin of Colorado, S. W. Gould of Maine. The committee began its hearings at the Hotel Tivoli on the night of December 19.

Accompanying the members of the committee on the *Cristobal* were Representatives H. T. Rainey of Illinois and Mrs. Rainey, W. P. Borland of Missouri and Mrs. Borland, T. W. Hardwick of Georgia and Mrs. Hardwick, S. J. Tribble of Georgia and Mrs. Tribble, J. H. Stephens of Texas and Mrs. Stephens, J. C. McLoughlin of Michigan, and C. B. Miller of Minnestoa, and Mrs. Sabath, Mrs. Sims, Mrs. Hamlin, Mrs. Covington, Mrs. Doremus, Mrs. Stephens, Mrs. Hamilton, Mrs. Driscoll, Miss Rose, Miss Tribble, Miss Esch, Mr. and Mrs. Ralph Smith, Messrs. R. J. Spier, Charles F. Riddell, S. P. Gilbert, John Corrigan, H. Lutzenkircher, W. B. Fullerton.

In addition the members on the committee due to arrive on the *Panama* are Representatives W. D. Stephens of California, C. C. Bowman of Pennsylvania, and Mrs. Gould, Mrs. Knowland, Mrs. Martin and niece.

CONCRETE WORK IN THE LOCKS.

Over 74 per cent of the concrete for the locks is in place, the amount at the close of work on December 16, being 3,102,941 cubic yards, out of a total of approximately 4,199,400. A total of 25,574.5 cubic yards of concrete was laid in the locks during the week ending December 16.

GATUN LOCKS.

Over 87 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on December 16 being 1,746,964 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending December 16, and of the total, follows; and a similar statement for the work in the spillway of Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers.			Large stone.	Total.
	Concrete placed.	Hours worked.	No. of mixers	Concrete placed.	Hours worked.	No. of mixers		
	Cu. Yds.			*Cu. Yds.*			*Cu. Yds.*	*Cu. Yds.*
December 11	1,808	30.52	6	508	6.00	2	6	2,406
December 12	1,538	24.00	6	512	6.40	2	....	2,079½
December 13	1,250	20.18	4	496	6.40	2	....	1,815
December 14	1,070	18.28	6	380	5.40	2	....	1,483
December 15	1,144	19.18	6	420	5.40	2	18	1,644½
December 16	1,328	22.10	8	350	4.40	2	2	1,738½
*Portable mixers	....	....	......	336.5	....	......	....	
Total	8,138	135.6	6	3,002.5	35.20	2	26	11,166½
Previously reported	....	....	......	....	....	......	....	1,735,797½
Grand total	....	....	......	....	....	......	....	1,746,964

The 336½ yards shown for the portable mixers are reinforced concrete, and were placed on the following days; December 11th, 84; December 12th, 29½; December 13th, 69; December 14th, 33; December 15th, 62½; December 16th, 58½.

PEDRO MIGUEL LOCK.

Concrete work in the locks at Pedro Miguel is over 93 per cent completed, 784,362 cubic yards, out of a total of 837,400, bucket measurement, having been placed at the close of work on December 16. The record for each of the six 8-hour working days of last week, follows:

Date.	Auxiliary Plant. 2-cubic yard mixers.			Auxiliary Plant. ½-cubic yard mixer.			Large stone.	Total.
	Concrete placed.	Hours worked.	No. of mixers	Concrete placed.	Hours worked.	No. of mixers

BASEBALL.

Officers and Schedule of The Panama Canal League.

The Panama Canal Baseball League has organized for the season of 1912 with the following officers: President, S. B. Williamson; vice-president, John Burke; secretary and treasurer, M. F. Hathaway; Executive Committee, Dr. J. C. Perry, chairman, E. J. Williams, J. W. Coffin.

Four teams have been organized and each will play 30 games according to the following schedule:

DATE.	ANCON.	EMPIRE.	COLON.
December 31, 1911	Ancon–Empire		Com. Sub.–Tenth Inf
January 1, 1912		Empire–Tenth Inf	Com. Sub.–Ancon

June 2		Empire–Tenth Inf	Com. Sub.–Ancon
June 9	Ancon–Tenth Inf	Empire–Com. Sub	
June 16	Ancon–Tenth Inf		Com. Sub.–Empire
June 23		Empire–Ancon	Com. Sub.–Tenth Inf
June 30	Ancon–Com. Sub	Empire–Tenth Inf	

Admission will be as heretofore, 25 cents for bleachers, 50 cents for grand stand, 75 cents for box seats.

CHRISTMAS SOCIAL EVENTS.

Religious and Secular Entertainment.

In practically every one of the Canal Zone villages Christmas will be celebrated socially. The following list is of the more noteworthy entertainments:

Union Churches—The Cristobal church will hold Christmas services as follows: On December 24, at 10 a. m., the Sunday school will celebrate with a Christmas program; at 7.45 p. m., there will be preaching services in the Commission clubhouse with a sermon on "The Meaning of Christmas" by the pastor, the Rev. Carl H. Elliott.

At Gatun the Sunday school will celebrate on December 24, in the chapel. There will be a tree, and suitable music will be sung, including a Christmas cantata.

The Christmas services will be held in the chapel on December 24. The subject of the morning sermon will be "The Significance of Christmas" and in the evening the subject will be "The Significance of Jesus." There will be special music at each service. The preacher for the day will be the Rev Mr. Purdy, chaplain to the Christian League.

At Culebra the Sunday school will celebrate on December 24, at 9.30 a. m. There will be a program in which the children will take part. The preaching service will be held on the evening of the same day. The Rev. A. A. Nellis will be the preacher.

The Sunday school at Las Cascadas will hold its Christmas celebration on Christmas Eve in the chapel. There will be a program in which the pupils of the school will take part, and a Christmas cantata will be sung.

The Song and Praise Association and Union Sunday School of Pedro Miguel will hold a Christmas entertainment on the evening of Saturday, December 23. A Christmas operetta will be sung by the children of the Sunday school.

The Corozal Sunday school will hold a Christmas celebration in the Commission clubhouse on Saturday evening, December 23, at 7.30 p. m. All residents of Corozal and Camp Diablo are invited to attend.

Methodist Episcopal Church—Bishop Frank M. Bristol will be the preacher at the Christmas service in the Methodist Church, Panama. The morning service will be at 10 o'clock and the evening service at 7, as usual. On Saturday evening, the three Sunday schools of the church, Old Balboa, East Balboa, and the school of the sea wall church, will unite in their Christmas celebration. A program of special music has been prepared, and there will be a tree and gifts for the children.

Protestant Episcopal—The Christmas service at St. Luke's Hospital chapel, Ancon, will be held on Sunday, December 24, at 10 a. m. There will be special music by the men's choir. On Christmas Day there will be a celebration of the Holy Communion at 9 a. m. The children's Christmas service will be held in the chapel on December 28 at 5.00 p. m.

At Christ Church By-The-Sea, Colon, there will be the usual services on Sunday, December 24, and a celebration of the Holy Communion at 12 midnight on Christmas eve. On Christmas Day there will be a celebration of the Holy Communion at 7.30 a. m., and a choral service at 10.30 a. m., a vesper service for children at 4 p. m., and solemn evensong at 7.30.

Protestant Episcopal (West Indian)—On December 24, there will be a service at Bas Obispo at 8 a. m., and on Christmas Day there will be a celebration of the Holy Communion at St. Andrews, Church, Empire, at 6 a. m., and a second service at 11 a. m.

Roman Catholic—At St. Ferdinand's, Empire, the Catholic Club of American men will make its corporate communion at the first mass on Christmas Eve, at 7.30 a. m.; there will be the usual mass at 9 a. m., the children's celebration, with tree and distribution of gifts in the parish house at 3 p. m., and solemn vespers at 7.30 p. m. On Christmas Day masses will be said at 7 and at 9 a. m. At Gorgona there will be mass at 7.30 a. m., and at Las Cascadas mass at 8.30 on Christmas Day.

There will be three masses said at the Roman Catholic chapel in Ancon Hospital Grounds, Sacred Heart, on Christmas Day, the first at 6 a. m., the second at about 7.30 a. m., and the last at 9 o'clock. There will be the usual services on Sunday, December 24.

The Christmas entertainment at Paraiso, under the auspices of the Paraiso Woman's Club will be in the chapel on Christmas Eve. The pupils of the Sunday School will assist with songs and recitations.

The Balboa Volunteer Fire Department will give a Chrsitmas dance in the old Balboa hotel, Saturday evening, December 23.

The community Christmas entertainment at Cristobal-Colon will be held in the clubhouse on Saturday evening, December 23. There will be a short program and a treat for the children. A special entertainment for the bachelors will follow at 9 o'clock. Residents are urged to bring gifts of toys, books, fruits or other articles for the children of Colon. These will be distributed in the city on Christmas Day by the Colon Humane Society.

The committee which is preparing a Christmas celebration for the inmates of the Canal Zone penitentiary earnestly solicits gifts for the Christmas dinner. Cakes, fruits, nuts, tobacco or donations of money will be forwarded through the District Quartermaster in any of the villages without cost to the donor. The committee is asking for donations of cakes from Ancon, Culebra, and Empire. The cakes should be forwarded through the District Quartermaster on Christmas Eve.

Obituary.

Edward Fredrick Treadwell, an employe of the Pacific Division, was killed on December 15, at the Pedro Miguel Locks by a falling stone. He was 24 years of age, born in Martha's Vineyard, Mass., single, and had been on the Isthmus about seven months. He is survived by his mother, Mrs. Elmer Treadwell, living at Los Angeles, California.

International Brotherhood of Electrical Workers.

The International Brotherhood of Electrical Workers, Local Union No. 677, will hold its regular meeting and election of officers on Wednesday, December 27, at Gatun lodge hall at 8 p. m. All members are requested to attend.

Contract For Clearing Trails.

Bids will be received by the Purchasing Agent on the Isthmus, Isthmian Canal Commission, Mount Hope, Canal Zone, until 2:30 P.M., Saturday, December 23, 1911, at which time they will be opened in public, for the clearing of the following trails: Panama-Cruces, Corozal-Cruces, Pedro Miguel-Cruces, Empire-Cruces, Empire-Maria Eugenia, Arraijan-Rio Grande, Arraijan-Paraiso, and Arraijan-Cochinito. Work shall be done in accordance with specifications to be obtained upon application to the Superintendent of Public Works, Isthmian Canal Commission, Administration Building, Panama. Proposals may be made for clearing each trail separately, or for groups, or for the total. Successful bidders will be required to furnish a bond or make cash deposit in the sum of ten per cent of the amount bid as a guarantee that the work will be carried out. Proposals should be enclosed in a sealed envelope, marked "Proposal for Clearing Canal Zone Trails," and addressed to the undersigned. The Commission reserves the right to reject any or all bids, accept any bid or combination of bids, as may be deemed to its interest, and to waive defects and informalities in proposals.

C. NIXON,
Purchasing Agent on the Isthmus.

CANAL WORK IN NOVEMBER.

Monthly Report of the Chairman and Chief Engineer to the Secretary of War.

CULEBRA, C. Z., December 15, 1911.

The Honorable the Secretary of War,
Washington, D. C.

SIR: I have the honor to submit the following report of operations on the Isthmus for the month of November, 1911.

Department of Construction and Engineering.

The following table summarizes the principal items of construction work accomplished by the Atlantic, Central, and Pacific Divisions during the month:

ITEM.	Unit.	Atlantic.	Central.	Pacific.	Total.
Work excavation, dry	Cubic yards	54,719	1,218,786	117,034	1,390,539
Work excavation, wet	Cubic yards	742,242	2,960	462,283	1,207,485
Total work excavation	Cubic yards	796,961	1,221,746	579,317	2,598,024
Plant excavation, dry	....	....	....	....	....
Plant excavation, wet	Cubic yards	....	....	1,893	1,898
Total Canal Excavation	Cubic yards	796,961	1,221,746	581,215	2,599,922
Material placed in dams	Cubic yards	473,760	....	49,760	523,520
Concrete placed in locks and dams	Cubic yards	46,324		61,348	107,672
Explosives used	Tons (Gross)	40.90	187.99	35.25	261.14
Rock drilled	Feet	50,662	379,167	84,966	532,795
Tracks removed	Miles	....	11.40	....	11.40
New tracks laid	Miles	2.00	24.41	4.15	30.56
Rock crushed	Cubic yards	43,193	....	60,430	103,623
Cement used	Barrels	54,096	52	63,657	117,805
New roads built	Miles	0.26	....	....	0.26
Water mains laid	Feet	859	580	1,497	2,936
Sewers laid	Feet	299	256	2,015	2,570
Open drains and ditches dug	Feet	59,643	42,983	9,150	111,776
Average daily force	....	7,280	8,547	5,367	21,914
Average rainfall	Inches	15.80	12.30	6.52	11.92

First Division, Office of the Chief Engineer.

MASONRY AND LOCK STRUCTURES.

The material under contract for work designed in this subdivision is being inspected by the force of the General Purchasing Officer in the United States, and the erection work on the Isthmus is being conducted by the Division Engineers, the inspection being cared for by this subdivision. The field work consisted in preparing the valve chambers for the installation of the valves, which work is being done under supervision of this office. This subdivision is also charged with general inspection of the masonry work of all the locks.

LOCK GATES AND PROTECTIVE DEVICES.

Shop work in the United States—Up to November 20, a total of 39,812 tons of structural steel had been accepted at the rolling mills, or about 80 per cent of the total, of which 4,128 tons were rolled between October 20 and November 20, and a total of 23,311 tons of riveted structural material was shipped from Rankin shops, or about 46 per cent of the total contract weight. Of this last item, 3,037 tons were shipped between October 20 and November 20. In addition to this, a considerable tonnage of castings has been shipped; also about 20 per cent of the pipes for the pumping system, as well as the hand-railings for leaves Nos. 29 to 40 inclusive, 50 to 58 inclusive, and 52 to 65 inclusive.

Gatun Locks—The upper guard gates, 4 leaves, 54 feet 8 inches high, have been completed and practically all shipped. The upper gates and middle gates, upper lock, 8 leaves, 77 feet high, have been completed and practically all material for same has been shipped. The safety gates and lower gates, upper lock, 8 leaves, 77 feet high, have been practically completed and 95 per cent of same have been shipped. The middle and lower gates, middle lock, 8 leaves, 77 feet 10 inches high, have been 20 per cent completed at the shops, and 16 per cent of same has been shipped.

Pedro Miguel Lock—The upper guard gates, 4 leaves, 54 feet 8 inches high, have been completed and shipped. The upper and middle gates, 8 leaves, 79 feet high, have been practically completed and shipped. The safety and lower gates, 8 leaves, 79 feet high, have been 82 per cent completed and about 80 per cent shipped. Of the lower guard gates, 4 leaves, 47 feet 4 inches high, about 8 per cent has been completed and a small amount shipped.

Miraflores Locks—Practically none of this material has been manufactured or shipped.

LOCK GATE ERECTION.

Gatun—Upper guard gates, 54 feet 8 inches high, leaves 37, 38, 39, and 40. These leaves were practically erected and interior riveting was completed on October 1. The work on these leaves during the month of November consisted mainly of bolting up, reaming and riveting the sheathing. No reaction castings were attached. The total work, apart from riveting up some of the end plates and doing a little calking on same, consisted of riveting up the total of 22 panels of sheathing in all four leaves, as against 15 last month, the equivalent of about one upstream and one-half of the downstream face of one leaf. There remain to be riveted on these four leaves, about 45 panels of sheathing out of a total of 104.

Upper gates, 77 feet high, leaves 33, 34, 35, and 36: Twelve panels of skeleton were erected during the month and the same number riveted up. As to sheathing, 30 panels were erected, which is equivalent to a little over one leaf. None of these sheathing plates has as yet been riveted up, and only a part of same fully adjusted and reamed.

Pedro Miguel—Upper guard gates, 4 leaves, 54 feet 8 inches high: The skeleton was brought to the top in all leaves except No. 52, and most of the skeleton riveted up. Forty-one panels of sheathing were erected, equivalent to about one complete leaf and one-half of another leaf, although many of these sheathing plates were not fully fitted nor reamed. Six panels of sheathing in all were riveted up.

The total tonnage erected December 1, without regard to its being riveted or fully fitted, is about 3,500 tons, out of a total of about 58,000 tons or 6.1 per cent; the total number of field rivets driven about 177,000, out of about 6,500,000, or about 3 per cent of the total.

INSPECTION OF OPERATING MACHINERY AND ELECTRICAL EQUIPMENT.

The force of this subdivision, reporting directly to this office, has cared for the technical matters relating to inspection as follows:

(1) *For the Stoney gate and cylindrical valve machines, purchased under Circular 614*—The first Stoney gate valve machine which was tested, was ordered shipped to the Isthmus, and the second machine was mounted for test.

(2) *For the rack railway and other material purchased under Circular 619, Circular 636-D and Circular 635*—For the different classes under these circulars which are now under contract, the state of completion of delivery varies from 6 to 50 per cent. On all portions of these contracts, satisfactory progress has been made during the month, with the exception of the carbon steel castings, (Class 2, Circular 619) which delivery is very much behind time.

(3) *For the gate operating machines, Class 1, and miter forcing machines, Class 2, purchased under Circular 627*—Satisfactory progress was made with the gate operating machine, but a second new main casting of the casing for the miter gate forcing machine was necessary.

(4) *For the gate and girder hoisting machinery for the emergency dams, purchased under Circular 616*—Tests are continuing upon the three types of worm gearing hoists to be tried out as a part of this contract, at the works of one of the sub-contractors, with a special view to determining the lubricant best suited for this heavy service.

The force installing machinery and electrical equipment on the Isthmus during the month placed hand rail and ladders for valves Nos. 260 and 261, and completed setting foundation bolts for miter gate machines Nos. 37 and 38. Cylindrical valve No. 558, was completed in place, except motor. Forms for decking over valve No. 558 are completed and ready for concrete. During the month 56 cubic yards of concrete were placed.

EMERGENCY DAMS.

The inspection work in the United States progressed satisfactorily during the month. Up to the 20th of the month a total of 288 drawings of the turning and wedging machinery had been approved; also a large number of drawings for vertical trusses of the same. At the works of the contractors, 817 tons of riveted nickel steel; 338 tons of riveted structural steel; 445 tons of carbon steel castings; 138 tons of carbon steel forgings; and about 260 tons of miscellaneous cast iron castings, vanadium gate wheels and vanadium steel castings, in all about 2,000 tons of material, have been fabricated. Satisfactory progress was also made on the roller bearings, all the roller bearings for one dam having been completed during the month.

AIDS TO NAVIGATION.

During the month 92 acres of land were cleared in the Gatun Lake section for sites for beacons and reference buoys, at an average cost of $15.59 per acre; 25,954 linear feet of trochas were cut; and the necessary land for making surveys was cleared and profile taken. Three buoys in the vicinity of Bohio, and three buoys at Pena Blanca were located and referenced during the month; and test holes were drilled to determine formation on the site of the front tower of Range No. 5-6, Atlantic Division.

Range No. 9-11—Work on the construction of Range 9-11, Pacific Division, continued during the month; the concrete entrance stair of the rear tower having been placed in position. The newel post of this tower was completed to a height of 16 feet, and the tower walls were given one coat of cement wash inside and outside. The front tower was also given one coat of cement wash on both the inside and the outside. The rip-rap at the base of caisson foundation pier was placed in position.

Range No. 13-14—The 29 bearing piles for the foundation of the front tower of range 13-14, were driven to depths from 18 to 25 feet; excavation to a depth of about 6 feet below the surface and work of armoring the piles is under way. The wooden forms for the foundation pier were constructed and considerable rock and sand has been delivered at the site of this tower. The excavation for the foundation of the rear tower was completed, 1,400 feet of Decauville track was laid from the shore to the site of the tower, and most of the building material delivered at the site.

Range No. 1-2—The foundation for the front tower was completed. The foundation for the rear tower was also completed, and the walls of the tower carried up to a height of 12 feet above grade line.

The steel forms for the Gatun Lake range towers were completed, and are to be delivered at Tabernilla dumps, where the first set of range towers in the Gatun Lake section will be erected.

Atlantic Division.

GATUN LOCKS.

Excavation—During the month one shovel was engaged on borrow pit excavation for the locks backfill, 36,024 cubic yards of material being removed.

Backfill—Backfill behind the side walls of the upper, middle and lower locks, and in the center wall of the upper lock, was continued. The quantity placed during the month aggregated 95,476 cubic yards, increasing the total to 1,008,942 cubic yards. On November 30 the backfilling was 64.67 per cent completed.

Receiving and Issuing Material—The unloading of sand was discontinued November 17. The receipts of rock exceeded the consumption by 4,574 cubic yards, and the consumption of cement exceeded the receipts by 13,405 barrels.

Mixing and Placing Plants—Both plants, and all portable mixers, were kept in satisfactory operation during the month.

Power Plant and Pumps—The operation of the power plant and pumps was satisfactory.

Iron and Steel Work—During the month 426.7 tons of fixed steel and 85,438 feet of reenforcing rods were placed; 37.8 tons of reenforcing rails and 33.2 tons of electric return track were laid.

Concrete Work—There was a decrease of 9,729 cubic yards in the amount of concrete laid as compared with the figures for the preceding month. The daily average for the 24 working days was 1,829 cubic yards, as compared with daily average during October of 2,063 cubic yards. The total amount of concrete placed during the month was 43,907 cubic yards, including 1,014 cubic yards of large stone. The bucket measurement exceeded the place measurement by 165.5 cubic yards. Of the total concrete, 4,782 cubic yards were placed in the upper lock, 5,963 cubic yards in the middle lock, and 33,162 cubic yards in the lower lock. The concrete work for the entire lock system was 85.88 per cent completed at the end of November.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS.

	Permanent Plant.	Auxiliary Plant.
Length of working day (bours)..	11.31	8.50
Average number of hours per day worked, per strand of cableway laying concrete and large stone (actual working time)	5.33	....
Average number of mixers per day	6.00	2.00
Average hourly output per mixer (actual working time), cu. yds.	57.20	88.45
Average amount of concrete and large stone laid per hour, per strand of cableway (actual working time) cu. yds.	30.73	....

GATUN DAM.

Construction during the month increased the total fill, as determined by cross sections of the material in place, by 473,760 cubic yards, making the total amount in place 16,674,512 cubic yards.

Hydraulic Fill—The dredges increased the hydraulic fill by 266,603 cubic yards. The total hydraulic fill in place on November 30 was 8,739,089 cubic yards.

Dry Fill—The material received from the Central Division, Mindi, and steam shovels Nos. 116 and 134, amounting to 207,157 cubic yards, was placed on the north and south toes of the dam, east and west of the spillway, making the total dry fill in place 7,935,423 cubic yards.

GATUN SPILLWAY.

Excavation—This work was not extended during the month.

Backfill—During the month 2,951 cubic yards of material were used in backfilling behind the west wall of the spillway.

Concrete—The work of placing concrete was continued. The amount placed during the month aggregated 2,417 cubic yards, which increased the total to 164,956 cubic yards. The concrete work for the spillway was 73.3 per cent completed.

HARBOR AND CHANNEL SECTION.

Excavation Below Sealevel at Mindi—During the month two steam shovels removed 3,590 cubic yards of earth and 51,129 cubic yards of rock from the canal prism.

Dredging from Ocean to Mindi—Six dredges removed 703,262 cubic yards of earth and 38,980 cubic yards of rock from the canal prism. On November 30th, 40 feet of water could be carried from zero to zero plus 1,900 feet; 35 feet to mile 3 plus 2,600 feet; 30 feet to mile 3 plus 3,700 feet; 20 feet to mile 5 plus 2,438.9 feet, the point of intersection with the French Canal. In addition to the above, the dredge *Caribbean* removed 9,685 cubic yards of earth from the approach channel to Cristobal docks.

PORTO BELLO.

PERFORMANCE OF ROCK CRUSHER PLANT.

Length of working day, hours............	8.00
Average number of hours worked per day..	4.16
Average number of cubic yards per hour of workingday..........................	224.96
Average number of cubic yards per working hour..............................	432.94
Maximum day's output (5 hours) cu. yds..	2,194.00
Average day's output (24 days) cu. yds....	1,799.71
Average hourly output (163 hours 55 minutes) cu. yds..........................	260.33
Total output for the month, cu. yds......	43,193.00

SAND, STONE, AND CEMENT SERVICE.

In connection with this service plant steamed 5,720 miles, handled 592 barges, and carried 1,730 passengers.

WEST BREAKWATER, COLON.

Seventeen thousand, two hundred and forty-nine cubic yards of material were excavated, all of which was dumped from the trestle. The double track trestle was extended 551 linear feet. On November 30 the trestle extended 8,018 feet from shore. During the month 4,117 cubic yards of Porto Bello rock were placed on the breakwater, making a total of 10,929 cubic yards used for that purpose to December 1. The total amount of rock dredged and dumped on the west breakwater to November 1, 1911, was 762,217 cubic yards. During the month 38,980 cubic yards of rock were dredged and dumped, increasing the total to 801,197 cubic yards. The amount of dry fill placed to December 1 was 523,904 cubic yards.

NOMBRE DE DIOS.

During the month 41 barges, containing 19,948 cubic yards of sand, were shipped to Gatun. Operations at Nombre de Dios were discontinued on November 17, and all plant and material transferred to Cristobal.

MUNICIPAL ENGINEERING.

The reservoirs, water mains, sewers, roads and oil pipe lines were maintained and extended as required to facilitate construction work.

Central Division.

During the month of November the total amount of material excavated in the Central Division was 1,224,796 cubic yards, of which 126,487 cubic yards were classified as earth and 1,098,309 cubic yards as rock. Of this quantity, 1,212,548 cubic yards were removed by steamshovels, and contractors removed 2,960 cubic yards by sluicing and 9,288 cubic yards by hand. Of the total, 1,221,746 cubic yards consisted of primary excavation for the canal prism, and 3,056 cubic yards were excavation for tracks outside of prism.

The daily average number of steamshovels at work during the month was 41.54, and the total number of shovel days was 997, as compared with 41.46 at work during the month of October, with 1,078 shovel days.

For comparison with the work done by steamshovels during the corresponding month of the previous year, the following table has been prepared:

Period.	Excavated by sbovels.	Classification of material.		Av. No. of shovels at work	W'kg days	Av. yards per shovel day.
		Rock.	Earth.			
1910:	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*			*C. Y.*
Nov....	1,444 567	1,053,077	391,490	49.13	24	1,225.20
1911:						
Nov. ..	1,212 548	1,089,021	123,527	41.54	24	1,216.19

Rainfall at Empire: 1910, 8.85 ins.: 1911, 11.73 ins.

The above table shows the average output per shovel to be 0.73 per cent greater in November, 1910, than in the corresponding month of the present year.

The total amount of material excavated from the prism in the Culebra Section of the Central Division in November, 1911, 1,209,498 cubic yards, was the highest record in that section for the month of November, except November, 1910, when 1,209,554 cubic yards were removed.

The total estimated amount of material to be removed in the Central Division, according to the revised estimate of July 1, 1911, was 101,801,296 cubic yards, and up to December 1, 1911, 84,065,024 cubic yards had been removed, leaving 17,736,272 cubic yards to be removed in order to complete all excavation in the Central Division. From these figures it will be seen that 82.58 per cent of all excavation in the Central Division had been completed up to the close of the month of November, and 17.42 per cent remained uncompleted.

Considering the two sections which compose the Central Division, the excavation completed and that to be completed at the close of November operations was as follows:

CULEBRA SECTION.	Cu. Yds.
Completed	72,151,742
To be completed	17,292,263

CHAGRES SECTION.	Cu. Yds.
Completed	11,913,282
To be completed	444,009

From the above figures it will be seen that the Culebra Section, locally known as the "Culebra Cut," was 80.67 per cent completed, with 19.33 per cent to be completed; the Chagres Section was 96.41 per cent completed, with 3.59 per cent to be completed.

During the month 32,569 cubic yards of material were hauled from the canal prism and dumped in the embankment for the roadbed of the relocated Panama Railroad. The total amount of spoil from the Central Division used for this purpose at the close of the month was 3,995,376 cubic yards. The Central Division also delivered at Gatun 184,681 cubic yards of rock and earth for use in the construction of the dam, making the total for this purpose at the end of November 4,854,299 cubic yards. During the month 4,243 cubic yards of rock and earth were furnished for the Colon breakwater.

The daily average number of laborers at work on the whole Division during the month was 7,750, and the daily average number of gold employes was 797.

Pacific Division.

DISTRICT NO. 1—LOCKS AND DAMS.

Excavation—The total excavation during the month amounted to 117,034 cubic yards, of which 23,524 cubic yards were classified as earth, and 93,510 cubic yards as rock.

Filling and Embankment—During November, 3,190 cubic yards of dry filling were added to the prism of the west dam at Pedro Miguel, increasing the total amount of material in place at the close of the month to 311,571 cubic yards. The backfill at Pedro Miguel was increased by 33,988 cubic yards, the total in place at the end of the month amounting to 437,288 cubic yards.

At Miraflores, 31,800 cubic yards were added to the dry fill in the toes, and 14,770 cubic yards to the hydraulic fill in the core of the west dam, making the totals at the end of the month 1,046,647 cubic yards and 661,048 cubic yards respectively. The backfill was increased by 42,200 cubic yards, the total aggregating 277,588 cubic yards at the end of the month.

PEDRO MIGUEL LOCKS.

The general backfilling of the lock walls was continued. One steamshovel commenced excavating material from the hill back of the east lock wall, casting over spoil to be used for backfill. The filling-in of the center wall with sand and screenings was continued. The amount of iron placed in the masonry aggregated 249,691 pounds.

Concrete Work—The total amount of concrete and large stone laid at Pedro Miguel was 19,622 cubic yards, as compared with 25,637 cubic yards during October. The concrete was placed as follows: 10,212 cubic yards in the east wall; 5,314 cubic yards in the center wall; 2,284 cubic yards in the west wall; 580 cubic yards in the floors; 546 cubic yards in the north center guide wall; 496 cubic yards in the southeast wing wall; and 190 cubic yards in the northwest wing wall.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT PEDRO MIGUEL.

Permanent plant consisted of two chamber cranes, placing.

Auxiliary plant consisted of three 2-cubic yard and four ½-cubic yard mixers. Auxiliary placing plant consisted of a daily average of 2.33 ½-cubic yard mixers discharging directly into forms and a daily average of 3.54 locomotive cranes or derricks,

85 cubic yards of concrete were mixed and delivered to the lock gate contractors.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)	8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	5.18	4.22
Average number of mixers per day	....	5.91
	Cu. Yds.	Cu. Yds.
Average hourly output per mixer (actual working time)	....	18.48
Average amount of concrete and large stone laid per hour, per chamber crane (actual working time)	48.33	....
Large stone laid	....	....
Concrete laid	6,009.00	13.613.00
Total concrete laid	6,009.00	13,613.00

MIRAFLORES LOCKS.

Dry excavation was continued in the lower lock, eight steam shovels being employed. Excavation for the culvert system, and the placing of concrete in the east wall of the lower lock were commenced during the month. The backfilling of the east and west lock walls, also filling on the east and west toes of the west dam were continued. The sinking of the foundation caissons for the north center guide wall, and the construction of concrete caisson cylinders were continued. During the month the amount of iron placed aggregated 733,780 pounds.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT MIRAFLORES.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)	8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	5.63	6.68
Average number of mixers per day	6.79	5.21
	Cu. Yds.	Cu. Yds.
Average hourly output per mixer (actual working time)	29.02	28.96
Average amount of concrete and large stone laid per hour, per berm, or chamber crane (actual working time)	44.30	....
Large stone laid	....	....
Concrete laid	19,143.00	22,583
Total concrete laid	19,143.00	22,583

Permanent plant consisted of 4 berm and 2 chamber cranes.

Auxiliary plant consisted of two 2-cubic yard mixers and a daily average of 3.33 ½-cubic yard mixers, and a daily average of .54 derricks.

Concrete Work—The total amount of concrete and large stone laid at Miraflores was 41,726 cubic yards, as compared with 60,873 cubic yards during October. The concrete was placed as follows: 7,593 cubic yards in the east wall; 11,665 cubic yards in the west wall; 20,537 cubic yards in the center wall; 1,810 cubic yards in the floors; and 121 cubic yards in the north center guide wall.

DISTRICT NO. 2—DREDGING.

The following is the statement of the output of the five dredges which were in operation during the month, and of the amount of material excavated hydraulically:

DREDGE.	Type.	WORK.		PLANT.		Total.	Remarks.
		Earth.	Rock.	Earth.	Rock.		
		Cu. Yds.	Cu. Yds.	Cu. Yds.	Cu. Yds.	Cu. Yds.	
Cardenas	Dipper	15,803	22,741	....	....	38,544	Place measurement
Marmot	Ladder	33,418	6,684	....	....	40,102	Place measurement
Badger	Ladder	116,194	....	....	....	116,194	Scow measurement
Mole	Ladder	2,800	4,550	....	....	7,350	Scow measurement

Grand Total	....	428,308	33,975	1,898	....	464,181	

*Excavated from Canal prism, south of Miraflores lock site.

CHAMÉ SAND EXCAVATION.

Approximately 35,803 cubic yards of sand were excavated at Punta Chame and delivered at Balboa.

DISTRICT NO. 3—MUNICIPAL AND SANITARY ENGINEERING.

The reservoirs, water mains, sewers, roads, and oil pipe lines were maintained and extended as requred to facilitate construction work.

Work was continued on the Panama street improvements.

DISTRICT NO. 4—ANCON QUARRY.

PERFORMANCE OF ROCK CRUSHER PLANT.

Length of working day (hours)	8.00
Average number of hours per day (actual working time)	7.08
Average number of cubic yards crushed per hour of working day	297.76
Average number of cubic yards crushed per working hour	355.47
Total output for the month, cubic yards	60,430.00

Relocation of Panama Railroad.

During the month 322,021 cubic yards of material were excavated, increasing the total excavation at the close of the month to 9,276,059 cubic yards, and 350,201 cubic yards of material were placed in embankment, increasing the total for this purpose to 15,161,518 cubic yards.

The average daily number of steamshovels at work was 10.79, and the total number of working days was 24.

For comparison with the work done by steamshovels during the preceding month, and during the corresponding month of the previous year, the following table has been prepared:

Period.	Excavated by shovels.	Classification of material.		Av. No. of shovels at work.	W'k'g days.	Av. yards per shovel day.
		Rock.	Earth.			
1910:	Cu. Yds.	Cu. Yds.	Cu. Yds.			C. Y.
Nov.	227,510	125,265	102,245	6.00	26	1,580
1911:						
Oct.	367,085	229,865	137,220	10.38	26	1,360
Nov.	316,010	223,155	92,855	10 79	24	1,220

No temporary trestle was driven during the month. Work on bridges and culverts was continued. Three thousand four hundred and fifty-five feet of 70-pound track were relaid with 90-pound track, the total of 70-pound and 90-pound track at the end of the month being 131,145 feet and 46,008 feet respectively. The force averaged 2,456 men.

Quartermaster's Department.

LABOR.

The labor situation continued satisfactory.

QUARTERS.

The removal of families from the Tabernilla District continued, and at the end of the month there remained 30 families in quarters in that district.

BUILDING CONSTRUCTION.

An additional sum of $25,000.00 was allotted by the War Department for the construction of quarters for the 10th Regiment U. S. Infantry. It is intended to move two type-18's, two type-5's, and the hotel from the San Pablo-Tabernilla District. Work was started on the removal of one-type 5, one type-18, and the hotel.

MATERIAL AND SUPPLIES.

The value of material received from the United States during the month was $494,-152.20. Supplies during the month were delivered by 31 steamers, the total weight of cargo aggregating 23,264 tons, exclusive of 754,154 feet B. M. yellow pine lumber, 397,-164 feet B. M. Douglas fir lumber, 66,206 feet B. M. white oak lumber, 2,026 pieces of piling, and 48,158 cross ties.

Subsistence Department.

The operation of the European laborers' messes, the colored laborers' kitchens and the line hotels showed a net profit of $1,103.53. The operation of the Hotel Tivoli showed a net profit of $2,682.78, and there was a net profit on restaurants, penitentiary, tugs and dredges of $29.09. The net profit on subsistence operations was $3,815.40.

Department of Civil Administration.

COURTS.

During the month one civil and two criminal cases were disposed of in the Supreme Court, 15 civil and 71 criminal cases in the Circuit Courts, and 182 civil and 526 criminal cases in the District Courts.

DIVISION OF POSTS, CUSTOMS, AND REVENUES.

Money order sales for November amounted to $486,993.73, and the fees to $2,303.24. Receipts from stamp and card sales, and newspaper postage aggregated $6,880.26. The total collection of revenues made by the Division was $15,578.92, and the collection on account of court fines, costs, and fees, $3,246.20.

Thirty vessels entered at and thirty vessels cleared from the port of Ancon, and nineteen vessels entered at and eighteen vessels cleared from the port of Cristobal.

DIVISION OF POLICE AND PRISONS.

The total number of persons arrested was 536, of whom 495 were men and 41 women. Twenty nations, or 42 separate states and dependencies, were represented. The total number of arrests for the month was a decrease of 93 as compared with the month of October. Eighteen convicts were committed to the penitentiary, and 11 were discharged, leaving 143 in confinement at the close of the month. The cost of guarding and subsisting the convicts was $2,943.66, and the value of their work on Canal Zone roads $2,158.10.

DIVISION OF FIRE PROTECTION.

Ten fires were reported in the Canal Zone during the month, as compared with 7 in October. The damage to Commission property was $51.80, and to private property $2.50.

DIVISION OF PUBLIC WORKS.

In the city of Panama the average daily consumption of water was 1,406,599 gallons, and in Colon, 968,384 gallons.

The usual inspection and maintenance work of this division was performed during the month.

DIVISION OF SCHOOLS.

A new white school at Porto Bello was opened on November 6, with an attendance of 14 pupils. The new colored school building at Ancon was opened on November 27, with an attendance of 47 pupils. The total enrollment in the white schools during the month was 1,262, and the average daily attendance 1,012.8, or 80 per cent of the enrollment; and in the colored schools the total enrollment was 1,093, and the average daily attendance 687.8 or 63 per cent. Forty-five white and 26 colored teachers were employed in the division on November 30.

Department of Sanitation.

The total number of deaths from all causes among employes was 41. These were divided as follows: From disease, 33, and from violence, 8, giving the annual average per thousand of 7.85 and 1.90 respectively.

The annual average death rate per thousand among employes for the month of November in previous years since American occupation was as follows:

1904	14.47
1905	38.09
1906	30.61
1907	20.66
1908	11.50
1909	15.27
1910	14.92

The annual average death rate per thousand in the cities of Panama, Colon, and the Canal Zone, including both employes and non-employes, was 20.29.

The annual average death rate per thousand for the month of November among the same class of population for previous years was as follows:

1904	34.31
1905	58.00
1906	35.76
1907	28.86
1908	23.71
1909	19.14
1910	25.21

Segregating the whites from the blacks, the annual average death rate per thousand from disease among employes was for whites, 6.62, blacks, 8.27, giving a general average of 7.85. For the same month during 1909, the annual average death rate per thousand from diseases was, whites, 5.88, blacks, 11.31, giving a general average of 10.26, and for the same month during 1910, whites, 5.55, blacks, 12.59, giving a general average of 10.69.

Among employes during the month deaths from the principal diseases were as follows: Amoebic abscess of liver, 1; chronic nephritis, 1; dysentery, clinical, 1; haemoglobinuric fever, 2; lobar pnemuonia, 11; malaria fever, E. A., 3; tuberculosis, disseminated, 4, leaving a balance of 10 deaths from all other diseases, and 8 deaths from external violence.

No cases of yellow fever, small pox, or plague originated on or were brought to the Isthmus during the month.

Respectfully,
Geo. W. Goethals, *Chairman.*

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Las Cascadas, C. Z., Sunday, December 24, 1911, at 6 p. m.

The next concert will be given at Corozal, December 31, 1911, at 7.30 p. m.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

The standing of the teams in the Isthmian Basket Ball League on December 16, was as follows:

Team.	Won.	Lost.	P.C.
Cristobal	9	0	1.000
Gatun	7	3	.700
Culebra	5	4	.556
Gorgona	5	4	.556
Corozal	1	8	.111
Empire	1	9	.100

Following is the moving picture schedule for the week December 25 to 30: Monday, Gorgona: Tuesday, Gatun; Wednesday, Cristobal; Thursday, Culebra; Friday, Empire; Saturday, Corozal.

CULEBRA.

The basket ball game between Gorgona that was scheduled for Friday night, was postponed to Tuesday evening, December 19, 1911.

The billiard tournament closed on Saturday evening with the following results:

Name.	Handicap.	Won.	Lost.
Tragsforf	100	9	2
Dubois	90	9	2
Vogel	100	8	3
Hepler	75	7	4
McCann	65	7	4
Peters	50	6	5
Byer	75	5	6
Conlon	100	5	6
Janney	65	4	7
Thomson	90	3	8
Herz	65	2	9
Case	65	1	10

The tie between Tragsdorf and Dubois will be played during the week, which will decide who is entitled to the medal.

The Christmas exercises will be held at the clubhouse on Saturday evening. The Sunday school children will give an entertainemnt.

EMPIRE.

The Cristobal duck pin bowlers took four out of six of the match games bowled on Saturday, December 16.

Those who wish to enter the New Year's duck pin tournament to be held at Cristobal are requested to leave their names at the desk.

Eighteen men have entered the handicap pool tournament which started on December 13.

The standing of those who have played games in the chess tournament is as follows:

Name.	Won.	Lost.
Pulsifer	4	0
McCullough	2	0
Sherfey	3	3
Newbold	0	1
Warr	0	2

New books for the library will be ordered soon. Anyone having names to suggest will please leave them at the desk.

GATUN.

"Qualities That Make a Man" was the subject of an address given before the Drop-in-Discussion Club by J. Dwight Safford, Secretary of the Y. M. C. A. at Camp Elliott, on Sunday evening at 6 o'clock. Twenty-nine men were present.

The following new gymnasium equipment was added last week: German horse, climbing rope and large punching bag platform.

The local handicap pool tournament will close on Saturday night, December 23. Messrs. Hughes, Miller, Bailey and Shailer are now tied for first place. Mr. Hughes leads for the prize of a cue for high run with 26 balls to his credit. The second place is being contested between Harold and Lenow. There will also be a booby prize.

A rag time duck pin tournament was started on December 14.

CRISTOBAL.

At the session of the Debating Club on December 13 it was unanimously voted to omit the regular sessions scheduled for December 27 and January 3, respectively, because of the holiday season.

On Tuesday evening, December 19, there will be another chess fest. A series of progressive chess will be played, entry being free and open to all members.

On Thursday, December 21, a series of progressive checkers will be played under the auspices of the Checker Club. Entries will be free and open to all members.

On Monday evening, December 25, there will be a free concert in the Auditorium by the 10th Infantry Band from Las Cascadas. The public is invited to attend.

The plan is under consideration for the organization of a Spanish class in the near future. Should a registration of 15 names be secured, the class will be formed. Terms, $2.50 in advance for 10 lessons. Any one desiring to attend will please make that desire known at the office as soon as possible.

On Monday, January 2, the Isthmian duck pin tournament will occupy the local alleys for the day.

OFFICIAL CIRCULARS.

Christmas and New Year's Days.

CULEBRA, C. Z., December 12, 1911.

CIRCULAR No. 424.

Christmas Day, December 25, 1911, and New Year's Day, January 1, 1912, will be observed as holidays in the Canal Zone, and, as far as practicable, all public business will be suspended on those days.

GEO. W. GOETHALS, *Chairman.*

Workmanship and General Conduct on Termination of Service Forms.

CULEBRA, C. Z., December 13, 1911.

CIRCULAR No. 309-A.

The form on which the termination of service of employes on the gold roll is reported to this office requires that general workmanship and general conduct must be described as excellent, good, indifferent, or poor.

Hereafter the re-employment of any employe whose service is terminated with a record of indifferent or poor general workmanship or general conduct, or who is discharged for cause, will not be authorized.

Care should be exercised in the use of the term *general* workmanship and conduct.

Cases presenting special or unusual features will be decided upon their merits by this office.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Acting Assistant Engineer in Charge of the Third Division.

CULEBRA, C. Z., December 12, 1911.

CIRCULAR No. 425.

Effective this date, Mr. Guy O. Fraser, Junior Engineer, will be in charge of the work of the Third Division of the Office of the Chief Engineer during the absence of Mr. C. M. Saville, Assistant Engineer, on leave.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Grass Cutting by the Quartermaster's Department.

CULEBRA, C. Z., December 1, 1911.

CIRCULAR No. 183-F-4.

Effective this date the following regulations will govern the performance by the Quartermaster's Department for the Department of Sanitation on the Isthmus of the work covered thereby:

GRASS CUTTING.

1. All grass cutting on new areas which have not previously been cut, or areas that have not been cut by the Sanitary Department within two years, if they exceed two acres in extent, will be requested on form C. E. 159, and forwarded by the Chief Sanitary Officer for approval by the Chairman before this work is commenced.

2. All other requests for grass cutting in each district will be submitted to the District Quartermaster by the Sanitary Inspector on Monday morning of each week. Such work requests will indicate the area number on the work request, this area number to correspond with the area number on the map. Should only part of an area need cutting, this part will be designated on work request by area number and specified as north, east, south, or west portion. The particular portion of the area will be designated on the ground by stakes placed by the Sanitary Inspector.

3. The unit of measurement will be the square yard. All work requests will state the number of square yards and estimated cost.

4. District Sanitary Inspectors should indicate on work requests, when practicable, whether the work is to be done by horse mower or scythemen.

5. Execution slip on work requests will be sent to the District Sanitary Inspector by the District Quartermaster, immediately on completion of the work, and the District Sanitary Inspector shall inspect the work and sign the execution slip if the work has been satisfactorily performed. If not, he shall return the execution slip with written memorandum to the District Quartermaster, stating wherein the work is unsatisfactory.

6. In cases where the District Quartermaster and the Sanitary Inspector cannot adjust any differences, they will at once refer the matter to the heads of their respective departments, and take no further action, pending instructions from the heads of their departments.

METHODS OF ACCOMPLISHING THE WORK.

7. All grass cutting, wherever practicable, will be done with horse mowers, and raked with horse rakes. Where this is not practicable, it will be cut with scythes, and by machetes when mowers and scythes cannot be used.

8. Grass will be disposed of in the most economical manner. It will be burned whenever practicable.

9. Grass cut in water or on wet land should be removed to dry land on the day it is cut, whenever possible.

10. All grass cut along sides of ditches and falling into the ditches shall be removed as soon as possible.

MISCELLANEOUS.

11. District Sanitary Inspectors shall submit requests to District Quartermasters for repairs to screening and rendering houses mosquito proof, on Monday of each week. Work requests will specify house number, location, and nature of repairs required.

12. Sanitary Inspectors will on Wednesday of each week go through all places mentioned in work requests with the District Quartermaster, or employe designated by him, and point out defects mentioned in the work requests.

13. District Quartermasters will, on request of District Sanitary Inspectors, collect and destroy in manner indicated by the latter, all cans, bottles, and other breakable containers. The cost of this work will be reported separately from the cost of the grass cutting and garbage removal.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Acting Assistant Chief Sanitary Officer.

ANCON, C. Z., December 19, 1911.

SPECIAL ORDER:

During the absence on leave of Lieut.-Col. John L. Phillips, Assistant Chief Sanitary Officer, Dr. M. E. Connor is assigned as Acting Assistant Chief Sanitary Officer, and as such, in accordance with paragraph 2, minutes of the 119th meeting of the Isthmian Canal Commission, held in Washington, D. C., January 12, 1907, is authorized to approve for payment all vouchers, payrolls, and public bills relating to this Department "By direction of the Chief Sanitary Officer."

W. C. GORGAS, *Chief Sanitary Officer.*

Employes' Twenty-four Trip Tickets.

CULEBRA, C. Z., December 13, 1911.

HEADS OF DEPARTMENTS AND DIVISIONS:

A supply of blank Employes' Twenty-four Trip Tickets for 1912 is being forwarded to you today under separate cover.

The rules governing the issuance and use of these tickets, as set forth in circular from this office dated December 16, 1910, will be followed for the ensuing year.

Through an error on the part of the printer in reading copy the instructions appearing on the 1912 ticket require the employe to sign coupons in the presence of the conductor. This requirement was discontinued some time ago, and employes will continue to fill out and sign coupons before entering train, to facilitate the collection of transportation. Please bulletin this fact throughout your division in order that there may be no misunderstanding.

By direction of the Chairman.

Respectfully,
C. A. MCILVAINE, *Chief Clerk.*

Care in Use of Water.

CULEBRA, C. Z., December 18, 1911.

CIRCULAR No. 365-B-:

A necessity exists for restricting the use of water from the reservoirs in the Canal Zone during the dry season.

The use of garden or other hose for watering plants and flowers is prohibited except by authorized gardeners and employes of the Quartermaster's Department.

District Quartermasters are directed to report all leaks in faucets or pipes and all violations of this order.

GEO. W. GOETHALS, *Chairman.*

Notice to Ship Masters.

BALBOA, C. Z., December 16, 1911.

An obstruction buoy has been placed in the center of the channel, a short distance south of Panama Railroad Pier, and you are hereby notified that it is not considered safe to pass to the eastward of this buoy when drawing more than 20 feet and at the extreme low tide. Should it be necessary to enter or depart on a deeper draft than 20 feet, vessels should pass to the westward of the buoy.

J. ST. C. HUNT,
Port Captain.

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending December 27, 1911, (75th meridian time):

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Foundation for Emergency Dam.

Preparations are being made to drive concrete piles in a portion of the east backfill of Gatun Locks, about 200 feet above the upper guard gates, for a foundation for the emergency dam for the east chamber. The main feature of the dam, which was described in THE CANAL RECORD of March 8, 1911, is to be a steel truss bridge of the cantilever type, from which will be dropped the wickets to hold in place the sliding panels of the dam proper. The bridge will be pivoted upon the side wall of the chamber and, when not in use, will lie parallel to the axis of the locks; when placed for use, the long, or dam, arm will extend across the chamber and the short arm, at the end of which is the operator's house, will have swung through a quadrant till it extends out over the backfill. The piles are to afford a foundation for the tracks for this quadrant.

Accident to the Dredge Corozal.

The ladder dredge *Corozal* which was launched at Renfrew, Scotland, on September 13, and set out on its way to Balboa by way of the Strait of Magellan under its own steam on December 1, was compelled to return to Falmouth owing to bad weather and to five broken frames at the forecastle above the water line. After repairs are made the *Corozal* will resume its voyage.

Pedro Miguel and Miraflores.

Excavation is in progress for the sills for the emergency dams at Pedro Miguel Lock. The floors of the upper approaches will be laid after the concrete for the sills is in place. The McClintic-Marshall Construction Company has completed the erection of its new construction bridge over the site of the lower lock gates and the foundation panels for those gates have been laid. The Central Division is dumping spoil at the west end of the north side of Pedro Miguel Dam. This is the beginning of dry season operations at the Dam and the greater part of the remaining work will be done this season.

Thirty-one caissons for the cellular approach wall at the upper end of Miraflores Locks are down to rock. Four of the specially devised excavation platforms, using a series chain connection from a steam engine, have been placed in operation. In addition, 11 star drill engines and trestles are being used for hauling up dirt at other caissons. The six-foot sections of caisson shell are moulded at an auxiliary concrete plant near the large cement shed west of the locks, where collapsible forms are placed in a row on a platform along a spur track and filled from a $\frac{1}{2}$-cubic yard portable mixer, mounted on a railway truck. When hardened, the sections are handled and placed by means of a locomotive crane.

Proposed Canal Legislation.

Two bills were introduced in the House of Representatives on December 5, by Mr. Knowland of California. The first provides for the payment of tolls and transit charges on vessels owned by the United States and merchant vessels of the United States engaged in the "coastwise" trade passing through the Panama Canal. There is a proviso that the act shall not apply to vessels in the "coastwise" trade owned in whole or in part by any railroad company, and that the ships favored by the act may be used by the Government at any time as auxiliaries to the Army and Navy, upon payment of the value at the time they are taken.

The second bill provides for the operation of the Canal. The President is given power to provide for the operation of the Canal, fix charges for its use of not over $1.50 nor less than 50 cents per registered ton, American measurement, excepting vessels of the United States and its citizens and vessels of the Republic of Panama, and excepting also that the President may charge the highest rate to vessels engaged in the "coastwise" trade of the United States owned in whole or in part by a railroad company. Vessels accepting free tolls are to be at the disposal of the Government upon payment of actual value at the time of taking. The President is further authorized to establish, maintain and operate dry docks, repair shops, yards, docks, wharves, warehouses, and storehouses.

On December 6 Mr. Roberts of Nevada introduced a bill in the House of Representatives designed to prevent interstate railroads from owning or controlling ships or vessels engaged in trade or commerce through the Canal. It provides that no ship or vessels owned or controlled by any railroad company or corporation engaged in interstate commerce shall be permitted to engage in trade or commerce through the Canal, and provides a fine of not over ten thousand dollars nor less than one thousand, or imprisonment for not more than twelve months nor less than one month for any officer of such a company who knowingly violates or permits the violation of the law.

On December 11 Mr. Lodge of Massachusetts introduced into the Senate a bill providing that all tolls and transit charges which may be imposed upon public vessels or merchant vessels of the United States for passing through the Canal shall be paid from the United States treasury.

Towing Locomotives Award.

Award has been authorized to the General Electric Company of the contract for one electric locomotive for towing ships through the locks, and a provisional award of 39 other locomotives, if the first one proves satisfactory. Five bids for the 40 machines were received, the highest being $827,395.95, and the lowest $498,016.35, that of the General Electric Company. The award was made on the regular bid, in which carbon steel was specified, the optional bid being for vanadium steel. The first locomotive is to be delivered on the Isthmus within 260 days from the award of the contract.

An article descriptive of the locomotives was published in THE CANAL RECORD of September 27, 1911. The machine consists of two tractors, between which is carried a truck bearing a windlass. The locomotives moves along the lock walls on rack track while towing and by friction, except at inclines, when running light. Power is taken from a third rail. Four of the locomotives will be used on each ship, two in front on either wall of the lock, and two behind. Hawsers from the windlass of each locomotive will hold the ship steady while it is passing through, the forward hawsers towing the ship, and those at the rear towing the two rear locomotives.

Hardwood Ties for Relocated Line.

The Panama railroad has made a contract with H. B. Howland of Santo Domingo for seventy-five thousand hardwood ties to be used on the relocation of the railroad. They are to be of the wood known as bayahonda, a sample of which has been approved.

Two classes will be accepted, the first or standard being 7 inches thick, 9 inches wide on face, 8 feet 6 inches long, with a variation allowed from the straight edge on top and bottom of one-half inch, and on sides of 2 inches; second class, $6\frac{1}{2}$ inches thick, 8 inches wide on face, 8 feet 3 inches long, maximum variation from straight edge of one inch at top and bottom and 3 inches on sides. The second class ties may not aggregate over ten per cent of the total number delivered. The ties are to be hewed square and cut evenly at the ends. Delivery must be begun by March 1, 1912, and at least 8,000 ties must be delivered every two months thereafter, the entire delivery to be completed by June 30, 1913.

The purchase of hardwood ties from Santo Domingo is made after efforts to obtain a sufficient number on the Isthmus have failed. There is hardwood in Panama, but no one was

NOTES OF PROGRESS.

(Continued.)

found who would guarantee to deliver so large an order of ties at a reasonable rate. Several contracts or agreements have been entered into with other parties but in all cases the contractors have failed. When the railroad was being constructed in 1850-1855, although it ran through virgin forest, it was necessary to import ties from Colombia, because the Isthmus could not furnish them. Although the initial cost of hardwood ties is about twice that of the softwood ties purchased in the States, and it is more expensive to lay them since each tie must be bored for the spikes, they are more economical because they last many times as long.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 73 per cent completed, 165,949 cubic yards, out of a total of 225,000, having been placed at the close of work on December 23. A statement of the amount laid each working day last week, and of the total in place, follows;

DATE.	Concrete Laid.	Hours worked.	No. Mixers.
December 18	184	8.00	1
December 19	180	8.00	1
December 20	54	3.00	1
December 21	76	3.00	1
December 22	134	6.30	1
December 23	48	2.30	1
Total	676	31.00	1
Previously reported	165,273		
Grand total	165,949		

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending December 23, follows:

DATE.	Hours worked.	Cubic Yards.
December 18	7.45	2,723
December 19	4.30	1,934
December 20	8.20	2,869
December 21	7.15	2,380
December 22	7.50	2,890
December 23	7.30	3,305
Total	43.10	16,101

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending December 23, follows:

DATE.	Hours worked.	Cubic Yards.
December 18	3.43	1,657
December 19	3.50	1,850
December 20	3.16	1,529
December 21	3.38	1,716
December 22	3.57	1,752
December 23	3.31	1,698
Total	21.55	10,202

Aids to Navigation.

The Panaman Government has had a red light placed on the buoy at the entrance to the Bay of Panama to indicate the shoals at Calafate Point.

Society of the Chagres Year Book.

The first year book of the Society of the Chagres is almost ready for distribution. One section contains the constitution of the Society, the list of charter members, a list of members who had joined prior to December 20, 1911, with their addresses on the Canal Zone and in the United States, and biographical sketches of two hundred of the present membership of 250. The second section of the book contains the speech made by President Roosevelt to employes on the Canal at the Administration Building in Culebra in 1906, the speech he delivered on Dock 11, at Cristobal upon the occasion of his departure for the States; an account of the farewell reception to former Chief Engineer John F. Stevens on Dock 11, in 1907, upon the occasion of his departure, the speech made by Col. G. W. Goethals at Corozal upon his arrival on the Isthmus, and an extract from the speech made by President Taft at Paraiso on November 15, 1910.

CONCRETE WORK IN THE LOCKS.

Over 74 per cent of the concrete for the locks is in place, the amount at the close of work on December 23, being 3,128,727, cubic yards, out of a total of approximately 4,199,400. A total of 25,786 cubic yards of concrete was laid in the locks during the week ending December 23.

GATUN LOCKS.

Over 87 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on December 23 being 1,757,126 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending December 23, and of the total, follows; and similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone.	Total.

ELECTRIC SHOCK.

Rules for First Aid to Persons Shocked by Electric Current.

In view of the increasing use of electricity at the locks and of several accidents of recent occurrence, the Sanitary Department authorizes the publication of the following directions for rendering first aid to a person suffering from electric shock.

The first thing to do is to remove the body from contact with the conductor, or interrupt the flow electricity through the conductor. If in doubt as to the strength of current passing through the conductor with which the body of the person is in contact, the body should not be touched with the bare hands unless the person attempting the rescue is standing on an insulated surface, nor must the rescuer permit his own body to come in contact with the conductor.

If a switch is handy it should be opened before rescue is attempted.

Rescue must be carried out as promptly as possible, for the danger is much increased the longer the electrical current is permitted to pass through the person.

If possible, the rescuer should insulate himself by covering his hands with rubber gloves, mackintosh, rubber sheeting, several thicknesses of silk or even absolutely dry cloth. In addition, he should if possible complete his insulation by standing on a dry board, several layers of dry paper, or on a folded dry coat, or wear rubber shoes or boots.

If the conductor is under the body and the ground is dry, it is perfectly safe to stand upon it and to pull the person off the wire with the bare hands, but the hands of the rescuer should touch the clothing only, and this should not be done when the clothing is wet nor when the current is very powerful.

The conductor may be lifted from a person in contact with it with a dry board or stick. A long stick or board should be used and care be taken that only dry lumber is employed.

In removing a conductor from a person or a person from a conductor, it should be done with one rapid motion, as rocking a person to and fro on the conductor will increase the shock and burn.

It may be occasionally best to cut a live wire before any attempt at rescue is made. This may be done safely with an axe or hatchet provided with a long dry wooden handle or with a pair of properly insulated pliers.

TREATMENT OF PERSON AFTER RESCUE.

Send for a doctor at once. Loosen clothing around neck, chest and abdomen. Start artificial respiration. Keep it up for at least thirty minutes if he does not breathe earlier without it. Keep the patient as warm as possible.

The easiest method of carrying out artifical respiration is as follows—Lay patient face downwards with his chest resting on a tight roll of clothing or cloth at least eight inches in diameter. Stand across him facing the patient's head. Place your hands on the back of the patient's chest just below the shoulder blades with your fingers extending along the sides of the chest. Have some one hold the patient's head away from the ground and level with the rest of the body. Press down with your hands on the back of the patient's chest at the rate of twenty times per minute, that is, bear down, count four, let up, count four, bear down, count four, etc. Keep this up until the patient begins to breathe naturally or until the doctor arrives. As soon as the patient begins breathing discontinue artificial respiration but start it immediately again if the patient stops breathing.

Sometimes the tongue drops down against the gullet. Before commencing artificial respiration it is well therefore to pry open the mouth, using a stick if necessary, and look into the mouth to see that the tongue has not dropped back. If it has dropped back, get someone to get hold of it with a handkerchief or cloth and hold it while artificial respiration is being given, at the same time keeping the mouth open with some object such as a stick or handle of a knife.

While artificial respiration is being given have the patient's legs vigerously rubbed.

Do not assume that an unconscious man is dead. Shocks from even high voltages are not necessarily fatal. Keep up the work of stimulation and artificial breathing at least till a physician arrives. Shock produces a form of paralysis, which the movements seek to counteract.

American Institute of Electrical Engineers.

About two hundred members of the American Institute of Electrical Engineers will arrive on the Isthmus, one ship from New York and one from New Orleans, on Thursday, January 26. The visit will last one week.

Masonic Banquet.

A special train for the Masonic banquet at the Washington Hotel, Colon, given by Sojourners' Lodge No. 874, will leave Panama at 7.15 p. m. on Saturday, January 30.

Postal Business and Canal Zone Revenues.

During the month of November there were 23,256 money orders issued, amounting to $487,090.57. Of this amount, $370,540.80 was issued payable in the United States, $115,603.22 in the Canal Zone, $636.55 in Martinique, and $310.00 in Cost Rica. The fees amounted to $2,303.21, and the amount of orders paid and repaid was $128,493.32.

Postal sales during the month amounted to $6,862.00, and newspaper postage to $18.26.

The revenue collections for the month were as follows:

Bicycle and Chauffeur licenses	$29.00
Distillation licenses	10.80
Motor Vehicle licenses	111.00
Taxes, licenses, etc	6,180.42
Total	$6,331.22

Missing Men.

Any one having information regarding the whereabouts of Meredith Dryden of North Plainfield, New Jersey, who is believed to be on the Isthmus of Panama, is requested to communicate with the American Legation, Panama.

Any one having information regarding the whereabouts of George W. Smith, formerly of Pinegrove, Pa., who is supposed to be on the Isthmus of Panama, is requested to communicate with THE CANAL RECORD.

The Woman's Foreign Missionary Society of the Methodist Episcopal Church, Panama, will hold its next meeting on January 12, and not on January 18, as stated in the issue of THE CANAL RECORD for December 13. Mrs. L. M. Kent will entertain the society in the Commission chapel at Paraiso.

RAINY SEASON OF 1911.

Least Fall of any Season During American Occupation.

The accumulated rainfall during the rainy season of 1911 was the lowest during the American occupation. This statement is based upon the assumption that the dry season has begun, as all appearances indicate it has. The totals are below normal at all stations, the deficiency from the normal varying from 3 per cent at Colon to about 35 per cent at San Pablo, Tabernilla, and Bohio. The wet season with the lowest rainfall previous to 1911 was that of 1908 in the Central and Pacific sections, and 1907 in the Atlantic section.

In the tables below the accumulated rainfall for 1911 is given, as compared with that for 1908, and with the average for the years of record; and there is also given the discharge of the Chagres River at Gatun, as compared with that for 1908, and with the mean for 22 years of record.

ACCUMULATED WET SEASON RAINFALL, MAY 1 TO DECEMBER 1, 1911—(AMOUNTS IN INCHES.)

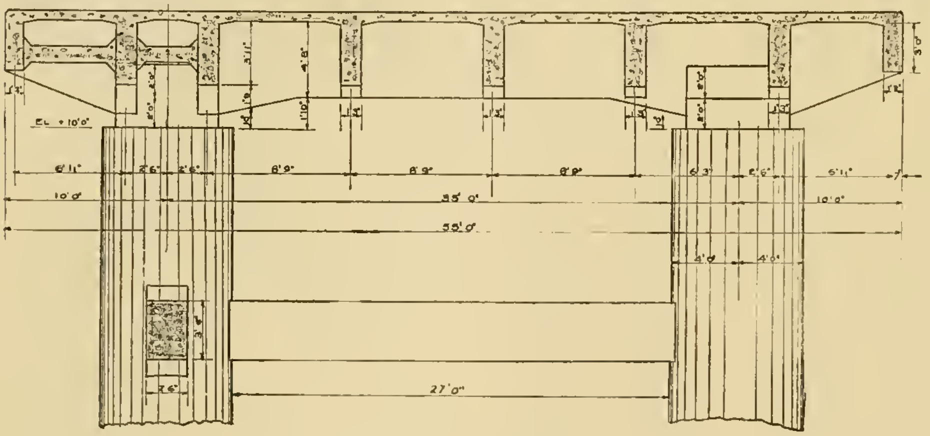
LOST—In Colon between the Y. M. C. A. and the Panama railroad office on December 8, a gold breast pin with design of an engineer's transit and level, with "Pratt Institute of Brooklyn" in gold letters. A reward is offered if returned to R. L. Mendes, care of Chief Engineer, Panama Railroad Company, Colon.

LUMBER WHARF AT BALBOA.

First of Permanent Harbor Improvements at Pacific Entrance.

The essential features of the concrete lumber wharf at Balboa, the first of the permanent improvements to be constructed in the harbor at the Pacific end of the Canal, are two rows, 35 feet apart, of solid concrete caissons, 8 feet in outside diameter, placed on 30-foot centers; main girders, resting on every set of caissons and extending the width of the wharf, 55 feet; 8 axial beams, bridging the spaces between the main girders and heavily reinforced at their junctures with them; and on these supports, a concrete floor, 6 inches thick.

The tops of the caissons are 10 feet above mean sealevel; the surface of the floor is at elevation +17. The concrete filling for the caissons, which is reinforced from ground rock to top with four double rows of French rails, connected by fishplates, is continued into the forms for the main girders, the girders and the caissons thus being set monolithically. The ends of each girder are embedded in a block of concrete 5 feet wide at the bottom, where they join the caisson filling; having rectangular cross-section in the parts projecting beyond the caissons, being 30 inches thick and 4 feet 8 inches deep. It is reinforced with 16 bars of 1- and 1¾-inch twisted steel, enclosed in stirrups of twisted ½-inch bars. The juncture of a main girder with a cassion is shown in sketch (A).

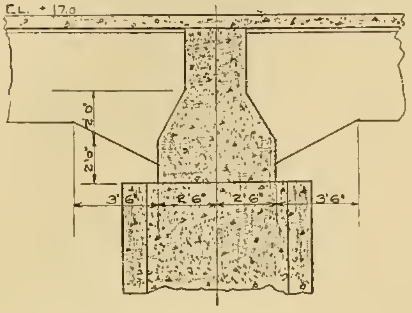


(B) CROSS-SECTION BETWEEN PIERS.

The longitudinal beams between girders are shown in sketch (B). On the water side of the wharf will run a railway track, directly over the outer row of caissons. All beams, except the two at the edges of the wharf, will be 15 inches thick and 3 feet 9 inches deep; the edge beams will be 14 inches thick and 3 feet deep. The main reinforcing in the middle of each beam will consist of 8 1-inch twisted bars, with stirrups of ⅜-inch twist placed about every 18 inches; and the track beams will have, as additional reinforcement at the juncture with the main girder, two 1¼-inch twisted bars, extending into the girder from each side, or four at each caisson.

Fourteen feet below the tops of the caissons, or four feet below mean sealevel, the caissons of the outer row are joined together with tie girders; and at the same elevation, a tie girder extends from the caisson across to its mate of the inner row. The tie girders are 2 feet deep and 22 inches thick and reinforced with eight 1-inch twisted rods, with ⅜-inch stirrups. Each caisson of the row next the land is anchored by means of a steel rod, 1¼ inches in diameter, extending about a hundred feet to a "dead man," buried 7½ feet underground. The "dead man" is of concrete, 7½ by 3 by 3½ feet in dimensions.

Five panels of the superstructure have been completed. The junctures of successive panels are made midway between main girders. The reinforcing rods for the beams extend continuously from girder to girder. Accordingly, for each panel the girder and the beams extending on either side are laid simultaneously as a solid mass of concrete. For each uniform panel, 102.4 cubic yards of concrete are used. The concrete is of cement, sand and rock in the proportion of 1:2:4. All the concrete for a panel is laid in one day from the ½-cubic yard portable mixer employed. A panel is laid every fourth day, the additional time being required for placing the forms and the reinforcing steel.



(A) JUNCTURE OF GIRDER WITH CAISSON.

The wharf is to be 656 feet long and 55 feet wide. Made wholly of reinforced concrete, it presents from below an imposing appearance of strength and stability, with a graceful Doric effect in the sweep of beams and girders.

Obituary.

George E. Newcomb, the father of H. S. Newcomb, an employe of the Panama Railroad Company, living in Colon, died in Colon Hospital on December 19. He was 69 years of age, married, and had been on the Isthmus one month, visiting his son.

The election of officers of the American Veterans of Foreign Service for the ensuing year will be held at a meeting on the evening of Saturday, December 30, in Ancon lodge hall. All members and those eligible to membership are invited to attend. A buffet lunch will be servied after the business meeting.

SOCIAL LIFE OF THE ZONE.

Meeting of Federation—Visit of Bishop Knight. —Christmas Benefits.

The date of the meeting of the Canal Zone Federation of Women's Clubs to be held in Cristobal in January has been set for the 27th. The federated clubs are requested to elect their delegates and alternates for the meeting, and to prepare such resolutions as they expect to bring before the Federation. Details of the arrangements, including information regarding transportation, will be announced later. Any club woman, not a member of a Zone club, but formerly, through her membership in an affiliated club, a member of the Federation, may receive an invitation to this meeting by sending her name to the corresponding secretary, Mrs. Thomas E. Brown, Jr., Cristobal. A supply of Federation pins has been received and these are in the hands of the treasurer and may be purchased by members of by those who have been members, upon presentation of credentials. This is probably the last supply of these pins that will be ordered and women wishing to secure this souvenir of club life in the Canal Zone are requested to place their orders before or at the January meeting. Communications regarding the pins may be addressed to Mrs. M. E. Smith, treasurer, Empire, Canal Zone.

The Rt. Rev. Albion W. Knight, D. D., Bishop of Cuba, will arrive on the Isthmus on Saturday, December 30, for his annual visitation to the Panama Mission of the Protestant Episcopal Church. This will be Bishop Knight's fourth visit to the Isthmus, he having been designated commissary of the presiding Bishop in 1907, at the time of the transfer of the Anglican Church to the jurisdiction of the Protestant Episcopal Church of America. Following is the itinerary that has been arranged for Bishop Knight's visit: Sunday, December 31, Christ Church By-The-Sea, Colon; Monday, January 1, St. Stephen's, Gatun; Tuesday, January 2, St. Mark's, Culebra, West Indian; Wednesday, January 3, St. Paul's, Panama; Friday, January 5, St. Augustine's, Paraiso; Saturday morning, January 6, St. Mark's, Culebra, conference of the clergy; Sunday, January 7, 7.45 a. m., St. Mark's, Culebra, ordination; 10.45 a. m., St. Mary's, Empire, consecration; 3 p. m., Ascension Church, Bas Obispo; 7.45 p. m., St. James', Empire, West Indian; Monday, January 8, St. Philip's, Las Cascadas; Tuesday, January 9, St. Andrew's, Gorgona; Thursday, January 11, St. Luke's Hospital Chapel, Ancon.

The residents of the village of Las Cascadas raised a fund for the Christmas dinner of the patients in the leper asylum at Palo Seco; with this money, which amounted to $50, a supply of turkeys, cranberries, vegetables, fruits, cakes, puddings, and candies was sent. The Canal Zone Federation of Women's Clubs sent a Christmas box to Palo Seco with a gift for each patient, in accordance with the custom established in 1909. The Altar Guild of St. Luke's Church, Ancon, presented gifts to various wards in Ancon Hospital, including the department for the insane. The Christmas committee for the relief of the convicts in the Canal Zone penitentiary sent a large donation of cakes, sweets, and other luxuries to the inmates of the Culebra peniteniary, and those at the stockade on Mandingo River. The Methodist Church in Panama supplied a Christmas tree and treat for the inmates of the Chiriqui prison in Panama.

CIVIL SERVICE RULES.

Concessions Made to Americans Employed on the Isthmus.

Americans employed by the Isthmian Canal Commission on the Isthmus who wished to secure employment in the Federal civil service in the United States have been handicapped since the enactment of a law, approved July 2, 1909, (36 Stat., 1) wherein it was provided that thereafter applicants for positions in the apportioned Departmental service would be examined by the Civil Service Commission only in the State or Territory in which such applicants claimed *bona fide* residence and that an applicant must be actually domiciled in such State or Territory for at least one year previous to the examination. The apportioned service includes practically all positions in the District of Columbia. Consequently, the effect of this law has been to exclude Americans on the Isthmus from the competitive examinations for positions in Washington. To minimize this handicap, which can be entirely removed only by action of Congress, the Civil Service Commission has recently agreed that an employe of the Isthmian Canal Commission who wishes to compete for a position in Washington may be examined in his home State during his annual vacation and that a special examination will be authorized if the regular examination is not scheduled to be held during the limited period of the applicant's leave of absence.

The Civil Service Commission has also stated that two registers shall be established for classified positions under the Isthmian Canal Commission, one to contain the names of qualified applicants on the Isthmus and the other the names of qualified applicants in the United States, and that certification will be made from the Isthmian register first and until that register is exhausted, unless certifaction from the second register is especially requested by the Isthmian Canal Commission. This should result in the early appointment of all local applicants who pass examinations and will make it relatively easy for any employe to acquire a classified status and thus become eligible for transfer to the classified service in the United States.

The above changes in the regulations were made on the recommendation of Mr. John A. McIlhenny, Civil Service Commissioner, who recently visited the Isthmus for the purpose of ascertaining what might properly be done to facilitate the transfer of employes on the Isthmus to other branches of the service as the work here is completed.

The following is the test of the ruling as recorded by the United States Civil Service Commission:

Examinations, Isthmus of Panama—Examination of Applicants on the Isthmus and in the United States—Preference in Certification.

Hereafter in examinations on the Isthmus of Panama, two eligible lists will be established; First, of those who are examined on the Isthmus; and certification will be made to fill vacancies on the Isthmus from this register first; Second, of those who are examined in the United States, and this register will be used only when the register on the Isthmus is exhausted, or upon request of the Chairman of the Isthmian Canal Commission.

Any person employed on the Isthmus of Panama in an unclassified status will be permitted to take an examination for the apportioned service in his home State at such time as he may be in such State on vacation. If any such person passes such examination his name will be entered upon the appropriate register, together with those examined in the open competitive examination of the same kind nearest in point of time to the date of his examination. To avail himself of the privilege hereby extended any such employe must duly file the necessary application with the Commission (Civil Service Commission), and in connection therewith establish domicile in the State claimed for at least one year immediately preceding, as required by the statute; but his Federal employment on the Isthmus will be held not to vitiate his claim to domicile in the State in which he was actually domiciled immediately preceding such employment on the Isthmus.

This action amplified minute 17 of July 16, 1909.

In connection with the second sentence in the second paragraph, it is to be noted that the term of eligibility of applicants qualifying under the above terms is to be coincident and coextensive as to time with other eligibles from the examination with the papers of which those of the Isthmian eligibles will be consolidated.

As the above notice is given in explanation of the foregoing ruling, which ruling is stated in full, persons interested should be certain that any possible inquiry is not answered above before writing this office for information, as the ruling and explanation above set forth will form the basis of replies to inquiries.

John K. Baxter,
Secretary, Isthmian Civil Service Board.
Culebra, C. Z., December 23, 1911.

Civil Service Examinations

An examination will be held about the last week in January for stenographer and typewriter in the Isthmian Canal and Philippine services and for typewriter in the Isthmian Canal service. In requesting information and application blanks for any of the above the name of the examination desired should be stated.

☞ No one should report for examination before ascertaining the exact date on which the examination will be held.

John K. Baxter.
Secretary, Isthmian Civil Service Board.
Culebra, C. Z., December 23, 1911.

Pilots, Masters, Mates, Engineers, Chauffeurs.

Examinations for pilots, mates, masters, and engineers; and for chauffeurs, will be held by the Board of Local Inspectors at the Administration Building, Ancon, on January 3, 1912. All applicants for licenses as chauffeur must secure from the Department of Civil Administration, Executive Office, Ancon, forms of application, and information respecting the filling out of the same, not later than the day previous to the examination. All applicants for examination must be present at the Administration Building at 8.00 a. m., on January 3, with papers in proper form. In addition, applicants for chauffeurs' licenses must demonstrate their capacity properly to operate an automobile, and must have the automobile with them.

PERSONAL.

Attorney General Wickersham, and Mrs. Wickersham, The Ambassador of France to the United States, J. J. Jusserand, and Madame Jusserand, and the Minister from the Netherlands to the United States. J. J. Loudon, and Mrs. Loudon are passengers on the *Atenas* due to arrive at Colon on December 28.

The Congressional party, comprising members of the Interstate and Foreign Commerce Committee of the House of Representatives, sailed for the United States on the *Cristobal* on December 24.

Maj. G. M. Hoffman, accompanied by his wife and family, returned to the Isthmus on the *Panama* on December 20.

LOCK MACHINERY.

Storage Installation—Miter Gate Machines.

Storage room for the lock machinery, between the time of its arrival on the Isthmus and when it is set in the lock walls, will be provided in the cement shed at Gatun for the locks at that place, and in the old machine shop at Paraiso for the locks at Pedro Miguel and Miraflores.

At Gatun the six south bays of the cement storage shed, each 50 feet wide and 110 feet long, will be used. Each of these bays was fitted with an overhead crane for handling cement from barges into the storage shed, but two of the cranes have been taken out, and in these bays only such material as can be handled by hand will be stored. In the other four bays the handling will be done by crane. A spur track has been built into the south end of the cement shed from the toe of the dam, and over this trains with the machinery will run into the shed, where the overhead cranes will unload them.

At Paraiso the two cranes taken from the cement shed at Gatun will be installed, after they have been cut down at Gorgona shops to 37 feet 8 inches and 27 feet respectively. The bays in which these cranes will operate are 27 by 135 feet and 38 by 160 feet. Here, as at Gatun, only heavy parcels will be stored in the crane bays, the man-size packages being stored where they will be handled by hand.

In all there will be 30,000 tons of machinery and parts to store over a period of 18 months. When the quantity in storage is greatest it is estimated that 103,000 square feet of space will be required, and the average will be 80,000 square feet. About half the material will be required at Gatun, half at the Pacific locks.

The first of the Stoney gate valve machines to complete test in the United States has arrived on the Isthmus and is being erected in the west wall of the upper locks at Gatun. The first of the Stoney gate valves, which will control the flow of water through the main culverts of the locks, will arrive early in February.

One of the cylindrical valves, which control the flow of water from the main culvert of the center wall into the lateral culverts beneath the lock floor, together with the machine for operating it, has been set in the center wall of the upper locks at Gatun. It will control one of the culverts for the west lock.

The first of the miter gate moving machines was tested at the plant of the contractor, The William Tod Company, Youngstown, Ohio, on December 2, and found satisfactory. In accordance with the terms of the provisional award under which 2 machines were contracted for, the award for 90 additional machines will now be made, the total cost being about $652,000.

The machine in this contract was described in The Canal Record of April 26, 1911. It consists essentially of a crank or "bull wheel" to which is fastened one end of a strut or connecting rod, which at the other end is fastened to the lock gate. The bull wheel is mounted in a horizontal position in the lock wall. It has gear teeth on its rim and is driven by a single pinion on a vertical shaft, gear connected with a motor. The wheel, moved through an arc of 197 degrees, closes or opens the gate, according to the direction in which it is turned, the movement being that of a hand reached out to open or close an ordinary gate. Two minutes are required for one complete operation.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

STATISTICAL REPORT FOR NOVEMBER.

The membership of the clubhouses has shown an increase during the year, and the social activities have greatly increased. The following statement shows conditions during the month of November:

Total membership	1,960
Total number bowling games	9,543
Average per day	363
Total number pool and billiard games	26,182
Average per day	1,007
Number tournaments in progress	21
Number of tournament players	305
Total income from soda fountain	$3,697.29
Average per day	$123.24
Number different men using gymnasiums	557
Total number of men using gymasiums	1,240
Average per day	48
Number enrolled in chess and checker clubs	82
Number enrolled in glee clubs	79
Number enrolled in dramatic and minstrel clubs	50
Number enrolled in camera clubs	51
Number enrolled in orchestras	6
Number enrolled in Bible clubs	131
Number enrolled in educational classes	42
Number members of libraries	1,031
Total number of books withdrawn	3,404
Number of religious meetings	12
Number religious meetings and debates	12
Average attendance	63
Number of lectures	13
Average attendance	56
Number imported entertainments	3
Average attendance	217
Number of local entertainments	37
Average attendance	221
Number functions outside association management	20
Average attendance	102
Number afternoons for women	34
Average attendance	4
Number evening functions to which women invited	53
Average attendance of women	67
Number of committees	43
Different men on committees	224
Number of men called on in hospitals	433
Number of letters written at public tables	7,500
Average per day	260
Total attendance at building	76,345
Average per day	2,527
Number of beds used during the month	392

BOYS' DEPARTMENT.

Number of members	127
Number of afternoons for boys	101
Average attendance	13
Total attendance in systematic gymnasium work	237
Outings	6

GENERAL.

The following is the schedule for moving picture shows for the week of January 1 to 6: Monday, Gatun; Tuesday, Cristobal; Wednesday, Gorgona; Thursday, Empire; Friday, Corozal; Saturday, Culebra.

The final standing of teams in the Isthmian Basket Ball League for the season ending December 23, 1911 follows:

Team.	Won.	Lost.	P.
Cristobal	10	0	1.000
Gatun	7	3	.700
Gorgona	6	4	.600
Culebra	5	5	.500
Corozal	1	9	.100
Empire	1	9	.100

The result of games in the week ending December 23, follows: December 15, Gorgona, 2, Empire, 0 (forfeit); December 16, Gatun, 34, Corozal, 14; December 23 Gorgona, 22, Culebra, 20; Cristobal, 2, Corozal, 0 (forfeit).

COROZAL.

The Handicap pool tournament closed December 20. Lofgren was the winner and will receive a gold medal. Baker and Roberts tied for second place.

Dr. Orenstein delivered a lecture on Sex Hygiene last Wednesday night. About 50 men attended the lecture

Two hundred people attended the Sunday school Christmas Entertainment given at the clubhouse on Saturday night.

"Open house" was observed at the clubhouse on Christmas night. Music was furnished by the Guatemalan Quintet.

CULEBRA.

The basket ball game between Gorgona and Culebra on Tuesday evening was won by the former with a score of 22 to 20 Following is the line-up:

Culebra.	Gorgona.
Cushing	Stevens
Van Zandt	Lauder
Hepler	Swanson
Barcroft	Earle
Stillwell	Carpenter

The volley ball game on Wednesday evening between the Christian League team and the Assistant Chief Engineers was won by the latter with a score of 3 to 1.

All men interested in the field meet to be held at Empire on Washington's Birthday should come out for practice on Monday and Friday evenings.

The tie for billiard tournament between Dubois and Tragsdorf was played off on Monday evening, the latter winning. This gives Mr. Tragsdorf first place and Dubois second.

EMPIRE.

The following high scores were bowled on the alleys during the past week: Duck pins—Rodeghiero, 101, 1908, 110, 106; Reed, 119, 109; Pinney, 101; Davis, 111; Goolsby, 100, 105; N. Giavelli, 107, 100; Swallow, 114; Payne, 112.

A plan is under consideration for the organization of a Spanish class in the near future. Any one desiring to attend will please leave his name at the desk as soon as possible.

The Christmas entertainment held at the clubhouse on Saturday, December 23, was attended by 700 people. Two hundred and fifty children received gifts. The program was by the children. Refreshments were served, consisting of turkey sandwiches, home made cakes and coffee. An orchestra from the Tenth Infantry furnished music.

Plans have been completed for a minstrel show in the near future. The following officers have been elected. Don E. Irwin, director; E. P. Sine, stage manager; W. R. Evans, jr., secretary.

GORGONA.

At the Christmas celebration at the clubhouse on the night of December 23, stockings were hung upon several brilliantly decorated trees, a stocking full of candy, nuts, and fruit for each child present. The trees also bore other presents. There was a short program by the children. Four hundred and twenty five persons were present.

A concert by the Tenth Infantry Band has been arranged for New Year's Night for all the people of Gorgona.

A return performance of the Gorgona Minstrels will be given on Friday night, December 29. Seats were on sale on Tuesday the 26th.

Indoor baseball practice will be held on Thursday night, December 28. After January, the regular baseball night will be Wednesday. Monday night will be devoted to Volley Ball, and Friday night will be turned over for indoor track work in preparation for the "telephone meet" the middle of January, and the indoor meet in Gatun early in February.

GATUN.

G. K. Weston of Cristobal sang several popular songs at the moving picture entertainment on Wednesday, December 20. The songs were illustrated with colored stereoptican slides. Miss Eva Harris acted as accompanist.

The Gatun clubhouse is appropriately decorated for the holiday season. The color scheme is green and red. Among the decorations are about 30 Christmas trees distributed throughout the building, red and green Christmas bells, red and green electric lights, colored paper, and in the center of the lobby a representation of Santa Claus.

The Y. M. C. A. choral club is planning to give a concert in about a month's time. Among the members are: Sopranos: Miss Harris, Mrs. Hughs, Mrs. Hastings, Mrs. Bath, Miss A. Clark, Mrs. N. Johnson, Miss Tease, Miss Neville, Miss Mary Clark, Miss Kimball, Mrs. Harris, Miss Stevenson; Altos: Miss Hanna, Mrs. Windes, Miss Adams, Miss Sessions, Mrs. Housel; Tenors: Messrs. Coleman, Shailer, Messina, Langston, Perkins, Lloyd, Arthur, Parker; Basses: Messrs. Ruckert, Carr, C. Dewey, Wm. Dewey, Ourand, Fitzgerald, Rohr, Young, F. Smith, Kitts. Mr. A. B. Dickson acts as director.

The Tenth Infantry Regimental band of 30 pieces will give a concert on Thursday evening, December 28, at the clubhouse. The program will be as follows: March, "National Emblem," Bagley; Fantasia, "Echoes from the Metropolitan Opera House," arranged by Moses; Serenade, "La Paloma," Yradier; Waltz, "Blue Danube," Strauss; Southern plantation songs, arranged by Boetzer; Nisaic, Quartette from "Rigioletto," Verdi, Intermezzo, "Isis," Morse; Selection, "Girl of My Dreams," Hoschna; Popular melange, arranged by Alford; "Star Spangled Banner."

CRISTOBAL.

The Christmas Entertainment for the white people of Cristobal was held on Saturday evening, December 23. The program consisted of a play by the children, under the supervision of Mrs. L. J. Hart, Mrs. James Perkins and Mrs. Bronson. There was an attendance of 368. The hall was decorated with two large Christmas trees, palms and Japanese lanterns. Four hundred and fifty boxes of candy and a barrel of apples were distributed during the evening. The program opened at 7 o'clock, closing at 8, in order that the bachelors' program could begin at nine. The men's entertainment began at 9 o'clock with an audience of 207, and consisted of a minstrel sketch by Messrs. Emery, Cogan and Loughery from Gorgona. Refreshments were served consisting of turkey, cheese and ham sandwiches, coffee, cigars, apples, ice cream and candy, and home made cake.

At the regular meeting of the Literary and Debating Club on Wednesday evening, December 20, the following officers were elected for the ensuing term; C. J. Dinnin, president; G. K. Weston, vice-president; C. A. Burrows, secretary. H. J. Wempe was appointed chairman of the entertainment and program committee.

The following high scores were made on the local bowling alleys during the week ending December 23: Ten pins—Louch, 213, 237, 201; Herring, 207; Collins, 204, 206, 213, 200, 223, 213, 225; Bullard, 213, 204, 201; Rabbitt, 210, 231, 204. Candle pins—Herring, 105; Barrett, 120, 106; Louch, 102, 106; Collins, 106; Grover, 107, 102. Duck pins—Herring, 107; Louch, 109, 100; Smith, 107; Orr, E., 105; Marquez, 107, 104, 105, 101; Cotton, C., 101; Barrett, 113, 104, 108, 101; Barte, 107; Schofield, 101; Herrington, 108; Claherty, C., 103; Claherty, P., 108; Farrell, A., 110.

Sale of Public Building.

OFFICE OF THE CHIEF QUARTERMASTER,
CULEBRA, C. Z., December 22, 1911.

Sealed proposals will be received at this office until 3 p. m. Friday, January 5, 1912, and then opened for the purchase of building No. 13, located at San Pablo. Successful bidder will be required to remove building within thirty (30) days from date of sale, and will be granted the Commission freight rate over the Panama Railroad for material recovered from same. Proposals should be accompanied by certified check, post office money order, or cash for 5 per cent of amount bid. The Government reserves the right to reject any or all bids. Envelopes containing proposals should be endorsed "Proposal for Purchase of Building" and addressed to Colonel C. A. DEVOL, *Chief Quartermaster.*

Auction of Unclaimed Shipments.

PANAMA RAILROAD COMPANY,
OFFICE OF GENERAL SUPERINTENDENT,
COLON, R. P., December 8, 1911.

In order to recover freight and storage charges, the Panama Railroad will dispose of the accumulation of Over and Unclaimed Shipments now in its possession, by public auction, commencing Wednesday, January 10, 1912, at 9.30 a. m.; sale to be held on Dock No. 11, Cristobal, C. Z.

The items to be sold consist of a miscellaneous assortment of wines, liquors, household goods, building material, stationery, groceries, dry goods, machinery, and merchandise in general, all of which has been held six months and over in an effort to locate owner.

J. A. SMITH, *General Superintendent.*

OFFICIAL CIRCULARS.

Classified Expenditure Accounts.

EMPIRE, C. Z., December 22, 1911.

CIRCULAR No. 34:

Effective with the accounts for November 1911, the following classified expenditure accounts have been authorized by the Chairman and Chief Engineer:

502—Atlantic Seacoast Batteries.

A—Construction.

To this account will be charged all labor, material and other expenses incidental to the construction of seacoast batteries on the Atalntic side of the Canal Zone.

B—Plant.

To this account will be charged all plant heretofore or hereafter purchased for the work of constructing the seacoast batteries on the Atlantic side; and credited with plant transferred to other divisions where original purchase was made from fortification funds.

503—Pacific Seacoast Batteries.

A—Construction.

To this account will be charged all labor, material and other expenses incidental to the construction of seacoast batteries on the Pacific side of the Canal Zone.

B—Plant.

To this account will be charged all plant heretofore or hereafter purchased for the work of constructing the seacoast batteries on the Pacific side; and credited with plant transferred to other divisions where original purchase was made from fortification funds.

Expenditure account 502, Seacoast Batteries, as authorized in Circular 33 is abolished and the charges thereunder will be rewritten under the accounts authorized above.

H. A. A. SMITH,
Examiner of Accounts.

Removal of French Scrap.

CULEBRA, C. Z., December 23, 1911.

CIRCULAR No. 426:

Hereafter no French scrap of any description will be loaded by anyone without direct instructions from the Chief Quartermaster.

In case it becomes necessary, for construction purposes, to remove this material, the Chief Quartermasters written instructions shall first be secured.

The French scrap made in the shops from repairing equipment now in the use will be kept separate from other scrap, and no shipments made unless directed by the Chief Quartermaster.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Half-Rate Mileage Books.

CULEBRA, C. Z., December 18, 1911.

CIRCULAR No. 420-A:

1. Effective January 1, 1912, the issuance of half-rate requests for trip tickets will be discontinued.

2. The Panama Railroad Company will, on or about December 22, place on sale with all ticket agents first-class half-rate mileage books, which will be sold to employes of the United States Government and the Panama Railroad for $5.00 and $10.00 each for 200-mile and 400-mile books respectively.

3. These books can be purchased only by the presentation of a validated request, Form No. C. E. 319.

4. The employes desiring to purchase a mileage book will fill out two copies of this request, which will be forwarded direct to the Chief Clerk, Chairman's Office, Culebra, if employed by the Commission, the Commissary Department or the P. R. R. Relocation; and direct to the Chief Clerk, General Superintendent's Office, Colon, if employed by the Panama Railroad Company. After being checked and validated, a copy of the request will be returned to the employe and will be his authority to purchase a mileage book.

5. Blank forms of the request for mileage books will be distributed to the department and division offices and the timekeeping offices, so that they will be easily obtainable by any employe desiring them.

6. Unnused mileage remaining in a book upon which the time limit has expired, or at the employe's termination of service, will be redeemed on presentation to the Local Auditor of the P. R. R.

7. These books will be issued only to employes on the gold roll and for only first-class transportation.

8. The number of $10.00 books issued for use of an employe and his family is not limited, but not more than one $5.00 book will be issued to an employe within any calendar month.

9. The books will be good for the use of the employe and any member of his family residing with him. The members of his family who will use the book must be indicated on the request in the space provided for that purpose.

10. The attention of employes is directed to the fact that the sale or transfer of the half-rate privilege to another constitutes a misdemeanor according to decisions of the Canal Zone Courts, which is punishable by a fine or imprisonment, or both, and in addition they may be punished by dismissal from the service.

11. Employes purchasing books are required to sign with ink the contract on the book's cover.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending January 3, 1912, (75th meridian time):

Supplies for Canal Work.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon, and Balboa, during the week ending December 16:

Acapulco, December 9, from San Francisco, with 19 bales dredging sleeves, for Atlantic Division.

Konsas City, December 10, from San Francisco, with 100 coils manila rope, for stock.

Alcona, December 11, from Baltimore, with 30 crates castings, 560 pieces lock material, 110 cases lock material, 14 bundles lock material, 2,793 pieces steel ties, 187 bundles rack railway material, 122 pieces rack railway material, for Atlantic Division; 300 bundles rack railway material, 186 pieces rack railway material, for Pacific Division; 482 pieces white oak lumber, 297 pieces car couplers, 131 pieces knuckles, for Mechanical Division; 1,720 pieces steel plates, 200 kegs rivets, for Panama Railroad Company; 3,259 bundles splice bars, 465 bundles steel bars, 3,287 pieces steel bars, angles, etc., 333 bundles galvanized roofing, 15 bundles padboard, 189 tons blacksmith coal, for stock.

Indianapolis, December 14, from Savannah, with 30,871 pieces cross ties, for stock.

Zocapa, December 14, from New York, with 35 cases window glass, 21 cases fuse, for stock.

Turriolba, December 14, from New Orleans, with 26 bundles castings, 24 pieces castings, 75 cases brass bolts or Atlantic Division; 123 cases brass bolts, for Pacific Division; 543 pieces creosoted ties, for Panama Railroad Company; 107 pieces white oak lumber, 156 pieces yellow pine lumber, for Mechanical Division; 7,422 pieces yellow pine lumber, 162 pieces piling, 123 barrels fire clay, 315 sacks dairy feed, 9 crates stoves and parts, 10 barrels galvanized clips, 56 pieces steam shovel castings, for stock.

Advance, December 14, from New York, with 25 cases rubber boots, 5 cases electrical material, 6 reels steel cables, for Atlantic Division; 25 cases rubber boots, 223 bundles steel bars, for Pacific Division; 29 cases drugs and sundries, for Sanitary Department; 93 cases window frames, for Panama Railroad Company; 18 cases rubber packing, 12 reels steel cables, 1,000 kegs bolts, 100 cases liquid exterminator, 13 cases meat blocks, 14 cases rubber hose, 100 cases oxide of zinc, 12 cases car seals, 17 drums lime, 72 kegs nails, 1,082 bags coke, 10 barrels lard oil, 34 cases castings, 20 cases wool waste, for stock; and a miscellaneous cargo, the whole consisting of 3,000 packages weighing 264 tons.

The following ships arrived at, or departed from the port of Balboa during the two weeks ending December 23:

Arrivals—December 11, *Guotemala*, from Callao; December 12, *Mantoro*, from Callao; December 14, *Chile*, from Guayaquil.

Departures—December 11, *Pennsylvania*, to San Francisco; December 11, *Pachitea*, to Callao; December 12, *Riverside*, to San Francisco; December 13, *Palena*, to Valparaiso; December 16, *Mantaro*, to Callao.

Arrivals—December 17, *Tricolor*, from North; December 17, *Monavi*, from Buenaventura; December 18, *Mango Revo*, from San Francisco; December 18, *Ucuyali*, from Callao; December 20, *Aysen*, from Valparaiso; December 21, *Pleiades*, from San Francisco.

Departures—December 18, *Guatemala*, to Callao; December 18, *Quito*, to Guayaquil; December 19, *Acapulco*, to San Francisco; December 19, *Chile* to Guayaquil; December 19, *Konsos City*, to San Francisco; December 20, *Bobcock*, to San Francisco; December 21, *Mackinaw*, to San Francisco; December 23, *Monovi*, to Buenaventura.

MOVEMENT OF OCEAN VESSELS.

The following is a list of the sailings of the Panama Railroad Steamship Company; of the Royal Mail Steam Packet Company; of the Hamburg-American Line, and of the United Fruit Company's Line.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Eitel Friedrich* call at Santiago de Cuba, on both outward and homeward voyages. The *Altai* cabins are all sold at second cabin rates.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a. m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct leave on Thursdays at 3 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, JANUARY 3, 1912. No. 19.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents.

THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

The Dredge Culebra.

The sea-going suction dredge *Culebra* is on the ways at the Balboa yards for repairs, which will consist mainly of general overhauling. This is the first time the *Culebra* has been under general repairs since February, 1910. It was commissioned January 21, 1908. The *Caribbean*, a sister ship of the *Culebra*, has been excavating in the Atlantic entrance to the Canal. These dredges were bought from the Maryland Steel Co., Sparrows Point, Md., in 1907. Since the beginning of its service the *Culebra* has excavated 13,195,388 cubic yards of silt and clay. Its highest monthly record—522,577 cubic yards—was made in the month of March, 1908. Its normal crew consists of 69 men.

Excavation at San Pablo.

On January 2 a steamshovel began work east of the Panama railroad track at San Pablo on a mound of earth that rises in the Canal prism at this point. A shovel has been clearing the bottom of the channel at this point for several weeks, but this is the first excavation on the hill which must be removed before the Canal is completed in this section.

Completion of Hydraulic Fill for Miraflores Dam.

The hydraulic fill for the core of the west dam at Miraflores has been completed, and while the water is draining from the silt through a sluice at the north end of the dam, earth and rock are being dumped on the sides of the mass, closing in toward the center. The height of the hydraulic fill is now at elevation +59; the dumping of heavy material on the sides will force it higher and the top of the dam will be 70 feet above sealevel, or 15 feet above the normal surface of Miraflores Lake. The average head to which the dam will be subjected is 30 feet, the maximum, 40 feet.

Water Supply in Central Section.

An increase in the population of the section served by the Comacho reservoir water system, and a probable shortage in the amount of water stored on account of the early beginning of the dry season, have made it necessary to provide for pumping water from the Chagres River to supplement the reservoir supply. Two 3-stage 8-inch centrifugal pumps will be mounted on the south channel pier of the railroad bridge at Gamboa and will pump into the main at that point. These pumps are rated to deliver the equivalent of 1,500 gallons of water per minute each against a head of 150 pounds. They would therefore be capable of delivering over 3,000,000 gallons a day, but it is probable that only one of them will be in service at a time, except in emergencies.

The territory served from the Comacho system extends from Bas Obispo to West Culebra, inclusive, and includes besides 3 villages, the Marine camp, the camp of the 10th Infantry, a part of Culebra Cut with its steamshovels and locomotives, and the dumps on the relocation of the Panama railroad north of Gamboa. Last year the average consumption was two million gallons a day from the reservoir, and in addition, about 1,500,000 gallons, pumped into the mains by the small pumps at Bas Obispo on the Madingo River, LaPita and Lirio on the Obispo River, a station on the Chagres at Gamboa, and one on the Camacho River below the reservoir.

At present the daily consumption runs about 2,500,000 gallons from the Camacho Reservoir and pumping station. Camacho Reservoir has a capacity of 313,367,000 gallons, and at the close of December it was about 88,000,000 gallons short of the supply stored at that time last year. The flow of water into the reservoir is so small at present that it does not make up for the evaporation. The water from the Chagres comes from a region little inhabited and is sufficiently pure to be used for drinking. Drinking water is supplied in the various canal villages, however, from the condensing plants. Mandingo River water, potable last year, is no longer considered safe, on account of the increase in the number of inhabitants along the course, including the penitentiary prisoners at the Mandingo stockade.

Swamp Reclamation.

The reclamation of swamp lands between the Canal channel and the Panama railroad, from Miraflores to Corozal, is proceeding from the north. The lowlands are being raised by means of silt pumped from the hydraulic excavation south of Miraflores Locks and in order to preserve the diversion channel of the Rio Grande and the drainage facilities, dikes are built where necessary. About two hundred yards north of Corozal Junction a dike has been built between the Pacific Division tracks and a knoll, which extends to the east bank of the Rio Grande diversion, along the bank of which a bulkhead prevents the silt from escaping into the stream. Since the discontinuance of hydraulic filling in Miraflores Dam, all the spoil from the excavation by monitors will be used for swamp reclamation, which will advance more rapidly.

Clearing the Anchorage Basin at Gatun.

About February 16 the Central Division will set two steamshovels at work removing the embankment upon which the present line of the Panama railroad crosses the Gatun River bottom at Gatun. This embankment was made to carry the relocation of the railroad before the present relocation was determined upon, and has been used since then as the means of joining the new railway line with the old from Gatun to Tiger Hill, in which section the old line was covered by Gatun Dam. The embankment is about 1¼ miles long, and it cuts in two parts the anchorage basin at the south end of Gatun Locks, and therefore must be removed.

New Clamps for All Steamshovels.

The foundry at the Gorgona Shops is preparing to cast fifty more of the steel rail clamps for steamshovels, which were invented by W. H. Bates, Superintendent of Steamshovel Repairs, and adopted after a six months' trial. Upon adoption it was ordered that 350 be put in use; the additional clamps now to be cast will be sufficient to equip the remainder of the steamshovels in service. A description of the clamp was published in THE CANAL RECORD for November 1, 1911.

Dredges in Atlantic Approach Channel.

The 18-inch suction dredge *No. 4* was taken from the dry dock at Mount Hope during last week and placed at work in the approach channel between Mindi and Gatun Locks, in place of the 20-inch suction dredge *Sandpiper*, which was withdrawn for repairs at the dry dock. When repaired, the *Sandpiper* will return to work alongside *No. 4*. The latter, which was commissioned on August 15, 1910, was engaged until November 16, 1911, in excavating sand at Nombre de Dios for the Atlantic Division.

Transfer of Compressors.

In the transfer of air compressors from the plant at Las Cascadas to the Agua Dulce hydraulic station, south of Miraflores Locks, one compressor has been installed on a concrete foundation just north of the power house, which will be extended to cover it. The installation of the second is now under way. Boilers for the compressors will be placed directly back of them. Investigation has shown that it will be practicable to operate them under pressure of 150 pounds to the square inch, which makes it necessary to move only two boilers instead of three.

Rack Track Installation.

The first consignment of towing track, consisting of sixty sections of rack track, each six feet in length, has arrived at Gatun locks. Delivery will continue from January 1, 1912,

NOTES OF PROGRESS.

(Continued.)

at the rate of 240 sections each week, which will complete final deliveries for all three sets of locks by October 1, 1912. Installation of the rack track has been started in the east side wall.

At each set of locks the towing system consists of seven lines of track, all running the entire length of the locks. Four tracks, two for the center wall and one for each side wall, are for towing and are equipped with a rack. Three racks, one for each of the walls, are used to return the locomotives when not towing a ship. Each of the tracks is constructed of a pair of ninety-pound rails bolted to Carnegie steel ties. The ties for towing tracks are spaced upon 3-foot centers, and the ties for the return track have 3-foot 9-inch centers. The towing tracks and the return track at the inclines are, in addition, equipped with a cast steel rack, the rails alone not developing sufficient tractive effort. The rack is located upon the centerline between rails and projects seven inches above the top of the rails. All tracks are equipped with conductor rails on the off-tow side of the track.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 74 per cent completed, 166,713 cubic yards, out of a total of 225,000, having been placed at the close of work on December 30. A statement of the amount laid each working day last week, and of the total in place, follows;

Date.	Concrete Laid.	Hours worked.	No. Mixers.
December 25			
December 26	32	1.45	1
December 27	120	9.00	2
December 28	200	11.45	2
December 29	148	13.00	2
December 30	264	16.00	2
Total	764	51.30	1.8
Previously reported	165,949		
Grand total	166,713		

Ancon Crusher.

Porto Bello Crusher.

Date.	Hours worked.	Cubic Yards.
December 26	3.09	1,485
December 27	4.06	1,863
December 28	4.08	1,871
December 29	3.37	1,800
December 30	3.46	1,740
Total	18.46	8,759

Red Cross General Meeting.

A public reception will be given by the Canal Zone Chapter, National Red Cross, to Miss Mabel T. Boardman, Chairman of the Executive Committee of the National Red Cross, who is about to visit the Isthmus. It will be held in the National Theater at Panama at 8.30 o'clock in the evening of January 13. Addresses will be delivered by Col. Geo. W. Goethals and Miss Boardman.

Members of the Red Cross may obtain tickets of admission from the local Red Cross chairmen, district quartermasters, Y. M. C. A. secretaries, or from the Chairman or Secretary of the Red Cross at Culebra. The President of Panama, and his cabinet, members of the diplomatic corps and prominent officials of the Republic and the Canal Zone will be invited.

Extra cars on the Saturday night trains from Colon to Panama will be reserved for persons attending the lecture. The fare of $1.00 will include membership in the Red Cross for the ensuing year, admission to the theater, and transportation both ways.

CONCRETE WORK IN THE LOCKS.

Over 75 per cent of the concrete for the locks is in place, the amount at the close of work on December 30, being 3,149,865½, cubic yards, out of a total of approximately 4,199,400. A total of 21,138½ cubic yards of concrete was laid in the locks during the week ending December 30.

GATUN LOCKS.

Over 88 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on December 30 being 1,765,482½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending December 30, and of the total, follows; and a similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers.			Large stone.	Total.

IN PLACE OF THEATERS.

How Canal Workers Amuse Themselves During the Theater Season.

THE CANAL RECORD:

As the Canal work draws towards a close and it becomes evident to even the casual observer that the problems of engineering and construction have been solved, interest in social conditions increases, and the paragraphs here written are an answer to one of the questions frequently asked—"what is there to take the place of the theater?" Unfortunately no data are available, either here or in the United States, to enable a comparison to be made; but it is the opinion of careful observers that the American Canal workers have as many breaks, and on the average of as good quality, in the routine of their lives as they had in the villages and cities in the United States which they left to come to Panama.

In the foreground a stretch of barren rolling plain, blue in the distance mountains fret the sky, such a view as one gets in those Western states where the prairies meet the hills; from behind a knoll trots a cavalcade of pioneers and trailing behind them is a "prairie schooner." There is a sudden halt, a woman gesticulates wildly, and the horsemen put about on a gallop. Scene follows scene, and in the sum of them everyone knows that a baby has been lost from the wagon, found by an indian, rescued by the pioneers, stolen by the indians, and again rescued after much effort and the killing of ever so many red men, not all killed at one time, either, but picked off, one by one, so that the boys in the front seats may applaud each rightful death.

A little pause, and a beggar comes into a toy store, steals a toy and runs. He is followed by the storekeeper, two clerks, several policemen, and a large crowd. Running, the thief meets a man on a bicycle, knocks him off, speeds away, still followed by the police. He meets a man with an aeroplane, runs into the machine and sails off into the air, just as his capture is almost certain. Above the tops of tall buildings, higher that the church steeples, he sails along, while the police try to bring him to earth with revolver, rifle and cannon shots, but unsuccessfully. Then a small boy with a popgun takes careless aim and the thief falls to earth.

Another pause, and one sees the telegraph office where the handsome man is teaching the daughter of the general manager how to send a message. In the course of six scenes the knowledge the beautiful daughter gains of the telegraph code makes it possible for the handsome man (now garbed in opera hat and cloak) to rescue her and her stern father from the office safe in which they have been imprisoned.

These and other similar comedies were enacted in six Canal Zone settlements on as many different nights last week. Two generations distant from the days of prairie schooners, two thousand miles away from an aeroplane, and the nearest opera cloak probably in New Orleans, the Canal workers saw and enjoyed these crucial situations in a dozen lives. At Empire and Cristobal the slaughter of indians caused greatest applause, at Gorgona the spectators sympathized most with the beggar balking the police, and at Culebra, Corozal, and Gatun there was a distinct leaning toward the romance of the girl and the telegrapher. A very matter of fact young man ground out these short stories by turning the crank of a moving picture machine at the Commission clubhouses, while in each village a crowd, larger than the hall could seat, (between two and three hundred) watched every move in the multiple drama. Each week, in each of the villages mentioned, this same machine grinds out as many stories, each week a new series, and each time there are indians or such like to please the children of all ages, a heart romance for the sentimental and laughable situations for those who appreciate the ludicrous.

As a concession to the popular demand for ballads and rag-time songs the clubhouse management has this week begun a series of illustrated song entertainments to be a part of the moving picture shows. The machine will grind out a series of scenes illustrative of a song and some local singer will sing the words. The scope of these song scenes is broad, and it is the intention not to confine them to the cheap ballads.

The first entertainment attempted by the American Canal workers was a minstrel show at the old Sara Bernhardt theater in Panama in October, 1905. It followed the lines of the conventional minstrel show, with jokes vamped over to fit local conditions or to refer to prominent or popular Canal employes. A more elaborate entertainment of this class was the "show" by the Culebra Minstrels on November 8, 1907, at the newly finished clubhouse in Culebra. In the audience were prominent Canal officials and members of a Congressional party that was visiting the Isthmus. THE CANAL RECORD of November 13, 1907 contains an account of this entertainment. In the issues that have been published since then, each of the entertainments of this class by regularly organized bodies of Canal workers has been noted. Each year since 1907 there has been a minstrel troupe which has given entertainments at the Commission clubhouses. Other entertainments of a vaudeville character have also been held, usually for some special purpose, such as procuring money for a church or other organization. This year the Gorgona Minstrels have just completed a successful season, and the Empire Minstrels are preparing to give a series of entertainments. The appeal of these "shows" to the Canal workers is that they introduce a number of local jokes, or old jokes devoted to local use.

Plays have not been so popular as minstrel shows, probably because the local features are lacking, and that it is necessary to act plays that many of the Canal workers have seen presented by professional actors. Then, too, there is the amateur's dread of being laughed at, and the inability of the spectator to enter into the illusion of a play in which the actors are known to him. It is easy to turn a scene intended to be solemn into a ludicrous one. In a comedy acted two years ago it was the part of one of the characters to offer twenty-five thousand dollars to save his beloved but erring nephew from prison. Now the actor was known in his home town on the Canal Zone as one who had little money, and his generous offer therefore caused a smile. Yet when the play was presented in other villages, this part impressed no one as ludicrous. Among the more noteworthy dramatic efforts by Canal builders are "Captain Racket," which was played by the Gorgona Dramatic Club in several Canal Zone villages and ended its season with a benefit performance for The Red Cross at the National Theater in Panama on Labor Day, 1909. It was estimated that three thousand people out of a possible 8,000 saw the play in all its performances. On August 20, 1910 the Ancon Dramatic Club played "The Private Secretary" at the National Theater in Panama for the benefit of the organ fund of St. Luke's Church, Ancon; and a few months later played "Lady Windermer's Fan."

An opportunity for amateur theatricals that has not been availed of is that afforded by the brilliant moonlight nights of the dry season for outdoor performances. In every village there is a hillside capable of being turned into an amphitheatre at little expense. The objection of "red bugs" is not valid since the ticks do not interfere with golf at Culebra and baseball at other places.

Last year a choral society was organized at Empire and rendered effectively several oratorios. This year a similar society is practising at Gatun, and a glee club is being rounded into shape at Culebra, for a tour of tht Canal villages.

All of these entertainments are held in the Commission clubhouses, where there is a large hall with a stage at one end. Here moving pictures are exhibited, and the annual Christmas exercises, concerts, semi-monthly dances, plays, and Sunday evening religious exercises are held. There is nothing incongruous in this, because the most active entertainers in each community are alike earnest in religious and secular work.

The season for professional entertainment on the Canal Zone is the summer, when lyceum readers, singers, and musicians not busy in the States come here and give entertainments in the Commission clubhouses. This is also the time that lecturers choose. Adresses by distinguished visitors, however, are given throughout the year. Thus it happens that the Canal workers have had opportunities to hear Presidents Roosevelt and Taft, and other prominent Americans.

No reference has been made here to the opera and plays by professional companies at the National Theater in Panama, because these are in the Spanish language, yet the Canal workers form no small part of the audience.

My object in thus calling attention to what has been done is to stimulate further efforts in the dramatic line; so that the Canal worker's entertainment this year may not be confined to minstrel shows, and moving pictures.

INTERLOCUTOR.

Culebra, C. Z., January 1, 1912.

PERSONAL.

Lieut.-Gen. Sir Robert Baden-Powell, of the British Army, retired, founder of the Boy Scout movement, will be a visitor to the Isthmus during the week of January 10.

Civil Service Examinations.

Applications will be received until the close of business on January 8, for the following examinations, to be held probably the last week in January: Stenographer and typewriter, Isthmian Canal and Philippine services; typewriter, Isthmian Canal service. In requesting information and application blanks for any of the above, the name of the examination desired should be stated.

No one should report for examination before ascertaining the exact date on which the examination will be held.

JOHN K. BAXTER,
Secretary, Isthmian Civil Service Board.

BOILER INSPECTION.

Work of the Service Doing Local Inspection—Steamboat Inspection.

There are two branches of boiler inspection in the Canal Zone, one for boilers in local use, including all Canal and Panama railroad equipment except Panama railroad marine boilers, and the other, under the steamboat inspection board, for boilers in seagoing vessels of commercial companies.

The inspection service was organized on June 1, 1907. Prior to that time there had been no regular inspection, and the colored firemen were accustomed to put as much pressure on a boiler as they thought it would stand. There was a large number of old French boilers in the service, and although many of these had been in the shops for repairs, none were in so good condition as new boilers would have been, and their exact rating was not known. Notwithstanding this, and the further fact that there are nearly a thousand boilers in use on the Canal and railroad, there has been only one explosion since the American occupation.

In November, 1909, when the Mechanical Division was reorganized, the boiler inspection service was placed under the direction of the Mechanical Engineer of the Mechanical Division. At present the work is carried on in five districts as follows:

District No. 1—All marine boilers; all boilers at Culebra Island, Flamenco Island, Porto Bello, Toro Point, and Nombre de Dios, with exception of locomotives; 160 boilers.

District No. 2—All boilers from Gorgona to and including Colon, except locomotives, and all at Gorgona except boilers working in shops; 215 boilers.

District No. 3—All boilers from Gorgona to and including Balboa, except locomotives; 235 boilers.

District No. 4—All locomotive boilers; 330 boilers.

District No. 5—All boilers at Gorgona shops, and all sent to shops for repairs; 17 located permanently at Gorgona shops, and about 35 each month on such equipment as has been repaired in shops, same being inspected before being put in service.

Inspections are made at the present time in accordance with the Boiler Inspection Rules and Regulations, effective, September 1, 1911. The basis of the work is expressed in the following paragraph:

> The safe working pressure for boilers shall be determined and fixed by the head of the Boiler Inspection Service. This pressure shall be determined from calculations, detailed examination and, after consideration of the general design, workmanship, and general condition of boiler, giving full weight to the service required of the boiler and the conditions under which it is to operate. In determining the safe working pressure, the head of the Boiler Inspection Service shall fix this working pressure, using a factor of safety not lower than 4.5, except in special cases, when the service demands a higher pressure and a change of boilers is impracticable, in which case a minimum factor of safety of 4.0 may be permitted. Whenever the allowable working pressures set by the head of the Boiler Inspection Service are considered by operating divisions as being so low as to impair the efficiency of the plant, the division head will request re-examination and re-calculation of the boiler in question.

In order that the inspection may not interfere with the construction work, it is not so rigidly conducted as it would be by a similar service in the United States. It would often hamper the construction work to shut down equipment for repairs, and therefore repairs are made only when they are absolutely necessary, or when the equipment can be conveniently spared. When a boiler is to be shut down temporarily the district inspector is notified by telephone, and the boiler is prepared for his inspection. Every boiler is inspected once a year for hydrostatic test, once a year for interior defects, and once every six months for external defects, and these inspections are so timed that they come at about three month intervals throughout the year. All parts possible are inspected, and also such fittings as safety valves, steam gages, gage cocks, and fusible plugs. In addition to this regular inspection there is a constant watch kept upon locomotive boilers by the traveling engineers.

The falling of the crown sheet of a steamshovel boiler in Culebra Cut led to the adoption of a Central Division inspection for steamshovel boilers. This is maintained without extra expense by detailing four of the boilermakers from Empire shops to visit five shovels each, every Sunday, watch the washout, and make inspection. The men who do this are given a holiday during the week to make up for the Sunday work. Since there are about fifty shovels at work in the Cut, each boiler is inspected approximately once in three weeks. This is in addition to the inspection by the regular service, and also in addition to the inspection that a boiler is given when the shovels are taken into the shops for repairs.

One of the features of the inspection is the record kept in the office of the Mechanical Division at Gorgona of all boilers in the service. By turning to this record it can be ascertained at any time just what the condition of a boiler is, its class, capacity, age, service, tests, repairs, and latest inspection. By systematic recording a duplication of work and the probability of neglecting any boiler are avoided. A list is also kept of all boilers out of service, and these may not be returned to work until after they have passed inspection.

Boilermakers familiar with all kinds of boilers are chosen for the service, and thus practical inspection is assured. The inspectors make their reports direct to the Mechanical Engineer of the Mechanical Division, who notifies the division department heads once a week of the result of inspections. Attention is directed to the condition of the boilers, and the responsibility for repairs, or further use without repairs, then rests with the head of the division or department. In the case of locomotive boilers, the traveling engineers are also notified. When a boiler is found in dangerous condition the head of the division or department is advised at once so that the boiler may be taken out of service The inspector of locomotives works at night at the engine houses where the locomotives tie up for washout and hostling. Other inspectors arrange by telephone for the cooling down of boilers. In this way no time is wasted either by the inspectors or in the use of the boilers to be inspected.

Boilers in the service of others than the Isthmian Canal Commission or Panama railroad, such as the Union Oil Company, contractors, etc., are inspected upon request of parties owning or using them, in the same manner as regular inspections.

Inspection of boilers in vessels coming into Canal Zone waters from other ports, including the vessels of the Panama Railroad Steamship Line, is made by the Board of Local Inspectors, established for the Canal Zone under Executive Order of October 2, 1909. This Board has recently appointed its own inspector, and the inspection of boilers in common with other equipment of vessels is now in progress.

FREIGHT ON PANAMA RAILROAD.

Summary of Traffic for Quarter Ending September 30, 1911.

The tonnage of freight carried by the Panama railroad during the three months ending September 30, 1911, showed an increase of 86,678 tons, or 26 per cent, over that for the corresponding period during the year previous. The following table shows the tonnage to various destinations handled during the respective quarters:

FROM ALL POINTS TO ALL POINTS.

	July 1, to Sept. 30, 1911	July 1, to Sept. 30, 1910	Increase
Colon to Panama (through)—			
From New York and other Atlantic ports	55,029	24,610	30,419
From Gulf ports	7,071	5,932	1,139
From Europe	35,257	26,058	9,199
Total	97,357	56,600	40,757
Colon to Panama (local)			
Commercial	36,667	31,962	4,705
Isthmian Canal Commission	177,154	168,474	8,680
Company's freight	3,621	6,500	* 2,879
Total	217,442	206,936	10,506
Total westbound freight	314,799	263,536	51,263
Panama to Colon (through)—			
To Colon	61	15	46
To New York and other Atlantic ports	44,568	21,850	22,718

CULEBRA CUT.

Excavation in December and for 1911 Greatest of Record.

The excavation in Culebra Cut in December, 1,351,082 cubic yards, was the greatest accomplished in any December of the eight since the American canal work was begun. It brought the total for the year up to 16,596,891 cubic yards, and this is the greatest that has been accomplished in any year. The record for previous Decembers, and for previous years, compared with December, 1911 and the year 1911, follows:

EXCAVATION IN CULEBRA CUT, DECEMBER, 1904 TO 1911

December.	Cubic Yards.
1904	42,935
1905	70,630
1906	307,689
1907	1,025,485
1908	1,210,046
1909	1,152,022
1910	1,211,400
1911	1,351,082

EXCAVATION IN CULEBRA CUT, YEARS, 1904 to 1911.

Year.	Cubic Yards.
1904	243,472
1905	914,254
1906	2,702,991
1907	9,177,130
1908	13,912,453
1909	14,557,034
1910	15,398,599
1911	16,596,891
Total	73,502,824

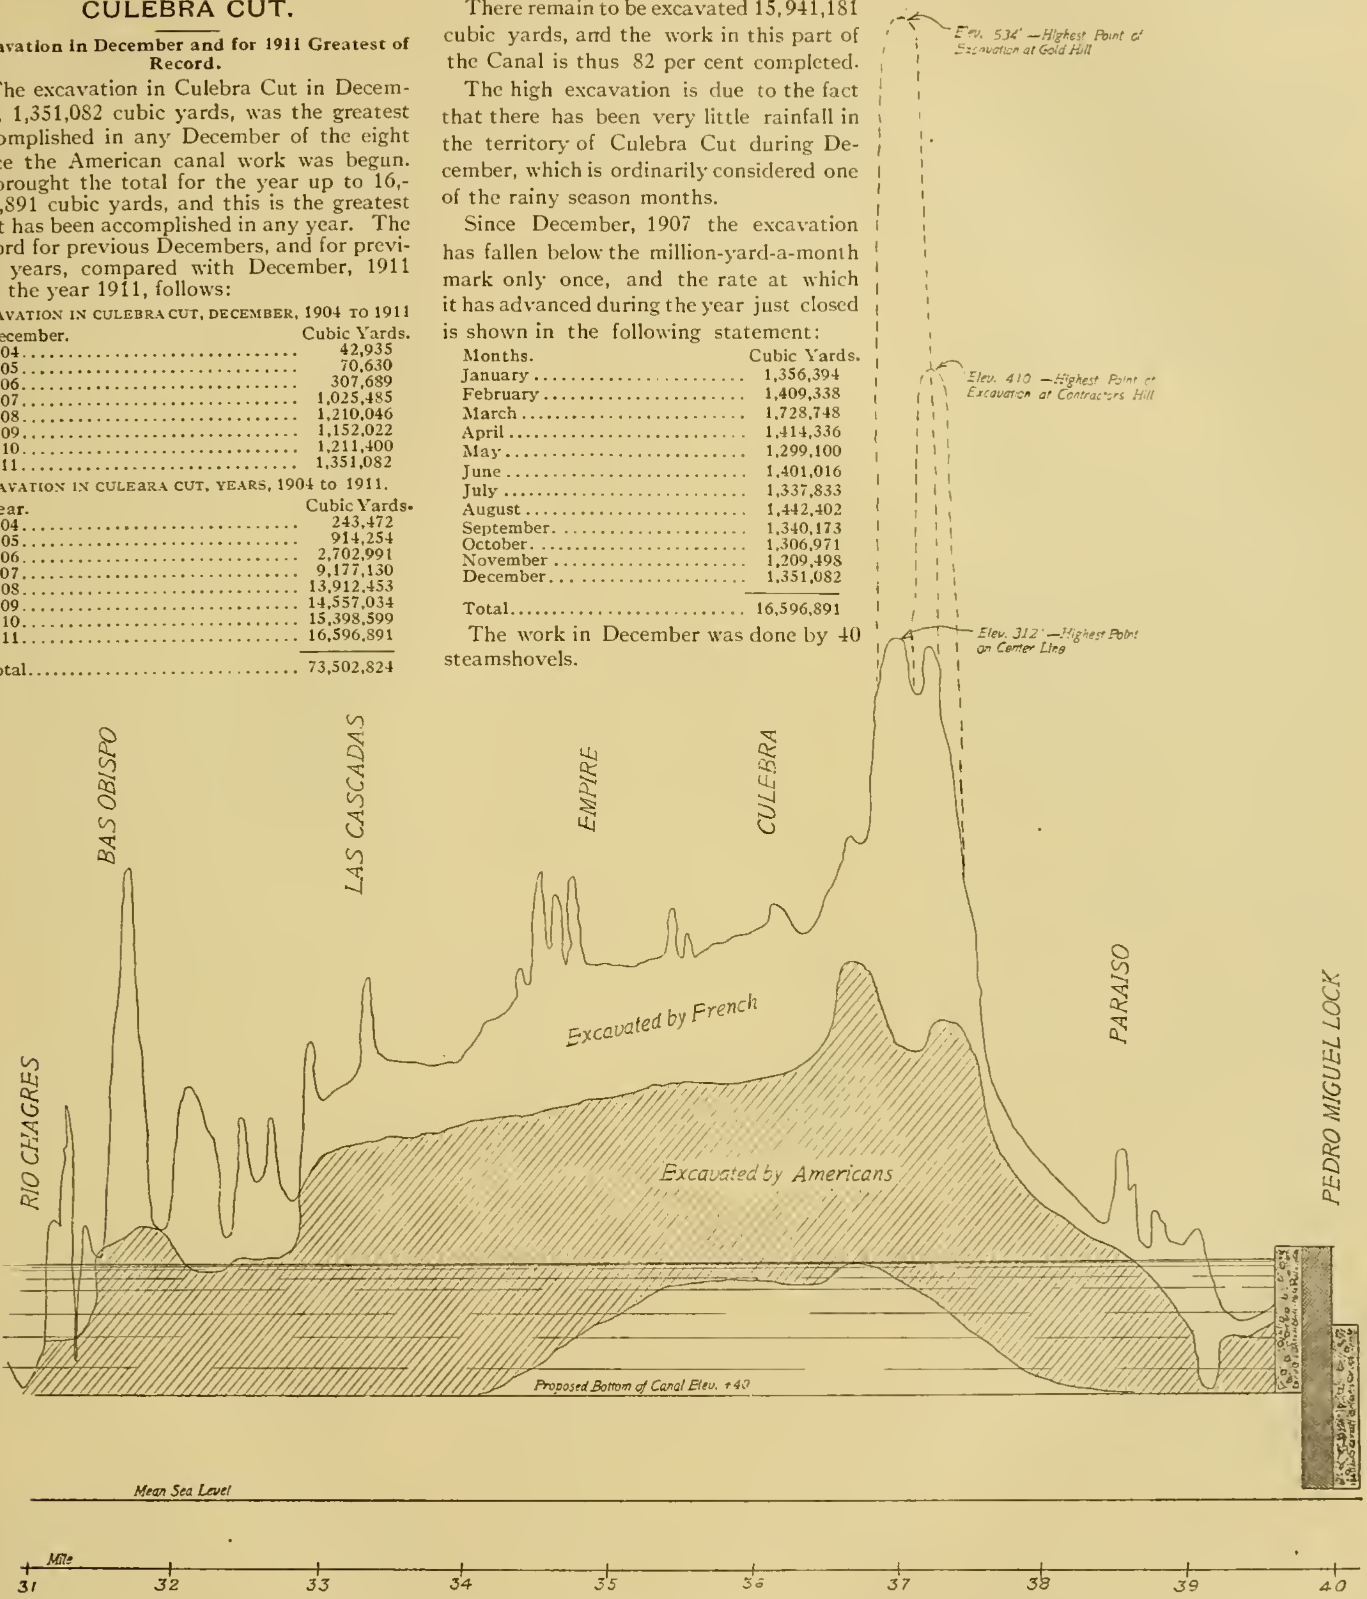
There remain to be excavated 15,941,181 cubic yards, and the work in this part of the Canal is thus 82 per cent completed.

The high excavation is due to the fact that there has been very little rainfall in the territory of Culebra Cut during December, which is ordinarily considered one of the rainy season months.

Since December, 1907 the excavation has fallen below the million-yard-a-month mark only once, and the rate at which it has advanced during the year just closed is shown in the following statement:

Months.	Cubic Yards.
January	1,356,394
February	1,409,338
March	1,728,748
April	1,414,336
May	1,299,100
June	1,401,016
July	1,337,833
August	1,442,402
September	1,340,173
October	1,306,971
November	1,209,498
December	1,351,082
Total	16,596,891

The work in December was done by 40 steamshovels.



EXCAVATION ON THE CENTER LINE IN CULEBRA CUT ON JANUARY 1, 1912.
Lowest Cut is in Drainage Ditch, but is only a single cut. Excavation is 82 per cent completed.

Panama Railroad Gravel Pit Operations.

The Panama railroad has opened up its old gravel pit about one-half mile above Gamboa Bridge and is now loading ballast cars directly from the gravel bed. Due to lack of high water during the past rainy season this old pit did not fill up as much as it has ordinarily done in the past but it is believed about 20,000 cubic yards of gravel can be secured by clam shell.

An additional gravel pit is being opened up about one mile further up stream. A spur track turning off the Central Division powder spur near the magazine is being constructed to reach this upper pit. It is necessary in this case to drive a temporary trestle across the Chagres River as the gravel bed lies on the south side. It is estimated there are 75,000 cubic yards of good gravel available in this upper pit.

Seventy-five thousand cubic yards of gravel were secured from the old pit during the last dry season which has been used to excellent advantage in ballasting the Relocated Line and in furnishing material for concrete.

SOCIAL LIFE OF THE ZONE.

Women's Organizations.

An election of officers was held by Rebekah Lodge No. 1, Gorgona, on Friday evening, December 22, when the following were elected: Mrs. George Martin, noble grand; Mrs. Anna McCann, vice-grand; Edward Wall, secretary; Harry W. Sotz, financial secretary; Mrs. Annie Calvit, treasurer. The remaining roster of officers will be filled at the installation meeting, the date of which will be determined later.

The January meetings of the Order of the Eastern Star will be held on the second and fourth Wednesday evenings in the month. Fifteen applications for membership have been filed.

The schedule of meetings for January in the Cristobal Woman's Club, with the subjects of the programs, is as follows: On January 3, at 3.30 p. m. in the commission clubhouse, general meeting with Judge Thomas E. Brown, Jr., as speaker on the question of the prevention, cure or punishment of crime; on January 10, at 3 p. m. in the clubhouse, the home department has papers on home life in Japan; on January 17, at 3 p. m. in the clubhouse, the art department will hold an exhibit of pictures with general discussion. On January 24, at 9 a. m. in the clubhouse, meeting of the executive board. On January 27, the Cristobal club will be the entertaining club for the annual meeting of the Canal Zone Federation of Woman's Clubs.

Salvation Army.

On Christmas Day one hundred and forty meals were served in the restaurant of the Salvation Army Social Institute in Colon, this being greater than the average number served on any holiday. The army will rebuild its meeting hall on the old site within a short time, and the hall on D Street, at present in use for indoor meetings will be abandoned. The annual offering raised in Harvest Festival week in November amounted to $500, which sum will be devoted, one-half to the work of the local corps; one-quarter to the divisional corps, and one-quarter to the territorial fund which is held for general work at headquarters in Kingston.

Visitation of Bishop Knight.

The following changes have been made in itinerary of the Rt. Rev. Bishop Albion W. Knight who is at present on his annual visitation to the Protestant Episcopal churches on the Isthmus: On Saturday, January 6, the ordination service will be held at St. Mark's Church, Culebra, at the time of the convocation of the clergy, and on Wednesday evening at 8 o'clock the bishop will be at St. Luke's Hospital Chapel, Ancon.

Church Notes.

The midnight service on Christmas Eve, at Christ Church By-The-Sea, Colon, was attended by a congregation of over 400. The service consisted of a full choral celebration of the Holy Communion and was of two hours' duration. This is the first time that the midnight celebration has been held in the church. On New Year's Eve the usual watch night meeting was held.

Pipe Organ at St. Luke's Church.

A small pipe organ has been installed in St. Luke's Hospital Chapel, Ancon, and was dedicated on Sunday evening, December 31, when there was a song service followed by an organ recital. The instrument is from the builder, R. Spurder Rutt of London, being one of the type especially constructed for the tropics. It has one manual, pedals, five complete stops and two hundred pipes. The case is of light oak and the visible pipes of silvered aluminum. The organ was purchased by subscription and other efforts on the part of the congregation of St. Luke's Church in 1909 and 1910.

The Little Workers, the girls' club of Gorgona, presented to the community Christmas tree 350 stockings which they made at their meetings. The club is taking a short recess but will reconvene in January, when the lessons in sewing will be resumed.

United Spanish War Veterans.

Installation of officers of Camp Chagres No. 2, will be held in the Kangaroo Hall at Empire, January 14, at 3.00 p. m. A Ladies' Auxiliary is to be formed on this date and all eligibles are requested to be there. Refreshments will be served.

Masonic Banquet.

Sojourners Lodge No. 874. A. F. and A. M. celebrated the fifteenth installation of officers by a banquet held at the Washington Hotel on Saturday evening. December 30. The dining room was decorated with palms flags, and emblems of the order. Music was furnished during the evening by the Tenth Infantry Orchestra. There were 200 ladies and gentlemen present.

Commissary Books.

The expense of issuing commissary books per book by division or department has been as follows:

Atlantic	$0.0583
Central	.0525
Pacific	.0529
Mechanical	.0507
Quartermaster	.0567
Commissary-Subsistence	.0407
Sanitation	.1137
Civil Administration	.0827
Examiner of Accounts	.0173
Disbursing Office	.0164
Total Isthmian Canal Commission	.0558
Panama Railroad Company	.0410

Rainfall from December 1 to 31, 1911, inclusive.

EXECUTIVE ORDER.

To Prohibit the Practise of Medicine, Surgery, Dentistry, Pharmacy, or Midwifery Without a License.

By virtue of the authority vested in me I hereby establish the following order for the Canal Zone:

Section 1. It shall be unlawful for any person to practise or attempt to practise medicine, surgery, dentistry, pharmacy or midwifery within the Canal Zone without first having obtained a license therefor from the Board of Health of the Canal Zone. Any person thus offending shall be punished by a fine not exceeding Twenty Five Dollars ($25.00), or by imprisonment in jail not exceeding thirty (30) days, or by both such fine and imprisonment in the discretion of the court: *provided* that this order shall not apply to commissioned surgeons of the United States Army and Navy, or Marine Hospital Service, nor to physicians, surgeons, dentists or pharmacists and their assistants and nurses employed by the Isthmian Canal Commission, nor to nurses acting under the orders of a licensed physician.

Section 2. Whoever not having registered as aforesaid shall advertise or hold himself out to the public as a physician or surgeon by appending to his name the letters M. D. or using the title of doctor meaning thereby a doctor of medicine or shall pretend to a knowledge of medicine or surgery shall be punished by a fine not exceeding Twenty Five Dollars or by imprisonment not exceeding thirty days or by both in the discretion of the court.

Section 3. Any person shall be regarded as practising medicine within the meaning of this order who shall prescribe for, operate on, or in any wise attempt to heal, cure or alleviate, or who shall in any wise treat any disease or any physical or mental ailment of another: *provided* that nothing in this order shall be construed to prohibit (*a*) The practice of the religious tenets of any church in the ministration of the sick or suffering by mental or spiritual means without the use of any drug or material remedy whether gratuitously or for compensation provided that such sanitary laws, orders, rules and regulations as now are or hereafter may be in force in said Canal Zone are complied with; or (*b*) Gratuitous services in case of emergency; or (*c*) The administering of ordinary household remedies.

Section 4. This order shall take effect on January 1, 1912.

WM. H. TAFT.

THE WHITE HOUSE,
December 26, 1911.

Independent Order of Odd Fellows.

The District Deputy Grand Sire for the district of Panama, B. F. Sisson, will install the officers of the several Odd Fellows' lodges as follows: Isthmian Canal Lodge No. 1, Gorgona, Tuesday, January 16; Cristobal No. 2, Cristobal, Monday, January 8; Canal Zone No. 3, Empire, Saturday, January 13; Pacific No. 4, Ancon, Thursday, January 18; Gatun No. 5, Gatun, Friday, January 5; Isthmian Canal Rebekah Lodge No. 1, Gorgona, Friday, January 12.

On Christmas Day the Colon Humane Society distributed gifts and candy to 500 children in the schoolhouse, after which they went out to the public playground were the municipal band gave a concert.

OFFICIAL CIRCULARS.

Ratings and Rates of Pay.

CULEBRA, C. Z., December 26, 1911.

HEADS OF DEPARTMENTS AND DIVISIONS:

The helpers on an hourly basis of blacksmiths, boilermakers, and other mechanics will be paid in accordance with Section 38 of the Timekeeping Rules for the time actually spent by them in preparing and cleaning fires and other similar work immediately before and after each working period of four hours.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

CULEBRA, C. Z., December 27, 1911.

CIRCULAR No. 299-P.

The following designation and rate of pay is authorized in addition to those published in Circular No. 299, viz.:

Designation.	Unit.	Rate of Pay.
Coach Painter	Hr.	.65

The above designation and pay therefor will apply only to the Gorgona Shops of the Mechanical Division.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Broken Staybolts Plugged by Locomotive Engineers.

CULEBRA, C. Z., December 27, 1911.

CIRCULAR No. 259-A.

Whenever it becomes necessary for a locomotive engineer to plug a broken staybolt he must notify the engine house foreman of such action on his regular work report of that evening, stating the number and location of bolts plugged by him. Engine house foreman will notify the Mechanical Engineer of the Mechanical Division of all bolts plugged by his engine house forces, and of all bolts reported plugged by locomotive engineers.

GEO W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Meetings of Mechanical Committee.

CULEBRA, C. Z., December 27, 1911.

CIRCULAR No. 383-A.

The meetings of the Mechanical Committee appointed by Circular No. 383, dated April 18, 1911, will be held bi-monthly instead of monthly, beginning with the month of January, 1912.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Reprimand and Suspension.

CULEBRA, C. Z., December 28, 1911.

HEADS OF DEPARTMENTS AND DIVISIONS:

Your attention is directed to Circular No. 196 of August 12, directing that copies of all letters of reprimand or caution and reports of all suspensions be forwarded to this office for the personnel records maintained here. I have recently noticed that this is not being done in all cases, and that the personnel records of division offices contain numerous letters of reprimand and letters which indicate the quality of service an employe is rendering, copies of which are not furnished the files of this office. It is directed that strict attention be given to the instructions heretofore issued, and anything which would throw light on the character of an employe's service, whether it be a criticism or commendation of his work or conduct, be reported to this office by furnishing tissue carbon copies of the essential parts of the correspondence.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Shop Expense Percentage.

CULEBRA, C. Z., December 28, 1911.

HEADS OF DEPARTMENTS AND DIVISIONS:

In accordance with the provisions of Circular No. 169-E, a shop expense percentage of thirty percentum is hereby fixed for the Panama Railroad Shops, effective January 1, 1912, and will be applied, until further orders, to the distributed labor used in all shop work, in accordance with the provisions of Circular No. 264-A.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Fusible Plugs for Isthmian Canal Commission and Panama Railroad Boilers.

CULEBRA, C. Z., December 29, 1911.

CIRCULAR No. 343-C.

All fusible plugs used in boilers of the Isthmian Canal Commission and the Panama Railroad Company will be filled only by the Mechanical Division of the Commission at the Gorgona Shops.

All fusible plugs requiring refilling, that are otherwise serviceable, will be saved and turned into the Quartermaster's Department and sent by the latter to the Gorgona Shops for refilling. Lots of fusible plugs that were filled in the States, and the proper action of which has proved questionable, will be refilled by the Gorgona Shops.

The Superintendent of the Mechanical Division will have all fusible plugs filled, as far as practicable, by one employe selected for his competency to perform the work. Each plug will be legibly marked to show the employe who filled it.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Card Passes.

PANAMA RAILROAD COMPANY,
OFFICE OF GENERAL SUPERINTENDENT,
COLON, R. P., December 27, 1911.

CIRCULAR No. 332.

All 1911 Annual Card Passes will be honored for passage up to and including January 15, 1912.

J. A. SMITH, *General Superintendent.*

DATE.	Low	High	Low	High	Low
	A.M.	A.M.	A.M.	P.M.	P.M.
January 4	......	2.50	9.14	3.26	9.38
Jaauary 5	......	3.42	10.05	4.16	10.30
January 6	......	4.31	10.54	5.05	11.20
January 7	......	5.21	11.42	5.53	......
			P.M.		
January 8	12.09	6.10	12.30	6.41	......
January 9	12.59	7.01	1.20	7.31	......
January 10	1.50	7.52	2.12	8.23	......

The following ships arrived at or departed from the port of Balboa during the week ending December 30:

Arrivals—December 25, *Quilpue*, from Valparaiso; December 25, *Trinculo*, from Port Harford; December 26, *San Juan*, from San Francisco; December 26, *Urubamba*, from Callao; December 27, *Oberon*, from Port Harford; December 28, *Leelanaw*, from San Francisco; December 29, *City of Para*, from San Francisco.

Departures—December 27, *Trinculo*, to Port Harford; December 28, *Aysen*, to Valparaiso; December 29, *Oberon*, to Port Harford; December 31, *Urubamba*, to Callao.

Auction of Unclaimed Shipments.

PANAMA RAILROAD COMPANY,
OFFICE OF GENERAL SUPERINTENDENT,
COLON, R. P., December 8, 1911.

In order to recover freight and storage charges, the Panama Railroad will dispose of the accumulation of Over and Unclaimed Shipments now in its possession, by public auction, commencing Wednesday, January 10, 1912, at 9.30 a. m.; sale to be held on Dock No. 11, Cristobal, C. Z.

The items to be sold consist of a miscellaneous assortment of wines, liquors, household goods, building material, stationery, groceries, dry goods, machinery, and merchandise in general, all of which has been held six months and over in an effort to locate owner.

J. A. SMITH, *General Superintendent.*

Sale of Public Building.

OFFICE OF THE CHIEF QUARTERMASTER,
CULEBRA, C. Z., December 22, 1911.

Sealed proposals will be received at this office until 3 p. m. Friday, January 5, 1912, and then opened for the purchase of building No. 13, located at San Pablo. Successful bidder will be required to remove building within thirty (30) days from date of sale, and will be granted the Commission freight rate over the Panama Railroad for material recovered from same. Proposals should be accompanied by certified check, post office money order, or cash for 5 per cent of amount bid. The Government reserves the right to reject any or all bids. Envelopes containing proposals should be endorsed "Proposal for Purchase of Building" and addressed to Colonel C. A. DEVOL, *Chief Quartermaster.*

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

GENERAL.

The moving picture schedule for the week of January 8 to 13, is as follows: Empire, Monday; Corozal, Tuesday; Culebra, Wednesday; Gorgona, Thursday; Cristobal, Friday; Gatun, Saturday.

EMPIRE.

Thirteen men entered the duck pin Isthmian tournament rolled at Cristobal on January 1.

The monthly handicap pool tournament which was played during the month of December was won by Mr. Hirsh, second place by Mr. J. King. Another tournament will be played during January.

The following is the standing of the chess tournament players.

Name.	Won.	Lost.
Pulsifer	15½	0
MacCoullough	9	4
Sherfey	13	8
Smith	3	3
Caldwell	5	3
Ross	4	7
Lippert	2	6
Warr	2	9
Newbold	2	4
Connor	0	4
Sine	0	6

Twenty names have been entered for the Spanish class which will meet every Tuesday night. A ladies' class will be formed if there are a number that care to take Spanish.

GATUN.

A Spanish class for the ladies of Gatun was organized December 29, with nine members. The two classes for men have an enrollment of 39.

The 10th Infantry Band gave a concert at the Gatun clubhouse on Thursday evening, December 28.

The Y. M. C. A. Choral club met on Tuesday, December 26. A sacred concert with the oratorio, "The Holy City," will be given during the early part of February.

An athletic meet will be held in the Gatun gymnasium on Saturday evening, January 6, between the Gorgona and the local athletes. This will be the first of a series of preliminary meets preparatory to the Inter-Association Meet to be held at Empire on February 22.

Dr. Weinstein of Monte Lirio addressed the Discussion Club on Sunday evening, December 31. His subject was "A Social Problem." Twenty-six men were present.

G. A. Barte has resigned from the management of the bowling alleys and is succeeded by Messrs. Durand and Wurster.

"Open House" was observed at the clubhouse on New Year's Day. All games were free until 6 p. m. Moving pictures were shown in the evening; G. K. Weston sang songs illustrated by colored slides.

CRISTOBAL.

Six hundred people enjoyed the concert of the Tenth Infantry Band from Camp Otis on Monday evening, December 25.

The sessions of the Literary and Debating Club will be resumed on Wednesday evening, January 10. At the session the installation of the officers-elect will take place. The subject for debate is :"Resolved, that the awakening of the yellow race is inimical to the economic and social welfare of the white race."

On Friday afternoon, January 5, there will be a session in Spanish to which all women who may desire to learn to speak Spanish are invited. Mr. Gomez will demonstrate his system. The session will begin at two o'clock. It is the purpose of the association to start a class for women providing a sufficient registration can be obtained. All details may be secured at the office. On January 9, there will be a sample session in Spanish for men at which Mr. Gomez will also demonstrate his work. All men, whether members of the association or not, are invited to attend the sample session, which meets at 8 p. m.

The local rag-time tournaments closed December 30, with the following teams in the lead: Ten Pins—Louch and Collins, 1,198; Duck pins—Barrett and Louch, 605; Candle Pins—Barrett and Bullard, 589.

The following high scores were made during the week ending December 30: Duck pins—Wheeler, 106; Claherty, 101, 101, 103; Jacques, 100; Smith, 107, 103, 102; Carty, D., 101; Herring, 101; Louch, 107, 107; Barrett, 102, 112; Weston, 109; Barte, 107; Bullard, 106, 106, 102, 104; Collins, 117; Gibson, 115; Herrington, 101, 101, 103; Farrell, A., 110; Orr, 118.

Candle pins—Collins, 108, 116, 103, 101; Grover, 107, 102, 108; Weston, 104, 105, 109, 103; Smith, 110; Claherty, 103; Marquez, 108; Louch, 103; Bullard 101, 110, 110, 100, 101, 101, 101, 119; Herring, 117, 104, 103; Barrett, 100, 103, 101, 108, 105.

Ten pins—Adams, 202; Louch, 201, 249; Barte, 211, 245; Collins, 219, 247, 215, 212, 210; Rabbitt, 204, 214; Gibson, 204, 204.

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning January 1, 1912.

NOTES OF PROGRESS.

New Filtration Plant in Service.

Water from the new filtration plant at Agua Clara Reservoir, which supplies the villages of Gatun, New Gatun, and Spillway, was turned into the mains on December 29 and the carts, which had been delivering distilled water to the houses for drinking and domestic purposes, were dispensed with on January 5. Water for all purposes is now drawn directly from the taps. The Agua Clara filtration plant is the first of its kind on the Isthmus, being distinguished from those previously constructed principally in having the water pass through the filter beds by gravity, instead of under artificial pressure.

Canal Work in December.

The grand total of Canal excavation to January 1 was 158,092,940 cubic yards, leaving to be excavated 37,230,439 cubic yards, or about one-fifth of the entire amount for the completed Canal.

The total for December was 2,439,276 cubic yards, as compared with 2,946,404 cubic yards in December, 1910, and 2,811,681 cubic yards in December, 1909.

The dry excavation amounted to 1,542,593 cubic yards, and was principally by steam shovels. The dredges removed 894,346 cubic yards, and 2,337 cubic yards were sluiced in the Central Division, in addition to the amount pumped into Gatun Dam by suction dredges. The progress on the locks at Gatun, Pedro Miguel, and Miraflores is referred to elsewhere in this issue.

In the Atlantic Division, the total excavation was 665,585 cubic yards. Of this total, 50,199 cubic yards were dry excavation, and the remainder was removed by dredges in the Atlantic entrance.

The total excavation in the Central Division was 1,361,981 cubic yards, all of which was from the prism. The amount taken from Culebra Cut was 1,351,082 cubic yards, as compared with 1,211,400 cubic yards in December, 1910.

In the Pacific Division, the total excavation was 411,800 cubic yards, 278,960 cubic yards of which were taken out by dredging at the Pacific entrance.

A detailed statement of the excavation, and a summary of the work on the locks and dams, follow:

Mean rainfall along Canal (eleven stations), 1.19 inches.

By "Work" excavation is meant excavation actually made for one of the constituent parts of the Canal, such as prism, diversions, or locks, etc.; that is, it represents material taken from the area to be occupied by the Canal and constitutes excavation useful for the completed Canal.

By "Plant" excavation is meant excavation outside of any of the constituent parts of the Canal, such as prism, diversions, or locks, etc. It includes material necessary to be excavated for construction purposes only, and is chargeable against the particular plant item for which it is performed, such as prism, diversions, locks, etc.

Lower Approach Floors at Pedro Miguel.

Drainage from the portion of Culebra Cut south of the summit, near Empire, passes through a ditch in the upper approach to the east chamber at Pedro Miguel Lock and flows through a culvert in the center wall to a point below the site of the lower guard gates, where the culvert debouches into the lower approach chambers, on both sides of the approach wall. For the purpose of laying the floor in the west approach, the apertures on that side were stopped with timber gates and the water was passed through a diked channel at the east base of the approach wall, passing into the Rio Grande below the locks. That floor having been finished, the water has been turned into the west chamber in order that the flooring for the east chamber may be completed. To prevent backflooding above the aperture a dike of sacks of cement has been thrown across the chamber on the sill for the lower guard gates. A locomotive crane, equipped with grab-bucket, has been engaged in making a channel for the flow of the water into its former path to the Rio Grande. Steamshovel No. 50 is engaged in removing the levee of earth and sheeting by which the water was formerly conducted down the east side. A steam pump is drawing the backflow and rain water from the lower east chamber, and the electrically operated pump, which has been in use for that purpose, will be removed.

New Main from Rio Grande Reservoir.

Pipe is being distributed for the laying of the new 20-inch water main from the Rio Grande Reservoir to Panama, to replace the present 16-inch pipe line. The contract for materials calls for 49,000 linear feet of 20-inch pipe, with accessory tees, bends and reducers. The new line will follow the location of the present main as far as Pedro Miguel Lock, where it will cross the Canal by being set in the concrete of the piers and sills for the emergency dams, at the upper end of the lock proper. From Pedro Miguel to Panama it will follow the line of the Panama railroad. Along the portion of the track bordering on Miraflores Lake it will be laid well above the normal surface of the lake. The new main will have an increased capacity of, theoretically, 56 per cent above the old one. It is probable that the capacity of the Rio Grande Reservoir will, later on, be increased by building higher the retaining dam.

Removal of Dike at Mindi.

A natural dike of rock separates the water in the Canal channel between the Atlantic Ocean and Mindi from the excavation made by steamshovels and dredges between Mindi and Gatun Locks. It is planned to remove this dike by blasting, allowing the water to submerge the channel, and to complete the excavation with dredges. It is about 700 feet long, crossing the 500-foot channel at an angle. The top is about 40 feet wide and the sides slope approximately 2 on 3. Excavation is to be made to 41 feet below sealevel.

The dike will be perforated from the inland side with horizontal rows of 100 drill holes.

NOTES OF PROGRESS.

(Continued.)

at such intervals as the nature of the material warrants and the rows will be set off in succession from the bottom of the dike, all of the charges in each row being exploded simultaneously. After a row has been discharged and any resulting large bowlders have been reduced by "dobie" blasts, water will be siphoned over the top of the dike to fill the channel beyond to the level above that of the discharged row of holes. Then the next row will be set off and the siphoning will be continued; and so on until the final blast will remove the last barrier between the two sections of channel, the waters of which will by that time have reached nearly the same level. The procedure of letting the water in gradually is designed to prevent a rush which might injure the dredges. After the dike has been broken up, ladder and dipper dredges will remove the submerged fragments of rock.

Until the time for removing the dike the two steamshovels at Mindi will furnish spoil to fill a trestle east of the main line of the Panama railroad and forming, with the railroad embankment and hills at the ends, a lagoon, about 1,000 by 4,000 feet, into which will be piped spoil from the suction dredges at work in the Atlantic entrance channel. The surface of the lagoon will be raised about fifteen feet from its present elevation at 7 feet above sealevel.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 74 per cent completed, 167,436 cubic yards, out of a total of 225,000, having been placed at the close of work on January 6. A statement of the amount laid each working day last week, and of the total in place, follows;

Date.	Concrete Laid.	Hours worked	No. Mixers.
January 1. (Holiday)	....	....	....
January 2	88	8.00	2

Removal of Mixing Plant at Pedro Miguel.

The 2-cubic yard concrete mixer, at the south end of the east side wall of Pedro Miguel Lock, which was part of the permanent mixing plant, has been torn down and hauled to Gorgona shops for general overhauling and repairs. When these are made it will be taken to Miraflores Locks and mounted on the berm crane on the east side which has so far been equipped with only one mixer, likewise of 2-cubic yard capacity. At Pedro Miguel, the mixer supplied the chamber crane in the east chamber and filled buckets which were hauled by narrow gage railway to different parts of the locks. It supplied some of the concrete for the southeast wing wall but the remainder is to be furnished from ½-cubic yard portable mixers.

CONCRETE WORK IN THE LOCKS.

Over 75 per cent of the concrete for the locks is in place, the amount at the close of work on January 6, being 3,170,816 cubic yards, out of a total of approximately 4,199,400. A total of 20,950½ cubic yards of concrete was laid in the locks during the week ending January 6.

GATUN LOCKS.

Over 88 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on January 6, being 1,773,462 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending January 6, and of the total, follows; and a similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

STEAMSHOVEL RECORDS.

Work of Central Division and Panama Railroad Relocation Steamshovels.

During the month of December the total amount of material excavated in the Central Division was 1,361,891 cubic yards, of which 164,252 cubic yards were classified as earth. and 1,197,639 cubic yards as rock. Of this quantity 1,351,082 cubic yards were removed by steamshovels, contractors removed 2,337 cubic yards by sluicing and 8,472 cubic yards by hand.

The high record for the month was made by shovel No. 219, working 25 days in the Culebra District, which excavated 46,322 cubic yards of rock. The second best record for the month was made by shovel No. 207, working 25 days in the Culebra District, which excavated 45,223 cubic yards of rock. The best record for a shovel of the seventy-ton class was made by shovel No. 126, working 25 days in the Culebra District, which excavated 33,040 cubic yards of earth.

Shovel No. 212, working in the Culebra District, made a high record for one day by excavating 3,204 cubic yards of rock on December 4.

Except where noted, monthly reports are computed by place measurement, while the daily reports are based on car measurement. The best records for the month and for one day are shown below:

BEST RECORDS FOR THE MONTH.

Relocated Line of Panama Railroad.

The total steamshovel excavation on the relocated line of the Panama railroad amounted to 345,520 cubic yards.

The best month's record was made by steamshovel No. 257, working on the Gatun section, which excavated 58,380 cubic yards of solid rock.

In the 70-ton class, the best month's record was made by steamshovel No. 123, working near Empire, which excavated 19,260 cubic yards of earth and 12,500 cubic yards of solid rock, a total of 31,760 cubic yards.

The best day's record for shovels with a 5-yard dipper was made by steamshovel No. 262, which excavated 3,400 cubic yards of rock on December 2.

The best day's record for shovels with a 3-yard dipper was made by steamshovel No. 117, which excavated 2,100 cubic yards of rock on December 11.

Month's records are place measurement, and day's records are car measurement.

All material was loaded in 10-yard Western dump cars.

BEST RECORDS FOR THE MONTH.

Total steamshovel output during the month of December, 345,520 cubic yards.

Total number of steamshovel working days, 260.

Average output per working day, 1,329 cubic yards.

Debts of Employes.

In reply to a request from the Colon Board of Commerce that the Commission take steps to have a bankruptcy or garnishee law passed for the Canal Zone to compel Canal employes to pay their debts, the Chairman has informed the Board that it is not considered practicable to take any action along this line at the present time. He informed the Board, however, that the following circular issued on December 28, 1904 is still in effect:

> Failure to meet commericial obligations is regarded as inconsistent with the qualities desired in employes of the Commission, and as impairing their efficiency. The Chief Engineer will therefore consider refusal to pay just debts, contracted on the strength of the employe's status as such, as sufficient cause for dismissal.

The present policy, in addition to that of the circular, is stated as follows:

> When an employe denies the alleged obligation, or the amount of the obligation is in dispute, I can take no action unless the creditor brings suit and obtains judgment for a definite amount. I must also refuse to assist in the collection of bills for liquors sold at retail, as the Commission does not wish saloon keepers to extend credit to its employes, and will not recognize or encourage the practice.

December Rainfall for Three Years.

CANAL ZONE CENSUS.

Scope of the Work and Questions to be Asked.

Arrangements have been completed for the second census of the Canal Zone, which will be begun on February 1, and will be finished as rapidly as possible. It is believed that the compilation of the results will take about two months. The work is in charge of the Department of Civil Administration, and under the direction of Edward W. Koch, of the Bureau of the Census at Washington, and C. L. Luedtke, assistant chief clerk of the Department of Civil Administration. The census will include an enumeration of all residents of the Canal Zone, and employes of the Isthmian Canal Commission and Panama Railroad Company residing in Colon, Panama, Porto Bello, and at other points outside the Canal Zone on the Isthmus or in Isthmian waters. The questions to be asked follow:

1. Name of person.
2. Metal check number.
3. Sex.
4. Color.
5. Age at last birthday.
6. Whether single or married.
7. Whether deaf and dumb, blind, insane, or imbecile.
8. Place of birth.
9. Country of which citizen or subject.
10. Date of first arrival in the Canal Zone.
11. Date of arrival at present location.
12. If location has been changed since February 1, 1912, state former location.
13. Whether able to read.
14. Whether able to write.
15. Whether able to speak English or if not give language spoken.
16. Occupation.
17. Where and by whom employed.

For purposes of enumeration the Canal Zone will be divided into four districts comprising the territories of the old administrative districts of Ancon, Empire, Gorgona, and Cristobal. The work in each of these districts will be under the direction of a supervisor. Each district will in turn be divided into enumeration sections comprising towns, villages, localities, labor camps, etc., for the more densely populated areas; and two sections in each district for the rural population. After a building is enumerated a label will be pasted upon it so that a check can be made, and a further check will be made by the Quartermaster's lists of buildings and the property lists.

The first census of the Canal Zone was taken from March 3 to June 23, 1908, and showed the population to be 50,003 of whom 24,296 were employed on the Canal or railroad work. This did not include the employes living in Panama and Colon. The whites numbered 14,635, the blacks 34,785, and the yellow 583.

Reduction of Force at Gatun.

As the construction of Gatun Locks, over 88 per cent of the concrete for which is in place, nears completion some of the employes are being notified that their services will soon no longer be required. Six gold employes, foremen and general foremen, have been informed in writing that their work at Gatun will be finished by the first of March, and the suggestion is made that they try to arrange for transfer to other parts of the construction. The silver roll has also been reduced and further reductions on both gold and silver rolls will be made about the first of March.

RECORD OF CANAL WORK SINCE AMERICAN OCCUPATION.

MONTHLY TOTALS BY CUBIC YARDS OF EXCAVATION AND LOCK AND DAM CONSTRUCTION.

[All figures are of work useful for the completed Canal.]

ERECTING LOCK MACHINERY.

Construction of Device for Operating Miter Gates.

The first of the machines for operating the miter gates in the locks has been received and the work of erecting it at upper guard gate No. 38, in the middle wall of the east upper lock at Gatun, is advancing. A description of the mechanism for opening and closing the lock gates was published in The Canal Record of April 20, 1911.

The part that is being erected now is the crank gear or large wheel shown in the illustration (*A*) herewith, and the machinery by which motion is transmitted from the motor to the wheel. The wheel and machinery are made by the Wheeling Mold and Foundry Company, the William Todd Company sub-contractors for the machine work; but the motors are purchased under a separate contract, to be made with the manufacturer that supplies the best motors, as determined by the tests now in progress at Gatun.

In operating, the wheel turns through an arc of 197 degrees, giving to the strut or connecting rod the movement of an arm in opening or closing a door, and the gate is opened or closed by this pull or thrust. The wheel is mounted upon a center plate, embedded in the lock wall and anchored into it by twelve bolts, 11 feet long and 2¼ inches in diameter. This plate is of cast steel 6½ feet square and weighs 13,200 pounds. It must be placed with great nicety because upon it depends the relation of the wheel to the gate, and the joining of the two by the connecting rod or strut.

The wheel itself is 19 feet 2 inches in diameter and is constructed of cast steel in two sections. The section containing the pin to hold the strut is heavier than the other, the weights being respectively 19,500 and 15,800 pounds. The wheel bears upon the center plate and upon four bearing wheels mounted in the wall and supporting the bull wheel at its rim, as indicated (c) in the drawing (*A*) herewith. It is then fixed to the plate by a steel forged center pin, 4 feet 8 inches long, 18 inches in diameter, and weighing 4,090 pounds. This pin contains a slot near the bottom which, when the pin is in place, is opposite similar slots in the center plate. A steel pin key is driven through the slots, thus holding the center pin firmly in place in the bed plate. Below the key slots in the center plate is a similar slot into which the bottom of the center pin projects slightly. The pin key driven through this slot will loosen the center pin enough so that it may be removed without special effort. This key itself is 4 feet long, and one foot at greatest width.

SOCIAL LIFE OF THE ZONE.

Women's Clubs.

Preparations for the annual meeting of the Canal Zone Federation of Women's Clubs are about completed. The meeting will take place at Cristobal on January 27. It is expected that the speakers for the afternoon will be Mrs. Ruth Litt, Chairman for the committee on Drama for the New York State Federation, and Mr. Frank A. Gause, Superintendent of the Canal Zone schools. Through the courtesy of the Panama Railroad Company, transportation has been granted to all club women on a special coach to be attached to the rear of the train leaving Panama at 6.30 a. m. The business meeting will be called at 9.30 a. m. Invitations have been sent to the 13 organizations of women in the Canal Zone for the afternoon meeting, and a limited number of passes will be extended to such members of these organizations as are desirous of attending the meeting. These guests of the Federation will arrive at Cristobal at midday, and the afternoon meeting will convene at 2.30 o clock. Presidents of the clubs, the custodian and librarian, and the chairmen of committees are requested to have their reports in writing to present at the business meeting. There will be an election of officers for the coming year.

The Empire Woman's Club held a business meeting on Thursday, January 4. Three new members were admitted to the club. The next meeting will be held on January 18 at Las Cascadas.

There will be a meeting of the Gatun Woman's Club at Gatun on Thursday, January 11, when the quarterly election of officers will be held.

At the semi-annual election of officers in the Paraiso Club on Wednesday, January 3, it was unanimously voted to return the following officers for the remainder of the year: President, Mrs. C. E. Hennigh; vice-president, Mrs. H. Bain; secretary, Mrs. W. M. McIntyre; treasurer, Mrs. Ruggles. The next meeting will be held on January 17, when Miss Alice Alexander, supervisor of primary grades in the Canal Zone schools, will be the speaker.

Church Work.

The monthly meeting of the Isthmian Ministers' Association was held in the Baptist Church at Culebra on Monday, January 8, at 2 p. m. The speakers were the Rev. E. G. Cooke, who gave a review of the book, "Theology and the Social Consciousness", by President King of Oberlin College, Ohio, and the Rev. J. C. Elliott, of Albany, a retired minister of the Presbyterian Church, who gave a retrospective view of his work of forty years in the ministry. The Association has taken up book reviews for the programs at its meetings. In December, at the meeting held at the Methodist Episcopal Church in Panama, the Rev. Charles O. Purdy, of Gatun, reviewed "The Preacher," by Professor A. S. Hoyt of Auburn, N. Y., and the Rev. Mr. Ports, of Panama, reviewed "The Work of Preaching", by the same author.

In the Commission chapel at Las Cascadas, preaching services are maintained every Sunday evening, the Rev. Charles Ports preaching twice in the month, the other speakers being provided by the Young Men's Christian Association. Beginning in February, a series of Tuesday evening services will be held, the preachers in charge to be the Revs. Carl H. Elliott, of Cristobal, Charles O. Purdy, of Gatun, and A. A. Nellis, of Empire.

The last services held in the Commission chapel at Culebra were on Sunday, January 7, when the Bishop of Cuba celebrated the Holy Communion at 8 a. m. The Sunday school was as usual at 9.30 a. m. and preaching services were held in the evening by the Rev. A. A. Nellis. The demolition of the building, made necessary by the encroachment of the Canal, was begun on the following day. The Culebra chapel was constructed in June, 1907, and was the fifth of the type to be erected after the authorization for such buildings by the Commission. The building will not be reconstructed.

The Cristobal Union Church expects to move into its new building in about a month. The building is a laborers' barrack which has been removed from Camp Bierd and will be reconstructed for church purposes on the triangle facing the old church building, now the court house. The interior of the building will be partitioned off into suitable class rooms for the Sunday school, leaving an auditorium with a seating capacity of about 300.

The Christmas cake sale held by the American Woman's Altar Society of St. Ferdinand's Church, Empire, netted about $25. On New Year's Day the Altar Society composed of West Indian and native women held an elaborate bazaar at which the receipts were $115. The regular monthly dance of the Men's Catholic Club was held in Kangaroo Hall on Saturday evening, January 6.

The Rt. Rev. Albion W. Knight, D. D., the Bishop of Cuba, sailed for Havana on January 11, after a visit to the Isthmus which extended over a period of two weeks. During that time he visited 11 missions of the church, confirmed more than 200 persons, ordained one candidate for priest's orders, and consecrated the church at Empire which was erected by the American residents of the village in 1908.

Red Cross Reception.

In connection with the public reception to be given to Miss Mabel T. Boardman, Chairman of the Executive Committee of the National Red Cross, on Saturday evening, January 13, in the National Theater at Panama, Red Cross tickets will be honored for transportation on trains Nos. 7 and 71, leaving Colon at 4.35 and 6.00 p. m., respectively, and for returning on train No. 64, leaving Panama at 11.50 p. m.

The recently elected officers for the ensuing term in the Isthmian Canal Rebekah Lodge No. 1, Gorgona, will be installed at the next regular meeting of the lodge on Friday evening, January 12. All Rebekahs in good standing are invited to be present.

Visit of The American Institute of Electrical Engineers.

The following program has been arranged for the entertainment of the members of the American Institute of Electrical Engineers on the occasion of their visit to the Isthmus, January 25 to February 1:

Thursday, January 25—New Orleans party due to arrive at 6 a. m.; New York party due to arrive 1 p. m. Both parties to be taken from Colon to Panama on a special train leaving Colon immediately after arrival of second party. The first party to arrive will make its headquarters aboard ship until the arrival of the second party. If the schedule of boats is not changed to bring their times of arrival close together, it is suggested that the party arriving first occupy the time waiting for the second party in sight-seeing in Colon and Cristobal, including inspection of the Commission hospital at Colon, cold storage plant at Cristobal, marine shops and dry dock at Cristobal, Quartermaster's Depot at Mount Hope, laborers' quarters at Camp Bierd.

Friday, January 26—Morning—Special train to leave Panama promptly at 8 a. m. Enter Culebra Cut at the south end, pass through the 8½ mile Cut, and go out on the 25-foot berm at the north end. Cross the Chagres River on Gamboa Bridge and continue over the tracks of the relocated Panama railroad, making a stop en route at the principal manufacturing and repair shops of the Commission at Gorgona. After visiting Gorgona shops, the party will be taken to Culebra where the relief maps and models of locks and dams in the Administration Building will be viewed, and the Culebra Cut viewed from the top of the hill; after which the party will be taken by special train to Empire and will lunch at the Commission hotel there. After lunch the Cut will be viewed from the Suspension Bridge, at Empire, and then the party will be returned to Panama to carry out the program for Friday afternoon.

Afternoon—Visit to Ancon Hospital and environs.

Saturday, January 27—Special train will leave Panama at 8 a. m., proceeding over the main line of the Panama railroad to Gatun; the morning to be spent at Gatun viewing locks, dams, spillway, power plant, reservoir, etc.; lunch at the Gatun hotel. Return over the relocated line to Frijoles, thence over the main line to Panama; Hotel Tivoli for dinner.

Evening—Reception and dance at the Hotel Tivoli by Tivoli Club.

Sunday, January 28—Trip will be taken to Taboga Island. Special train will leave Panama at 9.30 a .m. for Balboa, where party will embark on tugs which will take them to Taboga Island. Lunch will be served at the Commission's sanitarium on Taboga Island. Party will be returned to Hotel Tivoli in time for dinner.

(Note: In order to make arrangements for properly caring for the members of the party, it will be necessary to know the approximate number that expect to take the trip to Taboga, on the evening of January 26.)

Monday, January 29—Morning—Special train to leave Panama at 8 a. m. for the Pacific Division, visiting in turn Pedro Miguel Lock, Miraflores Locks, and Dam, hydraulic excavation in Canal prism and turbo-electric power plant at Miraflores, thence over the main line of the Panama railroad to Panama. Train will bring party back to Hotel Tivoli in time for lunch.

Afternoon—No special program. Individual trip to Old Panama is suggested.

(Note. A trip to the Porto Bello rock quarry and crushing plant and to the old town of Porto Bello may be taken on Monday instead of the trip by special train through the Pacific Division scheduled above, if desired. Members of Porto Bello party will leave Panama on regular Panama railroad train No. 2, at 6.30 a. m. for Mount Hope, embarking at Dock No. 13 immediately upon their arrival, on tug which will take them to Porto Bello and bring them back in time to catch the regular train which leaves Colon for Panama at 4.35 p. m. In order to make arrangements for properly caring for the members of the party it will be necessary to know the approximate number that expect to take the trip to Porto Bello on the arrival of the boats.)

Tuesday, January 30—Morning—Leave Panama by special train at 8 a. m. for Ancon quarry, thence to view operations on Balboa dump and inspect breakwater under construction to Naos Island. Return to Hotel Tivoli for early lunch at 11.15 a. m.

Afternoon—Special train leave Panama at 1 p. m. for Balboa, where marine shops and docks will be inspected. Party will embark on tugs at 2 p. m. for inspection of Canal and dredging work between Agua Dulce and the end of the Canal channel. Party will be landed at Balboa and returned to Panama by special train in time for dinner.

Wednesday, January 31—Morning—Leave Panama by special train at 8 a. m., going over the main line of the Panama railroad to Mindi, thence over the tracks of the Atlantic Division to the intersection of the French and American Canals. After inspection of excavation work at Mindi, tugs will be boarded, which will proceed down the American Canal and up the French Canal, returning to Dock No. 11, Cristobal, where the party will land and lunch at the Cristobal hotel of the Commission.

Afternoon—Party may either visit Cristobal and Colon, take a trip to Toro Point and inspect the construction of the breakwater there, or board the sea-going suction dredge *Caribbean* and take a trip on her while she is working. The party going to Toro Point or on the dredge *Carribbean* will embark at Dock No. 11 at 1 p. m. and will be returned to Cristobal in time to take special train for Panama which will leave Dock No. 11 at 4.15 p. m.

(Note. In order to make arrangements for properly caring for the members of party it will be necessary to know the approximate number that expect to take the trip to Toro Point or on the dredge *Caribbean* by January 29.)

Thursday, February 1—Special train with entire party will leave Panama for Colon at 8 a. m. The baggage should be properly marked with the ships' tags, stating name of ship and whether baggage is for the "Hold" or "Stateroom" of ship.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

GENERAL.

The following is the schedule for moving picture entertainments for the week, January 15 to 20: Monday, Corozal; Tuesday, Culebra; Wednesday, Empire; Thursday, Gatun; Friday, Gorgona; Saturday, Cristobal.

CULEBRA.

Because of the Red Cross entertainment in Panama, the smoker which was planned for January 13 has been postponed until the next week.

A Glee Club was organized two weeks ago and is planning to give a concert in March.

All men in Culebra desiring to learn how to play chess will kindly hand their names to the Secretary, and arrangements will be made.

A duck pin tournament has been organized with forty entries. This group has been divided into eight teams, and will begin the series of games this week.

A pool tournament is now being organized, and if there are any more men who want to enter, they should hand their names to the pool attendant.

The following high scores in duck pins were made during the week: Crain, 109, 106; Judge, 102, 108· Wheeler, 100; Kleane, 100; Sickler, 102; MacRae, 110; Case, 105; Mengel, 102.

EMPIRE.

A meeting of the Empire bowlers was held on Monday night, January 8, and it was decided to start a local tournament at once.

Twenty men are enrolled in the Spanish class which started on Thursday, January 4. Anyone desiring private lessons or a sufficient number wishing an advanced course in Spanish, will please make such desires known at the office.

Several men are in training for the indoor and outdoor athletic meets which are to be held January 19 and February 22, respectively.

The following high scores were bowled during the week ending January 6: Duck pins—J. King, 101; H. King, 102; Goolsby, 101; Pinney, 105, 101; Hartman, 100; Rodeighiro, 108, 103, 104; Danielson, 100; Dakin 109; Reed, 103; Myers, 105.

GATUN.

The first indoor athletic meet conducted on the Zone was held on Saturday evening, January 6, at the Gatun clubhouse. The seven men representing Gatun were Jackson, Ford, Matthews, Wright, Kerruish, Cole, and Rogers. Gorgona had eight men participating: Burns, Carpenter, Louden, Lainhardt, Charnley, Heider, Johnson, and Flynn. About 125 people attended. After the meet there was a "sociable" with music and refreshments. Miss Eva Harris of Gatun presented the winners with ribbons. The results of the various events were as follows:

Twenty-yard dash—Gatun first, Matthews, time 3 seconds; Gorgona second, Louden; Gatun third, Flynn.

Running Broad Jump—Gorgona first, Louden, distance 16 feet 6 inches; Gatun second, Matthews; Gorgona third, Carpenter.

Twelve pound Shot-put—Gatun first, Ford, distance 38 feet 8 inches; Gatun second, Rogers; Gorgona third, Carpenter.

Running High Jump—Gorgona first, Johnson, height 4 feet 9 inches; Gatun second, Rogers; Gorgona third, Lainhardt.

Pole Vault—Gatun first, Wright, height 7 feet 9 inches; Gorgona second, Heider; Gorgona third, Carpenter.

The relay race was won by the Gatun team, consisting of Matthews, Wright, Kerruish, Cole and Jackson Total points of the dual meet, Gatun, 29; Gorgona, 21

W. C. Gayer led the Drop-in-Discussion club on Sunday evening, January 7. Twenty-six men attended. The subject was "The Delusion of Faith without Works." Among those who participated were Messrs. Dillon, DeMoll, Smith, Farman, Van Vernschotin, Purdy, Dwelle, Fitzgerald, and Brown.

Arrangements are being made to have Burnsee, the champion checker player of the Isthmus, come to Gatun and play a simultaneous game with some of the local players.

During the month of December there were 15 entertainments held at the Gatun clubhouse to which the public were invited or an average of one every other night. The total attendance was 2,579. A gain of 3 was made in the membership of the clubhouse during the month of December, 1911. The total receipts at the soda fountain were $924.58.

The results of the boys' basket ball game on Saturday evening, January 6, are "Working Boys," 21; "School Boys," 20.

The handicap pool tournament which was started in November was brought to a close on Friday evening, January 5, when G. L. Hughes played off a tie and defeated C. M. Johnsoo, the latter being given a handicap of 20 balls. Hughes won by a single ball, making 80 balls to Johnson's 59. As a result of this game Hughes won the tournament and Johnson got second place. C. C. Jones defeated Eugene Miller in a tie game and thereby won third place. The prizes are gold medals for first and second places and a silver medal for third. Mr. DePoorter will donate a booby prize. The standing of the players when the tournament closed was:

Name.	Won.	Lost.	No. balls played.
Hughes	13	1	80
Johnson	13	1	60
Jones	11	3	60
Miller	11	3	60
Galloway	7	7	65
Bailey	10	4	65
Tounsley	8	6	60
Shailer	9	5	60
McKay	4	10	50
Sherrard	4	10	50
Coleman	7	7	60
Louner	1	13	75
Lenow	7	7	50
Myers	5	9	60
Harrold	0	14	50

Mr. DePoorter will play Mr. Hughes on Friday night, January 12. The former will play 150 balls to the latter's 110. A three-cushioned billiard tournament will start in the next few days with ten entries.

CRISTOBAL.

Five hundred and eighty people attended the band concert by the Camp Elliott Band on Monday evening, January 1.

Two hundred and sixty-five people were present at the moving picture show on Tuesday evening, January 2. The next in the series of moving pictures entertainments will be given on Friday evening, January 12.

The Spanish class is being orgainzed and will hold its first regular session on Monday evening, January 15. Any member of the Association, desiring to join the class, may do so by paying $2.50 for ten lessons. The hours of the session will be from eight to ten in the evening.

All members interested in indoor baseball should begin practice this week. The nights set aside for practice are Monday, Wednesday and Friday, ordinarily. It is expected that there will be practice for the rest of the season three nights a week.

On Wednesday evening, January 17, the literary and debating club will present an open program to which both men and women are cordially invited. The feature of the program will be an address by Commissioner Maurice H. Thatcher, Head of the Department of Civil Administration. After the program refreshments will be served.

WEATHER CONDITIONS, CANAL ZONE, DECEMBER, 1911.

Typical dry-season weather prevailed during the month in all sections of the Canal Zone. The rainfall was the lightest of record for the month of December at all stations except Ancon, Gamboa, and Colon. The average over the Pacific section was 24 per cent of the normal and over the Central and Atlantic sections 12 and 14 per cent respectively.

The average temperature was well above normal, being the highest of record for December at each of the three meteorological stations, while the average relative humidity and atmospheric pressure at all stations were the lowest of record for December. The atmospheric pressure reading at 29.628 inches at Ancon on the 19th is the lowest sea-level pressure that has been observed in the Canal Zone since American records have been kept.

There was a general deficiency in cloudiness over the Isthmus and a marked excess in wind movement.

OFFICIAL CIRCULARS.

Assistant Engineer in Charge of Construction of Fortifications.

CULEBRA, C. Z., December 30, 1911.

CIRCULAR NO. 427:

Effective January 1, 1912, Lieut. Geo. R. Goethals, U. S. A., is appointed Assistant Engineer in charge of construction of fortifications, reporting directly to the Chief Engineer.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Reduction of Force—European Laborers.

CULEBRA, C. Z., January 6, 1912.

CIRCULAR NO. 192-A:

It is directed that whenever it may become necessary to discharge ten or more European laborers the Chief Quartermaster be notified by telephone, or otherwise, and that the men be held on the work until his representative can see them and arrange either for their employment elsewhere or their repatriation.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Broken Staybolts.

CULEBRA, C. Z., January 6, 1912.

HEADS OF DEPARTMENTS AND DIVISIONS:

Circular No. 259-A, issued December 27, 1911, in regard to locomotive engineers plugging broken staybolts, is corrected to read Circular No. 259-B.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Responsibility of Traveling Engineers.

CULEDRA, C. Z., January 4, 1912.

CIRCULAR NO. 266-1:

The following rules will hereafter govern the determination of responsibility of Traveling Engineers when riding locomotives in the course of performance of their duties:

1. When the Traveling Engineer is merely running an engine to demonstrate a higher efficiency to the engineer he will be responsible only for the proper and safe handling of engine and train, the engineer to continue responsible for observance of rules, rights and orders pertaining to the train movements.
2. When the Traveling Engineer relieves an engineer, same shall be accompanied by an official transfer of all orders and instructions pertaining to the train movements, the same as in exchange of engines by engineers, and in this case the Traveling Engineer then assumes all responsibility.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Accountability for Locomotive Equipment.

CULEBRA, C. Z., January 5, 1912.

CIRCULAR NO. 411-B:

Difficulty in properly fixing property accountability for locomotive equipment has been encountered on account of locomotive engineers leaving personal tool equipment on locomotives which becomes checked with I. C. C. equipment. In order to keep property records accurately, locomotive engineers will in the future confine their personal tool equipment to such tools as are not furnished by the Isthmian Canal Commission. Any duplication by locomotive engineers of standard tools furnished by the Isthmian Canal Commission or the Panama Railroad Company is prohibited.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Hose for Cleaning Floors.

CULEBRA, C. Z., January 6, 1912.

CIRCULAR NO. 365-C:

The use of hose for the purpose of cleaning wooden floors in buildings of the Isthmian Canal Commission or of the Panama Railroad Company, other than stables, is prohibited.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Contracts for Clearing Trails.

The bids will be received by the Purchasing Agent on the Isthmus, Isthmian Canal Commission, Mount Hope, Canal Zone, until 2:30 p. m., Friday, January 19, 1912, at which time they will be opened in public, for the clearing of the following trails: Cruces-Gamboa and Mount Hope-Majagual. Work shall be done in accordance with specifications to be obtained upon application to the Superintendent of Public Works, Isthmian Canal Commission, Administration Building, Panama. Proposals may be made for clearing each trail separately, or for both. Successful bidders will be required to furnish a bond or make a cash deposit in the sum of ten per cent of the amount bid as a guarantee that the work will be carried out. Proposals should be enclosed in a sealed envelop, marked "Proposal for Clearing Canal Zone Trails," and addressed to the undersigned. The Commission reserves the right to reject any and all bids, or accept any bid, as may be deemed to its interest, and to waive defects and informalities in proposals.

C. NIXON.
Purchasing Agent on the Isthmus.

Stages of the Chagres.

Maximum heights of the Chagres River for the weeks ending midnight, Saturday, December 30 and January 6. All heights are in feet above mean sealevel.

Hamburg-American steamers leave Colon for New York via Kingston at 10 a. m. on sailing dates. The *Prinz August Wilhelm* and *Prinz Eitel Friedrich* call at Santiago de Cuba, on both outward and homeward voyages. The *Altai* cabins are all sold at second cabin rates.

Royal Mail steamers leave for New York on alternate Tuesdays, at 10 a.m.; for Southampton on alternate Tuesdays at 10 a. m.

United Fruit Company's ships for New Orleans direct, leave on Thursdays at 3 p. m.; ships for New York via Kingston on Thursdays at 11 a. m.; for Bocas del Toro on Mondays at 6 p. m.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, JANUARY 17, 1912. No. 21.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Removal of Track at Pedro Miguel.

Work on the center and west side walls of the lock at Pedro Miguel having been practically completed, the removal of the inclined trestle in the west chamber, carrying narrow and 5-foot gage tracks from the upper to the lower level, has begun and the chamber will be cleared of debris to facilitate the erection of the gates. The grade of the trestle is $3\frac{1}{3}$ per cent and its length is slightly over 1,000 feet. Most of the timber is in good condition and will be transferred to Miraflores Locks for trestle work.

Automobile Fire Apparatus.

Award has been authorized to the Webb Motor Fire Apparatus Company of St. Louis for two automobile fire pumps and trucks for $8,000 each. These are the machines authorized, one for Cristobal and one for Ancon, a description of which was published in THE CANAL RECORD of October 25, 1911. The automobiles must be capable of running 20 miles an hour up a 12 per cent grade or 50 miles an hour on level roads. The pumps will have a capacity of not less than 700 gallons a minute against a pump pressure of 120 pounds, and their parts will be so made that they can pump muddy salt water without corrosion or deterioration.

Requisition has been made for the purchase of an automobile tractor and a supplementary pair of wheels with transmission axle, to be substituted for horses for drawing the No. 3 Silsby fire-engine at Cristobal. The tractor will consist of a 40-horse power, 4-cylinder, gasoline engine, mounted by means of a vanadium steel fork over a heavy hickory wheel, about 32 inches high and capable of being turned through an angle of 85 degrees to guide the apparatus. The engine, which will be water-cooled, is to be equipped with a double ignition system, in which a magneto will be supplemented by an induction coil with batteries, and to have gears for three speeds forward and one reverse. It is to be capable of drawing the fire-engine, which weighs 7,000 pounds, 25 miles an hour on a level road and 10 miles an hour up a 10 per cent grade. Pumping at fires will be done by the steam engine of the present equipment, and not by the gasoline engine, as in the case of regularly built automobile fire-engines. It is estimated that the chauffeur can stoke the steam engine, thus doing away with the employment of one man, whose salary would be $1,500 a year; this, with the economy of automobile over horses, aggregates a yearly saving of about $1,922, according to a report of the Fire Chief. The estimated cost of tractor and new front wheels and axle is $2,875, which would be reduced by the sale of the team of horses now in use with the fire-engine.

Voyage of the Corozal.

The ladder dredge *Corozal*, which left Falmouth for Panama via the Strait of Magellan on December 1, but had to turn back because of heavy seas which stove in five frames at the forecastle above the water line, has been repaired and made a second start on December 29.

Upper Approach Wall at Pedro Miguel.

In the construction of the upper approach wall at Pedro Miguel Lock, about 5,000 cubic yards of concrete, out of the requisite 30,000 yards, have been laid. The wall will be cellular, consisting essentially of two side walls, varying in thickness from 27 to 14 inches, connected at intervals of fifteen feet by transverse vertical walls, or counterforts, 18 inches thick. The top will be covered with reinforced concrete flooring, in which will be laid the rack and return tracks for the towing locomotives.

The foundation for the structure is the rock bottom of the upper approach channel, which is in effect a part of Culebra Cut. Each side wall will be based on a level bottom slab, 4 feet wide, with its thickness varying with the contour of the rock on which it rests. The surface of the slab is at 37 feet above sealevel and the wall will rise 62 feet above it, so that the top is to be 14 feet above the normal level of the water in the approach channel. The lower portions of the side walls are being heavily reinforced, having 70-pound rails placed vertically at intervals of 6 feet, with connections of twisted steel bars. The outer faces will be vertical and the distance between them, that is, the thickness of the completed wall, is to be 58 feet. The wall will be solid for a distance of about 30 feet from the upper end and will run for a distance of about 1,154 feet to the point at which, hypothetically, the approach wall joins the center wall, the two being in effect continuous. Between these solid portions, the side walls will be joined every fifteen feet by counterforts, resting on rock and rising to the height of the side walls. In construction, the space between two counterforts is bridged by an arch of planks, on which the concrete is dumped for distribution, as it would be impracticable to fill the narrow forms separately from the 2-cubic yard buckets in which the concrete is hauled from the permanent mixing plant over narrow-gage railroad.

Dredging at Pacific Entrance.

The time of operation of the dipper dredge and two of the ladder dredges at work in the Pacific entrance to the Canal has been cut one half, the dipper dredge now operating in two 5-hour shifts daily, and the ladder dredges in two 6-hour shifts. This half-time work is necessary because the dredges can work only from mean tide to low tide and back, the dipper dredge being incapable of digging more that 40 feet below the water and the ladder dredges 40 and 35 feet.

The dredge *Badger* has begun work in the basin in front of the lumber wharf in order that the channel up to the dock may be navigable by the time the wharf is completed. The wharf is being constructed on the land, and the basin will be dredged out up to the front of the new structure.

Borings on the site of the dry dock have been begun to determine the character of the material under the proposed foundation. On the east and west wall line of the dock and the approach basin, holes will be at 100-foot intervals, and along the center line at 200-foot intervals. The borings on the center line of the dock will go down to 65 feet below mean tide, and the larger part of the work will be through hard rock. Every third boring on the wall site will be carried down to 45 feet below mean sealevel, the others to five feet depth in rock.

The suction dredge *Culebra*, having been repaired at the shipways, resumed work in the channel on the morning of January 9.

Termination of Distillery Lease.

The lease to Antonio Andrade, a Greek resident in the Canal Zone, of a rum distillery and 23 hectares (56.83 acres) of cane land near Gorgona, has been cancelled and the movable property will shortly be offered at public auction. This action was necessitated by the advance of the Canal construction and was in accordance with the terms of the lease. Andrade's property was expropriated in August, 1908, by the United States and as provided by the treaty with the Republic of Panama, the value was adjudicated by a joint commission, which awarded the owner $90,000 for the distillery and the adjoining property known as "Hacienda Andrade." Permission was then secured from the Secretary of War to lease the property till such time as the Canal work should demand the right of way. The distillery and a portion of the adjoining land were leased to Andrade at what was termed a fair rental value: for one year from January 13, 1909, for $1,500; for the succeeding year for $300; and for one year from January 13, 1911, for $100. The decline in rental value is because of the exhaustion of the cane which was growing on

NOTES OF PROGRESS.

(Continued.)

the land at the time it was first leased. The distilling equipment consists essentially of two copper stills, of 12.25 and 18.90 litres capacity, and accessory engines, cane mills, tanks and storage houses.

Lidgerwood Unloading.

The following statement shows the number of Lidgerwood cars unloaded by the Central Division during the month of December, 1911:

LOCATION.	No. of unloaders.	No. of trains.	No. of cars.
Balboa	4	1,199	23,980
Miraflores	3	566	11,320
Gamboa	*4	1,140	23,937
Total	11	2,905	59,237

*1 unloader worked but 4 days.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 75 per cent completed, 169,088 cubic yards, out of a total of 225,000, having been placed at the close of work on January 13. A statement of the amount laid each working day last week, and of the total in place, follows;

DATE.	Concrete Laid.	Hours worked	No. Mixers.
January 8	228	7.30	1
January 9	148	4.30	1
January 10	364	13.30	2
January 11	244	16.00	2
January 12	308	16.00	2
January 13	360	16.00	2
Total	1,652	73.30	1 66
Previously reported	167,436		
Grand total	169,088		

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending January 13, follows:

DATE.	Hours worked.	Cubic Yards.
January 8	4.52	1,978
January 9	3.31	1,765
January 10	3.32	1,691
January 11	3.40	1,723
January 12	3.27	1,736
January 13	4.47	2,223
Total	23.49	11,116

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending January 13, follows:

DATE.	Hours worked.	Cubic Yards.
January 8	5.35	2,310
January 9	7.30	2,889
January 10	7.30	2,870
January 11	6.50	2,683
January 12	6.50	2,455
January 13	4.25	1,673
Total	38.40	14,880

Health Work in Colon.

The work of district nursing among the poor people of the city of Colon was resumed on January 12, two nurses of the Colon Hospital staff being detailed for the service. The city will be divided into districts as before and the principal duty of the nurses will be to combat infant mortality.

The second in the series of free health lectures for the people of Colon will begin on January 25. Dr. A. J. Orenstein, of the Department of Sanitation, will speak on the fly as a carrier of disease. A new set of films will be exhibited. The managers of this work are planning for an afternoon for mothers when a lecture on infant-feeding will be given. The lecture will be illustrated by drawings and will show sanitary methods of preparing the evaporated milk and other infants' foods obtainable on the Isthmus. The lecture will be given by a doctor of the Colon Hospital staff and one of the district nurses will be present.

CONCRETE WORK IN THE LOCKS.

Over 76 per cent of the concrete for the locks is in place, the amount at the close of work on January 13, being 3,193,425½ cubic yards, out of a total of approximately 4,199,400. A total of 22,619½ cubic yards of concrete was laid in the locks during the week ending January 13.

GATUN LOCKS.

Over 89 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on January 13, being 1,781,516½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending January 13, and of the total, follows; and a similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone	Total.

LAWN TENNIS.

Schedule and Rules for Isthmian Association Tournaments.

At a meeting of the Isthmian Tennis Association held at the University Club on January 7, the following schedule of tournaments was decided upon, and the following rules covering same were adopted.

Date.	Place.	Class.
January 14	Empire	Doubles
January 28	Cristobal and Gatun	Singles
February 11	Tivoli (Ancon)	Doubles
February 22	Panama	Singles
March 3	Gatun and Cristobal	Doubles
March 17	Ancon (Hospital)	Singles
April 7	Culebra	Doubles
April 21	Panama (Maduro-Lupi Cup)	Doubles
May 12	Empire	Singles
May 30	Ancon, Tivoli, and Panama	Doubles and Singles
June 16	Open	Singles

The tournament of May 30 to be open to any member of an Isthmian League club. Winners to be known as champions of the Isthmus of Panama for 1912. If not completed on May 30, to be finished on the three courts named on June 2. Entrance fee of $1.00 for each player for this tournament only.

Clubs shall be eligible to representation by one player in singles and on team in doubles in each of the Association tournaments for the season of 1912, on payment of a season fee of $10.00. except for the Isthmian Championship tournament for which an entrance fee of $1.00 will be charged each contestant.

The tournament of April 21 shall be named the Maduro-Lupi Tournament, and the winning club shall become custodian of the Maduro-Lupi Cup for 1912 under the terms upon which it was presented.

Each match shall consist of best two out of three sets. A recess of seven minutes may be allowed at option of either player between second and third sets.

Players shall report to the committee at the courts ready for play at 9 a. m. (due allowance being made for trains arriving about that time), and thereafter may not leave except on excuse from a referee, no excuse to be allowed which may interfere with the progress of the tournament. Drawing for places shall be made, and play shall begin as promptly after 9 a. m. as possible, and play shall be continuous, provided that play may be stopped at option of any player after 5 p. m.; and provided also that time for midday meal, not exceeding two hours, shall be allowed by the referee, depending on the progress of the play. No player shall be obliged to engage in a match within one hour from a preceding match in which he was contestant.

In case a tournament is not completed on day of date scheduled, it shall be continued on the succeeding Sunday on the same courts and with the same contestants.

The following have been elected by the board to serve as referees for the season of 1912: Mr. Pulsifer, Judge Blackburn, Mr. Hoyte, and C. Melhado. Their duties shall be to appoint umpires and linemen, have general charge of tournaments, and report results of matches to the Secretary. A referee for each tournament will be designated by the secretary from the above.

Where any of the above rules may conflict, rules of the U. S. N. L. T. A., for 1911, shall govern.

It is expected that there will be clubs in the Association as follows: Panama, Ancon, Tivoli, Corozal, Culebra, Empire, Tenth Infantry, Gorgona, Camp Elliott, Gatun, Cristobal, Colon.

At the lawn tennis tournament at Empire on January 14, Empire won three matches with the loss of but one set. There were five teams represented with the following results: Preliminaries—Empire defeated Cristobal, 11-9, 6-4; Ancon defeated Culebra, 6-4, 6-3. Semi-finals—Empire defeated Tivoli, 6-4, 8-6, and in the finals defeated Ancon, 6-4, 4-6, 6-3.

Canal Zone Schools in December.

During the month of December, 1911, the average daily attendance at the schools maintained by the Commission for white children was 977.2, or 84.2 per cent of the net enrollment, which was 1,161. In the colored schools the average attendance was 703.9, or 62.0 per cent of the net enrollment of 1,135. A total of $68 for tuition of children of white non-employes of the Commission or the Panama railroad, not living in the Canal Zone, was collected at the Ancon and Cristobal schools. The medical inspection of the pupils in the white schools at Paraiso and Bas Obispo was made during the month by the respective District Physicians. This completes the medical inspection of all schools except those at Las Cascadas and Ancon, where delay has been occasioned by changes of the physicians. From statistics available it is estimated that the total expenditures for the fiscal year commencing July 1, 1911, amounted at the close of the year 1911 to $43,000.

Postals Savings Banks.

The Postal savings bank system for the Canal Zone, authorized in Executive Order dated September 8, 1911. details concerning which were published in THE CANAL RECORD of November 22, has not been established on account of the failure to arrive of necessary forms, certificates and the like from the Post Office Department offices in Washington. These blanks were shipped from New York on January 15, on the steamship *Allianca*, due to arrive at Cristobal on January 21, and it is the expectation of the Canal Zone Department of Posts and Revenues to have the system in operation by the latter part of this month.

LABOR FORCE AND QUARTERS IN DECEMBER.

The total force at work on the Canal and Panama railroad at the close of December, 1911, was 37,826, the second largest force employed since the canal work was begun, the largest being that at the close of March, 1910, when the force numbered 38,676. The force for November, 1911, was 37,590, for December, 1910, 35,132; for December, 1909, 35,435.

QUARTERS.

On January 1, there were 25,105 occupants of Commission quarters. Of these, 9,167 were white Americans of whom 5,188 were men, 2,067 were women, and 1,912 were children. There were 6,358 Europeans of the laborer class, of whom 5,696 were men, 271 women, and 391 children. There were 9,580 West Indian negroes, of whom 7,202 were men, 1,070 women, and 1,308 children. Included in the above were 301 Asiatics, and 87 Panamans.

STEAMSHIP SERVICE.

Increase in Regular Service.—Cruises for Tourists.

The United Fruit Company announces the inauguration of a semiweekly steamship service between New York and Colon. Beginning with the departure from New York on January 6 of the *Tivives*, which arrived at Colon on January 13, the weekly service will be augmented by the use of three new ships and a schedule of departures from New York on Wednesdays and Saturdays, with arrivals at Colon on Thursdays and Saturdays, will be put into effect. From Colon the sailings for New York are to be on Tuesdays at 1.30 p. m. and on Thursdays at 11 a. m., with arrivals in New York on Tuesdays and Thursdays, respectively, a week later. The weekly service between New Orleans and Colon will continue as heretofore. The line is preparing to transport a number of parties of tourists and professional persons to and from the Isthmus during the dry season.

An agent of the Royal Dutch West India Mail Steamship Company has recently made a visit to the Isthmus for the purpose of investigating conditions in Colon to the end that the company may make that city a port of call for ships en route to New York from the Netherlands by way of Curaçao.

The Hamburg-American Line will conduct, in addition to its regular service, special tourists' cruises, sailing from New Orleans and New York. The *Fuerst Bismarck*, a vessel of 9,500 tons, 468 feet long and 55 feet beam, with a speed of 15 to 16 knots, will leave New Orleans on January 18, with about 225 tourists, members of the Illinois Manufacturers' Association, with their wives and daughters. The party is due to arrive at Colon on January 24 and to leave on January 25.

Anent the cruises to the West Indies for the year 1912, which were scheduled to be made by the *Moltke* and the *Hamburg*, 12,000 tons each, the demand for accomodations aboard these steamers has so surpassed expectations that the line has found it necessary to replace the sailings of the *Hamburg* by the *Victoria Luise* (16,500 tons), said to be the largest cruising steamer in the world, and the largest vessel that has ever been in the West Indies. This vessel, formerly the *Deutschland*, has lately been remodelled and converted into a cruising steamer. The *Victoria Luise* is 663 feet long and has accomodations for 500 to 550 passengers, all of whom can be seated at one time in the dining saloon. The *Victoria Luise* will call at Colon on February 20 and March 20.

Besides the cruises to be made by the *Victoria Luise*, the *Moltke* will call at Colon on February 5 and March 8, with about 350 passengers on each cruise, and the *Bluecher* will call at Colon, April 3, with about 250 passengers.

The line of the Royal Mail Steam Packet Company between Southampton and New York, by way of the West Indies and Colon, will not be increased in its regular service; but the twin-screw cruising yacht *Arcadian*, designed especially for the use of tourists and carrying very little freight, left Southampton on January 3, with all accommodations taken. Some of the passengers will disembark at Jamaica and the company is advertising that the *Arcadian* will sail from Colon for Jamaica, Cuba and New York on January 23. The vessel accommodates 434 passengers.

The White Star Line and the Red Cross Line, which have no regular service to the Isthmus, will conduct special tours as follows: the *Stephano*, of the Red Cross Line, will sail from New York on January 27, for a cruise of the Caribbean Sea, including a stop for inspection of the Canal Zone; the White Star Line will conduct two tours through the Spanish Main, leaving New York on January 20 and February 24 on the *Laurentic*, a triple screw vessel of 14,892 tons.

Red Cross Meeting.

A reception tendered by the Canal Zone Chapter of the American National Red Cross to Miss Mabel Boardman of the Central Committee, at the National Theatre, Panama, on Saturday evening, January 13, was attended by a large number of Red Cross members from the Zone and Panama. Col. Geo. W. Goethals and Miss Boardman were the speakers. In addition, there were musical numbers by a quartette consisting of Mrs. A. S. Boyd, Mrs. G. R. P. Kramer, and Messrs. W. S. Ross and E. Paul Case, with Mr. A. B. Dickson at the piano, and violin selections by Mr. George Arnold, accompanied by Miss Dorothy Layland. The band of the Tenth Infantry also played.

Red Cross Finances.

A financial statement of the Canal Zone chapter, American National Red Cross, for the month of December, follows:

	RECEIPTS.		
December	1, On hand	$2,006.75	
December	15, Donated by Mr. J. McGregor	1.50	
December	29, Receipts from sale of Red Cross Christmas Seals	245.18	
December	30, Interest credited at bank	3.23	
December	31, Membership dues received during month	11.00	
Total receipts			$2,267.66
	DISBURSEMENTS.		
December	6, Relief of Colon Fire Sufferer	$25.00	
December	6, To Mr. Poole, express on supplies	1.05	
December	9, Supplies and printing	9.13	
December	15, Relief of Zone prisoner, deported	10.00	
December	20, Relief of Colon Fire sufferer	25.00	
Total disbursements			$70.18
December	31, Balance on hand		$2,197.48

C. A. DEVOL, *Chairman and Acting Treasurer.*

CIVIL SERVICE AND POLITICS.

Resigning with Hope of Reinstatement after Campaign.—Announcement of Examination.

The Civil Service Commission submitted to the President certain propositions for instructions, and has received the following reply:

THE WHITE HOUSE,
Washington, D. C.
December 26, 1911.

Gentlemen:

I have your letter of December 21st, and answer your questions categorically.

I am of opinion that in accord with the spirit of our institutions in recognizing the fundamental right of citizenship, a citizen who resigns to become a candidate for office and pursues a course free from coercion, bribery, or other scandalous or unlawful conduct should not thereby be prejudiced by being refused reinstatement within the period of eligibility prescribed by the rules, nor do I think any distinction should be made between the person who resigns and becomes a candidate and one who resigns, not to be a candidate, but to manage or take part in a political campaign for a party. If he wishes to run the risk of finding an Executive who will reinstate him, and he resigns in order to avoid a violation of the rules as to participation in electoral contests by members of the Classified Service, I do not see why it should demoralize the service to allow him to resign and run the risk of securing the approval of his reinstatement by the Executive within a year after he has resigned.

Sincerely yours,
WM. H. TAFT.

The Civil Service Commission,
Washington, D. C.

Civil Service Examination.

Examination for the position of immigrant inspector, Immigration Service, will be held at Culebra probably on February 25. The supply of the announcement of this examination which was received in this office was only sufficient to supply one each to the seven Commission clubhouses and the bulletin board of the Administration Building at Ancon. Intending applicants should consult one of the announcements for information in regard to the examination to avoid unnecessary correspondence. Applications must be received not later than February 2.

In answer to questions as to bona fide residence, applicants should note that such residence must be shown in a State or Territory of the United States *up to the time of the application.*

JOHN K. BAXTER.
Secretary, Isthmian Civil Service Board.

LOST—Sunday morning, January 14, at Pedro Miguel or Balboa docks, a gold K. of P. charm. A reward is offered for its return to the Quartermaster's office, Pedro Miguel.

CLASSIFIED EXPENDITURES.

A statement of classified expenditures of the Isthmian Canal Commission to November 30, 1911, follows:

PERIODS.	Department of Civil Administration	Department of Law	Department of Sanitation.	Department of Construction and Engineering	General Items.	Fortifications.	Total.

AGUA CLARA PLANT.

Filtration by Gravity Instead of under Artificial Pressure.

The new filtration plant at Agua Clara Reservoir is of a type new to the Isthmus, though it is being adopted in the States.

The raw water from the reservoir at Agua Clara passes into a mixing box, where it receives an infusion of alum, in the proportion of 1.5 grains per gallon of raw water and is mixed by passing over submerged weirs and under weirs projected from the top of the box, on its way to the sedimentation basin. In the mixing box, which is 30 feet 6 inches long by 6 feet 4 inches wide and 5 feet deep, the water is aerated by means of compressed air, from pipes set at intervals among the weirs.

In the 300,000-gallon sedimentation basin the water rests approximately three hours, after which it is drawn off to the filter beds, of which there are four, each 17 feet square, interior measurement. On the bottom of each is a bed of sand, 30 inches deep, resting on a stratum of sandstone gravel, 1 foot thick. One hundred and twenty-eight 2-inch pipes, arranged in parallel on the floor and extending the length of the tank, receive the clarified water through perforations and transmit it to a common collector pipe, from which it is passed, through a controller, to the clear water reservoir. The controller consists of a float, from which is suspended a plunger. For any designated head of water, to the level of which the float is adjusted, the float moves the plunger in a vertical plane, opening or closing ports through which water comes from the filters to the clear water reservoir. The capacity of the clear water tank is 200,000 gallons.

Water from this reservoir is forced by means of two electrically driven pumps, each of 1,400 gallons per minute capacity, into the 400,000-gallon standpipe at Gatun, from which it is distributed by gravity. The piping is arranged so that filtered water, exclusively, is used for domestic purposes and raw water from the reservoir is furnished for all plant and equipment use. The filtered water is supplied to approximately 10,000 people, in the villages of Gatun, New Gatun and Spillway. About 2,500,000 gallons may be filtered daily.

The building for the plant was constructed wholly of reinforced concrete, including the roof, which is a slab 4 inches thick and weighing about 50 pounds to the square foot. It is three stories high in the central part, with wings of one story. On the upper floor are storage rooms for resolvents; the middle is the operating floor, from which all machinery can be easily controlled; and on the ground floor are the filter beds, with the regulating devices. A bacteriological laboratory was constructed adjacent to the filter house, at a cost of $2,000. The filtration plant proper cost $38,000. It was designed and constructed by the Atlantic Division, the machinery, with the exception of rate-controllers and loss-of-head gages, having been fabricated in the States according to specifications and details furnished by the Division office.

December, 1911, Rainfall.

The rainfall during the past month was the lightest December rainfall of record at all stations in the Canal Zone except Ancon, Gamboa, and Colon, and at each of these stations it was the lightest with one exception.

The following table shows the rainfall for last month compared with the lightest December rainfall previously reported at the stations on the Isthmus having records covering a period of 10 years or longer:

STATION.	Rainfall, December, 1911.	Previous Lowest December Total.		Length of Record.
	Inches.	*Ins.*	*Year.*	*(Years)*
Ancon..........	1.99	.98	1879	*15
Balboa.........	1.36	2.80	1902	13
Culebra........	.31	.35	1900	21
Gamboa........	.97	.79	1900	29
Alhajuela.......	.39	1.14	1903	13
Bohio..........	1.34	2.88	1907	17
Colon..........	2.63	.94	1873	41

*Records have been kept intermittently at this station since 1879.

WEATHER CONDITIONS, CANAL ZONE, YEAR 1911.

The weather for the year 1911 as a whole was characterized by a general deficiency in rainfall, relative humidity, cloudiness and atmospheric pressure and an excess in temperature and wind movement.

The total rainfall during the year was below normal at all stations, being the lightest of record at Gamboa, Bohio, and a number of stations for which only a few years' records are available. The deficiencies ranged from 10 per cent at Balboa to 41 per cent at Bohio. The average fall over the Pacific Section was 67.21 inches and over the Central and Atlantic Sections 79.10 and 116.45 inches, respectively. The average number of rainy days was 172 in the Pacific Section, 214 in the Central and 265 in the Atlantic. Of the stations in the Zone, Balboa reported the least number of rainy days, 158, and Monte Lirio the greatest number, 304.

Average temperatures for the year were generally above normal. July was the warmest month at Ancon and Culebra and December at Colon.

The mean annual atmospheric pressure was the lowest that has been recorded in the Canal Zone during the past six years. March was the month of highest mean pressure and December the month of lowest pressure.

The weather conditions prevailing during the year were very favorable for excessive evaporation from water surfaces, the total amount recorded being the greatest of record at each station.

The subjoined table gives the distinctive climatological data for the year 1911:

STATIONS.	Press're (reduc'd to mean of 24 hours.)	Temperature.					Mean relative humidity.	Precipitation.			Wind.				
		Mean.	Maximum.	Date.	Minimum.	Date.		Total inches.	Annual average.	Days with .01 or more.	Aver. hourly movement (in miles.)	Prevailing direction.	Max. velocity (in miles.)	Direction.	Date

NAMES OF CANAL FORTS.

Reservations to be Named in Honor of Grant, Amador, Sherman, Randolph, and De Lesseps.

The forts of the Panama Canal, and the batteries comprising them, will be named in accordance with the following schedule. The military reservations at the Pacific terminus will be named Fort Grant and Fort Amador, the first in honor of Gen. Ulysses S. Grant, U. S. A., President of the United States from 1869 to 1877, who died on July 23, 1885, and the second in honor of Dr. Manuel Amador Guerrero, first President of the Republic of Panama, who died on May 2, 1909. The reservations at the Atlantic terminus will be named Fort Sherman, Fort Randolph, and Fort DeLesseps, in honor of Gen. William T. Sherman, U. S. A., who died February 14, 1891, Maj. Gen. Wallace F. Randolph, U. S. A., who died September 9, 1910, and Count Ferdinand DeLesseps, promoter of the Panama Canal, who died December 7, 1894.

FORT GRANT MILITARY RESERVATION.

Battery Newton, in honor of Maj. Gen. John Newton, U. S. Volunteers (Brigadier General, Chief of Engineers, U. S. A.), who died May 1, 1895.

FORT RANDOLPH MILITARY RESERVATION.

Battery Tidball, in honor of Brig. Gen. John C. Tidball, U. S. A., who died May 15, 1906.

Battery Webb, in honor of Brevet Maj. Gen. Alexander S. Webb, U. S. A. (Lieutenant Colonel, 44th U. S. Infantry), who died February 12, 1911.

Battery Weed, in honor of Brig. Gen. Stephen H. Weed, U. S. Volunteers (Captain, 5th U. S. Artillery), who was killed in action, July 2, 1863, at Gettysburg, Pa.

FORT DE LESSEPS MILITARY RESERVATION.

Battery Morgan, in honor of Brig. Gen. Charles H. Morgan, U. S. Volunteers (Major, 4th Artillery), who died December 20, 1875.

SOCIAL LIFE OF THE ZONE.

Activities of Various Organizations.

The following officers were installed in the Isthmian Canal Rebekah Lodge No. 1, Gorgona, on Friday, January 12, the District Deputy Grand Sire and Suite officiating: N. G. , Janet Martin; V. G., Mary McCann; Recording Secretary, Alfred Edwell; Financial Secretary, Henry Lotz; Treasurer, Annie Calvit; Appointive Officers—R. S. N. G., Richard Stoddard; L. S. N. G., Florence Evans; War, Clara Clements; Con., Elizabeth Parks; R. S. V. G., Stephen Calvit; L. S. V. G., Martha W. Wyatt; Inner Guard, Marie Jansen; Outer Guard, Chas. H. Beetham; Chaplain, Elenor Babbitt. These officers will serve until June 30. Meetings of the lodge are held in the lodge hall at Gorgona on the second and fourth Friday evenings in each month.

The partition between the two rooms on the second floor of the school house at Culebra has been removed and the large room thus made will be used as a meeting place for Sunday schools and church congregations.

Knights of Pythias.

At the meeting of Ancon Lodge No. 8, Knights of Pythias, held January 2, 1912, the following officers were installed for the term commencing January 1, 1912: Past Chancellor, Fred A. Feld; Chancellor Commander, Walter J. Spaulding; Vice-Chancellor, Albert M. Colegrove; Prelate, Warner H. Clapp; Master of Work, George E. Rogers; Keeper of Records and Seal and Master of Finance, Stacey C. Russell; Master of Exchequer, E. Bruce McCormick; Master-at-Arms, Edmund C. Bunker; Inner Guard, Lewis A. Smith; Outer Guard, W. Wilkes Webb.

Independent Order of Red Men.

The Independent Order of Red Men, Cholo Tribe No. 5 of Gorgona, has postponed the date of its dance from January 13 to January 27, on account of the Red Cross reception to Miss Mabel T. Boardman on the former date.

International Brotherhood of Electrical Workers.

At the regular meeting of the International Brotherhood of Electrical Workers held at Gatun, Sunday, January 14, the following officers were installed for the ensuing year: President, W. S. Mitchel, reelected; Vice-President, J. W. Smith; Recording Secretary, C. J. MacNelley, reelected; Treasurer, A. Woolnough, reelected; Financial Secretary, A. E. Thourt; Foreman, F. J. Gerchow, reelected; First Inspector, J. I. Harris, reelected; Second Inspector, A. M. Horle.

National Guard.

All men interested in the formation of a provisional regiment on the Isthmus, similar to the National Guard in the United States, will greatly oblige the undersigned by writing, stating military service, if any, army or navy. It is hoped to secure a sufficient number of men to form at least one regiment of infantry, and one mounted troop.

JOHN ABRAMSON, Empire, C. Z.

Canal Zone Rifle Club.

At the regular annual meeting of the Canal Zone Rifle Club, held on Sunday, January 14, at Pedro Miguel, the following officers for the ensuing year were elected: President, F. W. Walraven; Vice-President, F. A. Gill; Secretary, G. C. Ferris; Treasurer, A. K. Evans; Executive Officer, W. L. Greene.

Any employe of the Isthmian Canal Commission desiring to join the club may secure particulars by writing to the Secretary, G. C. Ferris, Pedro Miguel.

Ancon Rifle and Revolver Club.

The Ancon Rifle and Revolver Association has opened a range at Sosa Hill where targets have been erected at 15, 25, 50, and 75 yard distances. A building has been erected and in front of it is a platform from which the marksmen shoot. The first match, to qualify, will be held next Sunday. The Association has joined the American Revolver Association, and the National Rifle Association.

Obituary.

Frank C. Grigsby of Starr, Ohio, an employe of the Commission at Las Cascadas, died on January 1. He was 46 years of age and had been on the Isthmus four years. He is survived by his wife living at Las Cascadas.

James Luther Horham, postmaster at Paraiso, died in Ancon Hospital on Monday, January 15. He was twenty-three years of age, single, and had been on the Isthmus a little over two years, coming here from Lincoln, Neb., where his mother lives. He had been at Paraiso since July 29, 1911; previous to that date he was located at Ancon, Balboa, and Pedro Miguel. Funeral services were held at St. Luke's Church, Ancon, Tuesday, at 4 p. m., Chaplain Brown officiating.

Notice to Mariners.

Material is being dumped along the axis of the Toro Point Breakwater at the Atlantic entrance to the Canal between the end of the trestle and the white can buoy which carries a light about 12 feet above sealevel. A maximum depth of 27 feet at mean tide is available over the shoal thus formed. The buoy referred to is moved outward from time to time as the construction of the breakwater progresses and it would be well for ships to keep entirely outside of the buoy at all times.

Missing Man.

Anyone having information regarding the whereabouts of Pedro Budinich, who was on the Isthmus during June or July of last year destined for Lima, Peru, and who is thought still to be on the Isthmus, is requested to communicate with Miss Dolores M. Hernandez, 638 Prospect Place, Brooklyn, N. Y.

PERSONAL.

Mr. C. M. Saville, who has been assistant engineer in charge of the Third Division of the Office of the Chief Engineer, has resigned from the Canal service to become chief engineer in charge of the construction of dams to impound river water for the supply of the city of Hartford, Conn.

Mr. S. B. Williamson sailed for the States on official business on January 9, on the *Colon*.

Mr. E. A. Drake is a passenger on the *Cristobal*, due to arrive at Cristobal on January 17.

Col. H. F. Hodges is a passenger on the *Allianca*, due to arrive at Cristobal on January 21.

Mr. F. H. Cooke, Civil Engineer, U. S. N., has been detailed to duty under the Isthmian Canal Commission in connection with the construction of the dry dock at Balboa and other terminal work. He arrived on the Isthmus on January 9.

OFFICIAL CIRCULARS.

Acting Division Engineer, Pacific Division.

CULEBRA, C. Z., January 8, 1912.

CIRCULAR No. 428:

Effective January 9, 1912, Mr. John M. G. Watt will act as Division Engineer, Pacific Division, during the absence of Mr. S. B. Williamson.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Ratings and Rates of Pay.

CULEBRA, C. Z., January 9, 1912.

CIRCULAR No. 299-Q:

A rate of 50 cents an hour is hereby authorized for coppersmiths, iron workers, linemen, moulders, plumbers, shipwrights, tinsmiths and wiremen.

The above positions are in addition to those authorized in Circular No. 299-N, of August 21, 1911.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Sale of Stationery and Office Supplies.

Sealed bids will be received at the office of the Depot Quartermaster, Mount Hope, Canal Zone, until 2.30 p. m., January 22, 1912, when they will be opened in the presence of attending bidders. These items can be seen and examined on any working day between the hours of seven to eleven a. m., and one to five p. m., and a list can be procured upon application to this office. Bids may be tendered for any quantity of items listed. The right is reserved to reject any or all bids, or any part of a bid. Bids must be plainly marked "Proposal to Purchase Office Supplies, to be opened January 22, 1912," and addressed to the undersigned.

C. NIXON, *Depot Quartermaster.*

Family Quarters.

Applications for married quarters were on file on January 1, as follows:

DISTRICT.	List No. 1.	List No. 2.
Ancon	8 (3)	53 (16)
Ancon Hospital	1	7 (2)
Balboa		30 (6)
Bas Obispo		28 (2)
Corozal	2 (1)	53 (9)
Cristobal		122 (3)

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

GENERAL.

The schedule for moving picture entertainments for the week, January 22 to 27, inclusive, is as follows Monday, Culebra; Tuesday, Empire; Wednesday, Corozal; Thursday, Cristobal; Friday, Gatun; Saturday, Gorgona.

Friday evening, January 19, the clubhouses will hold a "Telephone" Athletic Meet. The various Y. M. C. A's., together with Camp Elliott, will enter a team, each to perform on its own floor. The first event will be run off promptly at 8 o'clock; the results from each floor telephoned to the Official Referee and Scorer, Mr. W. H. Warr, Empire. Mr. Warr will then compare results and notify the various teams along the line of the names of the winners of that event. A bulletin board will be kept in each clubhouse and the standing of teams will be posted immediately after each event. The best three men in each event will receive an appropriate ribbon souvenir and the winning team will receive a banner trophy. The order of events will be as follows: 15-yard dash; 12-pound shot put; Running high jump; Running broad jump; Three standing jumps; Eight-man relay race with poles 31 feet apart.

A Ferrand-Cecilian piano player has been purchased by the Division of Clubhouses from Captain Coleman, Adjutant of the 10th Infantry. It was used for the first time at Gorgona on Monday, January 8. There are 60 rolls of music, both popular and classical. The piano is to be used at Gorgona thirty days, after which it will be sent along the line to other clubhouses.

The Division of Clubhouses has been authorized to build an observation tower back of the Culebra clubhouse to connect with the porch of the clubhouse. The tower will be equipped with chairs, tables, etc., and will serve as a place for rest, refreshment and observation for residents and tourists.

CULEBRA.

The Duck Pin Bowling Tournament opened on Thursday evening with games between No. 2 and No. 1. The score of these and Friday's games follow:

Team.	1	2.	3.	Total.
No. 2	433	411	421	1,265
No. 1	397	389	406	1,192
Friday.				
No. 3	436	391	408	1,235
No. 4	446	432	436	1,314

High scores in duck pins for the week were made by: Coppin, 104; Driscoll, 100; Mengel, 111, 100; Coneeley, 103, 102; Fay, 106.

A smoker will be given on Thursday evening. All members and non-members are invited.

EMPIRE.

The following high scores were bowled on the alleys during the past week; Duck pins—Myers, 109; L. Giavolli, 109, 106, 100, 103, 118, 110, 112, 104; Pinney, 102, 111, 109, 102, 103; Dakin, 107, 106, 103; Goolsby, 103, 119; Grund, 101; Nelson, 104, 115; Gustaveson, 105.

The local tournament in duck and candle pins which started on Monday, January 15, has 24 entries. Each man is to bowl each of the others in both duck and candle pins. The prizes will be gold and silver medals.

At the present time the following tournaments are in progress: Bowling 24 entries, pool 24 entries, billiards 18 entries, chess 12 entries.

On Saturday, January 20, there will be an exhibition pool game by DePoorter and Hughes of Gatun, and Pearson and Hursh of Empire.

On Friday, January 26, a smoker will be given to the men of Empire. A special program is being prepared by local and out of town talent.

GORGONA.

Gorgona has 16 entries for the telephone meet to be held on Friday, January 19. At a meeting of the contestants last week they elected Messrs. A. M. Johnson and E. M. Louden as captains of two teams. The teams will be selected from the 16 entrants, and pitted against each other on the local floor to make the competition more keen.

Mrs. Murray and Mr. Gardiner furnished special music at the Camp Elliott Y. M. C. A. on Sunday night, January 14.

Messrs. Kuentz, Booz, and Hopkins furnished special music at the sunset singing service on Sunday night, January 14. Mrs. Hackenburg and Mrs. Onken sang a duet. These services are of a popular nature and everyone is welcome to attend.

The following films will be shown on Friday night at the moving picture show: A Carnival of Japanese Firemen at Tokyo; Tatalan, the Minstrel—tragic; The Cowboy's Innocence—thrilling; Will it ever come to this?—comic; A Queen for a Day—Spanish; Priscilla and the Pequot Indians—pathetic. Members admitted free, non-members 25 cents, children 15 cents.

Fifteen new books have been ordered and will be added to the library as soon as they arrive from the States. The numbering system is being revised by the librarian and will be completed in a few days.

GATUN.

The Gatun Executive Council held a special meeting on Tuesday evening, January 9. Dan St. Clair presided. Other councilmen present were Messrs. Windes, Gamble, Gayer, Shuck, and Secretary Smith. It has been decided that in the future the practice of having one's name placed on the barber shop list by telephone and the signing of one member's name on the list by another member be discontinued.

On Wednesday evening, January 17, the last lesson of the ten-lesson course in Spanish will have ended. The classes have been so successful that it has been decided to organize two more classes, one of which will take an advanced course and the other a course for beginners. Prof. Jos. Gomez will have charge. The tuition will be $2.50 for ten lessons, payable in advance. The new classes will begin on Wednesday evening, January 24.

Two new subscriptions have been added to the magazine list, the *Army and Navy Journal* and the *Official Railway Guide*. Nine new library books and ten new phonograph records were also added to the clubhouse equipment during the past week.

The game of candle pins was introduced on the Gatun alleys during the past week.

A new green tapestry curtain, ballaho, flies, drops, and wings have been ordered for the clubhouse stage.

The Spanish classes for women include the following: Class No. 1—Mrs. W. J. Allen, Mrs. F. S. Permenter, Mrs. M. R. Steele, Miss Florence Neville. Class No. 2—Miss Cora Sessions, Miss Mary Sibert, Miss Catherine Harding, Miss Josephine Reid, Miss Lucile Duckworth.

Sanitary paper towels are now used exclusively in the clubhouse.

The "School Boys" defeated the "Working Boys" in a game of basket ball on Friday evening, January 12. Score, 13 to 11.

A quartet has been organized with Coleman, 1st tenor; Langston, 2nd tenor; Smith, baritone; Dewey, bass.

The match games of pool on Friday night, between DePoorter, champion of the Isthmus and Hughes, winner of the recent pool tournament, was won by DePoorter, who gave Hughes a handicap of 40 balls. The score was DePoorter, 150; Hughes, 79.

A new Victrola talking machine will be purchased this week for the Gatun clubhouse.

The Discussion Club met on Sunday evening, January 14, with the Secretary as leader. The subject was "Vices of the Isthmus and Counteracting Agencies." Those who spoke were Foman, Bartlett, Porter, Winters, Purdy, McCollum, W. P. Smith.

CRISTOBAL.

There was an attendance of 33 at the Spanish class on Monday evening, January 8. This session was a free demonstration of the system used by Senor J. Gomez, the instructor. The regular sessions will be each Monday night hereafter for ten consecutive weeks.

There were 41 who attended the meeting of the Debating Club on Wednesday night, January 10. The subject discussed was "Resolved that the awakening of the Yellow Race is inimical to the social, political, and economic welfare of the White Race." The affirmative secured the decision. The next session of the club will be held on Wednesday evening, January 24. The programme will consist of a paper presented by J. H. Lloyd, of the McClintic-Marshall Co., on the development and progress of the Navy for the past 100 years. After the reading of the paper a general discussion will take place.

A chess tournament will be started in the near future. All desiring to enter should leave their names at the office.

On last Thursday night, eleven local bowlers organized an individual candle pin tournament. Entries were paid in and games rolled the same evening with the following results: Gold medal—Bullard, 94, 88, 101, total 283; Silver medal—Barrett 92, 89, 95, total 276; Bronze medal—Jacques 82, 89, 97, total 268; the following men finished in the order named: Collins, 98, 80, 86, total 264; Cotton, 78, 94, 79, total 251; Beck, 71, 102, 76, total 249; Weston, 78, 97, 73, total 248; Orr, 79, 77, 74, total 230; Russell, 78, 82, 61, total 221; Amo, 71, 78, 67, total 216; Greene, 78, 74, 64, total 216; Beck won a silver medal for the highest single string score.

The following high scores were made on the local alleys during the week ending January 13:

Candle pins—Barrett, 101, 103, 106; Orr, 103; Beck, 102; Bullard, 101, 102; Barte, 102; Louch, 100; Claherty, 110.

Duck pins—Barte, 104, 107, 103, 110, 102, 113, 108, 104, 103, 101, 103, 101; Barrett, 108, 104; Smith, 105; Carpenter, 103; Bullard, 107, 107; Hess, 109.

Ten pins—Beattie, 203.

Band Concert.

A concert will be given by the Isthmian Canal Commission Band at Gatun, C. Z., Sunday, January 21, 1912, at 5.00 p. m. The program follows:

1. March—*Grand Opera* .... Missud
2. Selection—*The Golden Girl* (by request) .. Howard
3. Waltz—*Farewell to Munich* .... Gung'l
4. Overture—*Poet and Peasant* .... Suppe
5. (*a*) Two Step—*Alexander's Ragtime Band* .... Berlin
   (*b*) —*That Mysterious Rag* .... Snyder
6. *Excerpts from Faust* .... Gounod
7. *Intermezzo Elegante from Tales of Hoffman* .... Offenbach
8. *The Only Tune the Band Could Play was Auld Lang Syne* .... Hayes

   A Legend: Once there was a band which had but one tune in its repertoire. Wherever this band played it made this tune serve all purposes. The above number is an illustration of the different ways in which this band rendered this old song.
9. Medley Selection—*Summer Days* .... Recker
10. March—*Whistling John* .... Ascher

CHARLES E. JENNINGS, *Musical Director.*

The next concert will be given at Empire, C. Z., January 28, at 6 p. m.

Married.

WOLF-EGGLESTON—At the Y. M. C. A., Cristobal, on January 10, 1912, Helen Amelia Eggelston, of Panama, New York, to Charles Augustus Wolf of Gatun, the Rev. Carl H. Elliott officiating.

BYRNE-COCHEZ—On January 12, at St. Ferdinand's Church, Empire, by the Rev. Father Allot, Lydia Bertha, daughter of Mr. and Mrs. Theophilus Cochez, to Michael J. Byrnes. Canal Zone residence, Empire.

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning January 12, 1912.

FRESH MEATS.

	Price.
Mutton—Stewing, per pound	6
Shoulder, neck trimmed off, (4 pounds and over), per pound	9
Entire forequarter (not trimmed), 10 pounds and over, per pound	8
Leg (8 to 10 pounds), per pound	17
Cutlets, per pound	18
Short cut chops, per pound	20
Lamb—Stewing, per pound	6
Entire forequarter, neck trimmed off, per pound	9
Leg (5 to 8 pounds), per pound	20
Chops, per pound	24
Cutlets, per pound	24
Veal—Stewing, per pound	10
Shoulder, for roasting (not under 4 pounds), per pound	12½
Chops, shoulder, per pound	16
Chops, per pound	24
Loin, for roasting, per pound	24
Cutlets, per pound	28
Pork—Loin chops or roast, per pound	16
Beef—Suet, per pound	2
Soup, per pound	5
Stew, per pound	8
Corned, No. 1, per pound	12
Corned, No. 2, per pound	10
Chuck roast (3 pounds and over), per pound	12
Pot roast, per pound	12½
Rib roast, second cut (not under 3½ pounds), per pound	16
Rib roast, first cut (not under 3 pounds), per pound	18
Sirloin roast, per pound	19
Rump roast, per pound	19
Porterhouse roast, per pound	20
Steak, chuck, per pound	12½
Round, per pound	13
Rib, per pound	18
Sirloin, per pound	19
Rump, per pound	19
Porterhouse (not less than 1½ pounds), per pound	20
Tenderloin (Western), per pound	24

MISCELLANEOUS.

Caviare, Russian, per tin	47, 89
Livers—Beef, per pound	7
Calf, each	60
Half, each	30
Steak, Hamburger, pkg	13
Sausage—Bologna, per pound	10
Frankfurter, per pound	12
Lieberwurst, per pound	10
Devonshire Farm, per pound	17
Sweetbread—Veal, per pound	1.20
Beef, per pound	25
Eggs, fresh, dozen	42
one-half dozen only	22
Bluefish, fresh, per pound	14
Halibut, fresh, per pound	15
Oysters, 1 qt. kegs, per keg	50

POULTRY AND GAME.

Chickens—Fancy roasting, milk fed, large, each	1.35
Fancy roasting, milk fed, med., each	1.00
Fancy roasting, corn fed, about 4½ pounds, each	90
Fowls, each 60, 70, 80, 90,	1.00
Ducks, Western, about 4½ pounds, each	1.00
Hens, milk fed, for roasting, about 3 pounds, each	*50
Broilers, milk fed, each	70
corn fed, each	60
Turkeys, per pound	25
Squabs, each	35
Capons, each	2.10
Grouse, each	50

CURED AND PICKLED MEATS.

Ham—German, Westphalia, per pound	36
Sugar cured, per pound	20
Sliced, per pound	22
Half, for boiling, per pound	21
Boiled, per pound	28
Hocks, per pound	‡8
Todd's Smithfield Virginia, per pound	30
Bacon—Breakfast, whole piece, per pound	23
Breakfast, sliced, per pound	24
Pork, salt family, per pound	13
Ox tongues, each	1.00
Pigs' feet, per pound	9
Tongues, per pound	18
Sliced bacon in 1-pound tins, per tin	30
In 1-pound jars, per jar	30

DAIRY PRODUCTS.

	Price.
Butter—Creamery special, per pound	45
Cheese—Roquefort, per pound	45
Philadelphia cream, cake	10
Young America, per pound	20
Swiss, per pound	26
Edam, each	1.00
Parmesan, lb	§35
Neufchatel, cake	6
Gouda, per pound	34
Milk (Certified), per bottle	**20
Buttermilk, bottle	**15
Fer-mil-lac, bottle	**20
Ice cream, quart	‡25
½-gallon	‡50

VEGETABLES AND FRUITS.

Beets, per pound	3
Celery, per head	10
Cabbage, per pound	4
Cucumbers, per pound	12
Carrots, per pound	4
Lettuce, per pound	*14
Onions, per pound	3½
Potatoes, white, per pound	3½
sweet, per pound	2
Parsnips, per pound	4
Squash, per pound	3
Turnips, per pound	3
Yams, per pound	3
Apples, per pound	5
Cranberries, per pound	*5
Grapes, per pound	†12
Grapefruit, each	4
Lemons, dozen	24
Limes, per 100	80
Oranges, per dozen	12
Pears, per pound	*5

---

*Indicates reduction from last list.

**Indicates 5 cents allowed for return of bottle.

†Indicates advance on last list.

Height of low water to the nearest foot	125.0	92.0	44.0		

*Spillway closed from January 9, at 3 p. m., until January 13, at noon.

Contracts for Clearing Trails.

The bids will be received by the Purchasing Agent on the Isthmus, Isthmian Canal Commission, Mount Hope, Canal Zone, until 2:30 p. m., Friday, January 19, 1912, at which time they will be opened in public, for the clearing of the following trails: Cruces-Gamboa and Mount Hope-Majagual. Work shall be done in accordance with specifications to be obtained upon application to the Superintendent of Public Works, Isthmian Canal Commission, Administration Building, Panama. Proposals may be made for clearing each trail separately, or for both. Successful bidders will be required to furnish a bond or make a cash deposit in the sum of ten per cent of the amount bid as a guarantee that the work will be carried out. Proposals should be enclosed in a sealed envelop, marked "Proposal for Clearing Canal Zone Trails," and addressed to the undersigned. The Commission reserves the right to reject any and all bids, or accept any bid, as may be deemed to its interest, and to waive defects and informalities in proposals.

C. NIXON.
Purchasing Agent on the Isthmus.

The following ships arrived at, or departed from, the port of Balboa during the week ending January 13:

Arrivals—January 7, *Quito*, from Guayaquil; January 8, *Mantaro*, from Callao; January 8, *Guatemala*, from Callao; January 10, *City of Panama*, from San Francisco; January 10, *Tampico*, from San Francisco. Departures—January 8, *Pachitea*, to Callao; January 9, *Chile*, to Guayaquil; January 10, *City of Para*, to San Francisco; January 11, *Limari*, to Valparaiso; January 13, *Pleiades*, to San Francisco; January 13, *Mantaro*, to Callao.

MOVEMENT OF OCEAN VESSELS.

The following is a list of the sailings of the Panama Railroad Steamship Company; of the Royal Mail Steam Packet Company; of the Hamburg-American Line, and of the United Fruit Company's Line.

Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Chairman's Report.

The report of the Chairman of the Isthmian Canal Commission for the month of December is published in full in other columns of this issue of The Canal Record. It gives a detailed account of the progress of the Canal Work in all departments and divisions.

Laying Spillway Dam at Gatun.

In the work of filling the interstices between the present piers and constructing the ogee of the Spillway Dam at Gatun, which was outlined in The Canal Record of December 20, 1911, delay was being caused by difficulties encountered in making watertight the sheet-piling cofferdam across the 40-foot space at the toe of the ogee. To accomplish the same end more expeditiously, the apertures which had not already been closed with heavy timber gates were stopped temporarily, cutting off the spillway flow entirely and allowing the whole pit to be pumped out. A concrete section of the ogee, about 10 feet long, was built across the 40-foot space near the cofferdam as originally intended and the backwater cofferdam, 4 feet high, was extended to same, thus enclosing two-thirds of the foundation and permitting flow across the remaining section. The spillway was closed nearly four days during which the surface of Gatun Lake rose .2 foot per day. Its maximum height from this cause, 15.5 feet, was attained at noon on Saturday, January 13. The four apertures at the west side were opened that afternoon.

Since that time the portion of the pit to the east of the bulkhead, comprising the base for about two-thirds of the dam yet to be constructed, has been cleared of silt and debris by means of a grab bucket operated from a stiff-legged derrick resting on one of the piers. The soil was dumped along the outer side of the bulkhead. Concrete has been placed in 5 interstices to the full height of the piers, and all of those remaining, except the four open at the west side, will be closed to full height in the present operations. Across a section about 15 feet in length, the pit has been filled with cyclopean concrete and the ogee hasbeen constructed to half of its height. Forms are being erected for the remaining sections, which will be completed one at a time.

Concrete is furnished in 4-cubic yard, narrow-gage dump cars from the Spillway plant and dumped directly from a trestle extending over the piers from the end of the operating tunnel on the east side. From the trestle the concrete is dumped directly into the spaces between the piers or into a wide-mouthed chute which carries it to the pit and ogee. So far, 5,000 cubic yards will have been placed in this work, which was begun during the last week in December. The portion of the ogee now under construction will be brought to full height (50 feet above sealevel) and the four apertures at the west side will then be closed in order that the rest of the dam may be finished. It is estimated that the apertures are capable of discharging without serious rise, a freshet as large as any recorded in the dry season during the American operation.

Change in Weather Stations.

On account of the impending rise of Gatun Lake, the rainfall and river stations have been removed from Tabernilla San Pablo, and Bohio. The apparatus from San Pablo, consisting of automatic rain gauge and register, has been transferred to New Frijoles, bordering the projected surface of Gatun Lake on the relocated line of the Panama railroad. It is planned to establish other rainfall stations along the line of the relocated Panama railroad later on when permanent settlements have been established.

The fluviograph at Bohio, which was erected by the French and at which records of heights of the Chagres have been taken since 1890, will continue in use for the present. The Bohio rainfall station was established by the French in 1894 and those at San Pablo and Tabernilla were established by the Americans in 1907.

West Dam at Miraflores.

Following the completion of the hydraulic fill for the core of the west dam at Miraflores, the placing of dry spoil was augmented by 23,750 cubic yards of earth and rock during the month of December. When the hydraulic fill was finished its surface lay approximately level at 59 feet above sealevel; under the stress of heavy material, dumped along the edges and sinking in the silt, the core is being forced upward on each side in a wave-like formation, about six feet wide and with the crest about four feet above the level of the center, as yet undisturbed. The materials are thus being mixed, so that the impervious core of silt will be reinforced by the bowlders lodged within it, after the nature of cyclopean concrete. To made the hydraulic fill, 661,048 cubic yards of material were supplied from the monitors excavating in and below the site for Miraflores Locks. A total of 1,070,377 cubic yards of dry fill had been made up to January 1, 1912, leaving 415,678 cubic yards to be placed. As part of the dam construction, the plans call for the excavation of 10,000 cubic yards, to make room for the concrete core walls by which the dam will be connected with the locks.

Sample Fender Chain.

A chain to be used with the fender machine, as one of the safety devices at the locks, has been ordered from the Navy Department, and will probably be manufactured at the Boston Navy Yard. It will be 428 feet long, of the best three inch iron, and a triplet of it must be tested to stand a minimum breaking strain of 262 tons.

Gate Construction at Gatun.

The erection of the guard and upper main gates for both chambers of the upper lock at Gatun having been completed, the contractors are engaged in moving the construction bridges to the site of the intermediate gates of the locks. In the west chamber the bridge has been moved and re-erected and by the end of the week the east chamber bridge will be similarly placed. At the upper gates some riveting remains to be done, but for this a small force can work from adjustable scaffolds, keeping pace with the erection of skeletons and placing of sheathing, which are regarded as the features of paramount importance.

Lower Wing Walls at Pedro Miguel Lock.

The southeast wing wall at Pedro Miguel Lock, flaring outward at an angle of thirty degrees from the axis of the east side wall at its southern extremity and extending to the hill east of the lock site, is about one-half completed. It will require in all about 3,000 cubic yards of concrete and it is estimated that the portion necessary to complete it can be laid within a month. A part of the material was supplied by a stationary 2-cubic yard mixer, placed near the lower end of the east side wall and used in connection with narrow-gage railroad running to chamber cranes and derricks, but since the removal of this plant, to be repaired and transferred to Miraflores Locks, concrete for the wall has been furnished by two ½-cubic yard portable mixers. Upon the completion of the southeast wing wall the work will be continued on the corresponding wall on the west side. Operations were temporarily discontinued there 3 months ago, after the foundation and about 45 per cent of the wall had been laid. Each of these wing walls is to be 240 feet long, by 55 feet high, and resting on a base slab, 28 feet 9 inches wide and 4 feet thick, with its lower edge at elevation +12. On the front will be a toe, battering 1 on 3 to a point 11 feet above the base, from which point to the top of the wall the face will be vertical. The slab forming the base of the wall will be narrowed by three-inch steps

NOTES OF PROGRESS.

(Continued.)

every 10 feet, vertically, until the width of the top will be 14 inches. This slab is braced by heavily reinforced counterforts which are 30 inches wide and spaced 15 feet on centers. Rack and return tracks for the towing locomotives will be laid on top, extending to the lower end of the wall.

The lower center guide wall, of which 950 feet are completed, will not be extended to its full length of 1,200 feet until after the completion of the west dam at the upper end of the lock. The site of the wall is crossed by the tracks over which spoil is hauled for building the dam and for completing the west backfill.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 76 per cent completed, 171,305 cubic yards, out of a total of 225,000, having been placed at the close of work on January 20. A statement of the amount laid each working day last week, and of the total in place, follows:

Date.	Concrete Laid.	Rock.	Hours worked	No. Mixers.
January 15....	360	22	15.30	2
January 16....	264	18	13.30	2
January 17....	350	16	11.00	2
January 18....	296	....	12.30	2
January 19....	436	30	16.00	2
January 20....	412	13	15.00	2
Total.......	2,118	99	83.30	2
Aggregate...	2,217			
Previously reported.....	169,088			
Grand total..	171,305			

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending January 20, follows:

Date.	Hours worked.	Cubic Yards.
January 15..........................	2.55	1,526
January 16..........................	4.48	2,279
January 17..........................	2.54	1,448
January 18..........................	3.53	1,951
January 19..........................	3.48	2,046
January 20..........................	4.02	2,009
Total..........................	22.20	11,259

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending January 20, follows:

Date.	Hours worked.	Cubic Yards.
January 15....................	8.05	2,927
January 16....................	7.45	3,240
January 17....................	5.00	2,294
January 18....................	4.55	1,832
January 19....................	7.15	2,615
January 20....................	7.45	2,892
Total....................	40.15	15,800

Society of the Chagres Dinner.

The first dinner of the Society of the Chagres (six year men on the canal and railroad work), was held at the Hotel Tivoli in Ancon on January 20. There were present 196 of the 275 members, of whom 90 per cent are living on the Isthmus. Mr. Edward J. Williams was the toastmaster and toasts were responded to as follows: "The Objects of the Society," Mr. John K. Baxter; "Sanitary Conditions as We Found Them in 1904," Col. W. C. Gorgas; "An Honest Job," Chief Justice H. A. Gudger; "The Construction of the Canal, A School of Citizenship," Col. Tom. M. Cooke; "After the Canal," Capt. R. E. Wood; "Pioneer Comforts," Mr. John Burke; "The Real Reason We Are Here," Mr. J. J. Meehan.

Personal.

Lieut.-Gen. Sir Robert Baden-Powell arrived at Colon from Southampton on the *Arcadian* on January 21, and left for New York on January 23. He was met at the dock in Colon by a deputation of 25 of the Canal Zone Boy Scouts and, in response to their greetings, he made a brief speech. In the United States he will make a tour of the country in the interest of the Boy Scout movement, making addresses in 21 cities.

CONCRETE WORK IN THE LOCKS.

Over 76 per cent of the concrete for the locks is in place, the amount at the close of work on January 20, being 3,216,740½ cubic yards, out of a total of approximately 4,199,400. A total of 23,315 cubic yards of concrete was laid in the locks during the week ending January 20.

GATUN LOCKS.

Over 89 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on January 20, being 1,790,323½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending January 20, and of the total, follows; and a similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant. 2-cubic yard mixers.			Large stone	Total.

*The 411 yards shown for the portable mixers are reinforced concrete, and were placed on the following days: January 15th, 71; January 16th, 78; January 17th, 71; January 18th, 86; January 19th, 54; January 20th, 51.

PEDRO MIGUEL LOCK.

Concrete work in the lock at Pedro Miguel is over 95 per cent completed, 799,651 cubic yards, out of a total of 837,400, bucket measurement, having been placed at the close of work on January 20. The record for each of the six 8-hour working days of last week, follows:

Date.	Auxiliary Plant.						Large stone.	Total.
	2-cubic yard mixers.			½-cubic yard mixers.				
	Concrete placed.	Hours worked.	No. of mixers	Concrete placed.	Hours worked.	No. of mixers		
	Cu. Yds.			*Cu. Yds.*			*Cu. Yds.*	*Cu. Yds.*

MIRAFLORES LOCKS.

Over 46 per cent of the concrete for the system of two twin locks at Miraflores was in place on January 20, the total amount on that date being 627,046 cubic yards, bucket measurement, out of a total of approximately 1,362,000. The record for each of the six 8-hour working days of last week, follows:

Date.	Construction Plant. 2-cubic yard mixers.			Auxiliary Plant.							Total.
				2-cubic yard mixers.			½-cubic yard mixers.

SOCIAL LIFE OF THE ZONE.

Women's Clubs.

The business meeting of the Canal Zone Federation of Women's Clubs will be called to order in the Commission clubhouse, Cristobal on Saturday morning, January 27, at 9 o'clock. The nominating committee, the credentials committee and all other committees that have business to transact before the meeting are expected to convene immediately upon the arrival of the train from Panama. The afternoon session will be held at 2.30 o'clock. Lunch will be taken by the delegates and club women, as usual, at the Commission hotel at the regular rate. All reports are to be presented in writing.

The Cristobal Woman's Club held a reception for Miss Mabel T. Boardman at the clubhouse on Wednesday afternoon, January 17. There were about sixty club members and guests present. Miss Boardmann responded to a request and spoke on the organization and work of the American National Red Cross. The meetings of the Cristobal club in February will be as follows: On February 7, general meeting, when Mr. Harry Sawtelle will speak under the education department; February 14, the home department, program on House Furnishings and Decorations; February 21, under the art and literature department, An Afternoon with Grieg; February 28, meeting of the Executive Board in the clubhouse at 9 a. m.

The Empire Woman's Club met in the clubhouse on Thursday, January 18, when there was a program consisting of papers on China. The club is increasing in membership and the attendance was good.

At the meeting of the Paraiso Woman's Club on Wednesday, January 17, Miss Alexander delivered an address on Primary Education. Mrs. Harry Bain presided in the absence of the president.

A concert for the benefit of the Colon Humane Society was held in the Municipal Building, Colon, on Monday evening, January 15. Mr. Geo. Arnold, professor of music of the Brussels Conservatory, played violin selections, and Signor Arturo Pazzagi sang. Miss Dorothy Layland was the accompanist. The receipts were $170.

On Friday evening, January 12, a subscription concert was given at Colon Hospital by the hospital staff for themselves and their friends. Mr. Arnold and Miss Layland played.

I. O. O. F., Installation of Officers.

At the regular meering of the Isthmian Canal Lodge No. 1, I. O. O. F., held in the Commission lodge rooms at Gorgona on January 16, District Deputy Grand Sire B. F. Sisson of Gatun installed the following officers for the ensuing term: Past Grand, H. L. Greeley; Noble Grand, A. A. Hunter; Vice Grand, L. A. Taber; Secretary, R. A. Schofield; Treasurer, C. E. Whipple; Warden, C. J. Jansen; Conductor, C. G. Calvit; R. S.-N. G., C. E. Davis; L. S. N. G., David Gaerste; R. S. V. G., R. R. Robinson; L. S. V. G., Robt. Varenkamp; R. S. S., R. K. Knox; L. S. S., F. F. Farrell; Inner Guard, S. E. Calvit; Outer Guard, Martin Wago; Chaplain, Alfred Edwall.

Fund for Aid of Discharged Prisoners.

The amount of money subscribed to the Christmas fund for the Canal Zone penitentiary amounted to $57. A part of this sum was used for supplies for the Christmas dinner, and the remainder has been placed in the hands of the penitentiary chaplain to be used for the relief of convicts discharged from the institution. This is a standing fund and contributions to it will be welcome at any time during the year. All communications regarding this fund and its purposes may be addressed to Mrs. C. A. Devol, Culebra, or to the Chaplain, Canal Zone Penitentiary, Culebra.

United Spanish War Veterans.

A regular meeting of Camp Chagres No. 2, U. S. W. V., will be held in the I. C. C. Lodge Hall, Empire, on January 28, at the usual hour. Several recruits are to be mustered into the Camp, and it is requested that all comrades attend; uniforms and badges to be worn.

Missing Men.

Any one having any knowledge of the relatives, home address, or previous history of Jack Claes, said to be an Englishman, scow-foreman, who was accidentlly drowned at Cristobal on December 27, 1911, is requested to communicate with the British Vice-Consul, Colon.

Any one having information regarding the whereabouts of Rudolph Pettalkow, who left his home in Cedar Rapids, Iowa, three years ago, and is believed to be on the Isthmus, is requested to communicate with the American Legation.

Suicide.

Rudolph Gunner, who up to a month ago was employed in the Central Division, committed suicide Sunday evening, January 21, in House 48, Empire, by shooting himself through the right temple with a revolver. He was a native of Texas, was 36 years of age and had been on the Isthmus several times since 1904. His mother is living at Dallas, Texas.

Baseball at Porto Bello.

The Porto Bello ball grounds have been improved and the team desires games either on the home grounds or abroad. Communicate with Chas. Oettli, Porto Bello.

Stamp Sales and Money Orders.

Stamp sales at the Canal Zone Post-offices during the month of December, 1911, were the largest of any month in the record of the Zone postal service, amounting to $10,449.80. The sales during the period of six months ending on December 31, 1911, amounted to $43,222.98; for the corresponding period in 1910 they were $42,280.27.

Money orders issued during the six months ending December 31, 1911, numbered 117,395, for an aggregate value of $2,610,446.44. The fees amounted to $11,957.22. During the corresponding period in the preceding year, 107,748 orders, for $2,670,907.24, were issued and the fees collected amounted to $11,800.64.

The sailing date of the steamship *Cristobal* has been set for Sunday, January 28, at 2 p. m., from Dock No. 11, Cristobal.

Pilots, Mates, Masters, Engineers, Chauffeurs.

Examinations for pilots, mates, masters and engineers; and for chauffeurs, will be held by the Board of Local Inspectors at the Administration Building, on January 31, 1912. All applicants for licenses as chauffeurs must secure from the Department of Civil Administration, Executive Office, Ancon, forms of application, and information respecting the filling out of the same, not later than the day previous to the examination. All applicants for examination must be present at the Administration Building at 8.00 a. m. on January 31, with papers in proper form. In addition, applicants for chauffeurs' licenses must demonstrate their capacity properly to operate an automobile, and must have the automobile with them.

Rodmen and Levelmen.

An examination to test the fitness of rodmen and levelmen for promotion will be held at Culebra on Sunday, February 4. Employes wishing to enter this examination should forward their applications through the head of the department or division in which they are serving to Mr. A. B. Nichols, chairman of the examining board, Culebra. Candidates should bring with them tables of the circular functions and triangles.

Misdirected Letters.

ANCON, C. Z., January 20, 1911.

The following insufficiently addressed letters originating in the United States and its possessions have been received at the office of the Director of Posts and may be secured upon reouest of the addressees:

Bartonl, Edward J.
Barker, Aubrey
Belzil, Mrs. Georgietta
Benny, Mrs. William
Bentley, Hugh S.
Berner, H. F.
Bishop, Christopher
Bolz, Fred
Bynon, Mrs. J.

CANAL WORK IN DECEMBER.

Monthly Report of the Chairman and Chief Engineer to the Secretary of War.

CULEBRA, C. Z., January 17, 1912.

The Honorable the Secretary of War,
Washington, D. C.

SIR: I have the honor to submit the following report of operations on the Isthmus for the month of December, 1911.

Department of Construction and Engineering.

The following table summarizes the principal items of construction work accomplished by the Atlantic, Central, and Pacific Divisions during the month:

ITEM.	Unit.	Atlantic.	Central.	Pacific.	Total.
Work excavation, dry	Cubic yards	50,199	1,359,554	132,840	1,542,593
Work excavation, wet	Cubic yards	533,409	2,337	278,960	814,706
Total work excavation	Cubic yards	583,608	1,361,891	411,800	2,357,299
Plant excavation, dry	....	....	....	....	....
Plant excavation, wet	Cubic yards	81,977	....		81,977
Total Canal Excavation	Cubic yards	665,585	1,361,891	411,800	2,439,276
Material placed in dams	Cubic yards	322,815	....	31,080	353,895
Concrete placed in locks and dams	Cubic yards	47,133	....	63,132	110,265
Explosives used	Tons (Gross)	68.20	237.61	30.16	335.97
Rock drilled	Feet	55,865	447,079	88,073	591,017
Tracks removed	Miles	....	12.15	....	12.15
New tracks laid	Miles	2.40	25.65	3.80	31.85
Rock crushed	Cubic yards	42,247	....	66,101	108,348
Cement used	Barrels	49,593	11	66,879	116,483
New roads built	Miles	0.28	....	....	0.28
Water mains laid	Feet	838	3,256	3,465	7,559
Sewers laid	Feet	623	535	301	1,459
Open drains and ditches dug	Feet	....	39,750	11,010	50,760
Average daily force	....	7,112	8,296	5,500	20,908
Average rainfall	Inches	2.44	0.78	1.59	1.19

First Division, Office of the Chief Engineer.

MASONRY AND LOCK STRUCTURES.

The material under contract for work designed in this subdivision is being inspected by the force of the General Purchasing Officer in the United States, and the erection work on the Isthmus is being conducted by the Division Engineers, the inspection being cared for by this subdivision. Work was continued on the grinding of fixed irons and preparing the valve chambers for the installation of the valves, which work is being done under supervision of this office. This subdivision is also charged with general inspection of the masonry work of all the locks.

LOCK GATES AND PROTECTIVE DEVICES.

Shop work in the United States—Up to December 20, a total of 43,840 tons of structural steel had been accepted at the rolling mills, or about 85 per cent of the total, of which 4,028 tons were rolled and accepted between November 20 and December 20, and a total of 24,723 tons of riveted structural material was shipped from Rankin shops, or about 50 per cent of the total contract weight. Of this last item, 1,412 tons were shipped between November 20 and December 20. It should be noted that the above total includes parts lost on the steamship *Moldegaard*; the amount is believed to be about 2,700 tons. Mill orders have been placed for the replacement of the material lost on this steamer, and about 300 tons of same have been rolled up to December 20.

The manufacture and shipment of steel and iron castings for the gates continued during the month; more especially a considerable tonnage of manhole rings and covers was shipped. No more shipments of the pumping system of handrailing were made. One leaf 47 feet 4 inches high is being assembled at the Pittsburgh shops of the contractor to check the fitting of same. The following are details of shipments:

Gatun Locks—Upper guard gates, 4 leaves, 54 feet 8 inches high, Nos. 37 to 40 inclusive; all material has been completed and shipped. Upper and middle gates, upper lock, 8 leaves, 77 feet high, Nos. 29 to 36, inclusive; all completed and shipped. Safety and lower gates, upper lock, Nos. 21 to 28 inclusive; all completed and nearly all shipped. Middle and lower gates, middle lock, 8 leaves, 77 feet 10 inches high, Nos. 13 to 20, inclusive; no shipments of material for these gates have been made during the month.

Pedro Miguel Lock—Upper guard gates, 4 leaves, 54 feet 8 inches high, Nos. 50 to 53, inclusive, have been completed and shipped. Upper and middle gates, 8 leaves, 79 feet high, Nos. 54 to 61, inclusive; these gates have been completed in the shop and practically all shipped. Safety and lower gates, 8 leaves 79 feet high, Nos. 62 to 69, inclusive, have been completed in shop and practically all shipped. Lower guard gates, 4 leaves, 47 feet 4 inches high, Nos. 70 to 73, inclusive; have been about 75 per cent completed and perhaps 25 per cent shipped.

Miraflores Locks—Practically none of this material has been manufactured or shipped.

The output at the shops has lately been less than according to the schedule. It has, therefore, been decided to resume night work on certain parts.

LOCK GATE ERECTION.

Gatun—Upper guard gates, 54 feet 8 inches high, leaves 37 to 40, inclusive; work on these gates during the month consisted of reaming and riveting in the sheathing and grinding the end of leaf 37 for the reception of the end reaction castings. No end reaction castings have as yet been attached. The end plates have been caulked onto the leaves.

Upper gates, 77 feet high, leaves 33 to 36, inclusive: Erected during the month 24 panels of skeleton; riveted 34 panels of skeleton; sheathing erected, 39 panels.

Pedro Miguel—Upper guard gates, 4 leaves, 54 feet 8 inches high, leaves 50 to 53, inclusive: The total work during the month consisted of erecting 15 and riveting 18 panels of sheathing. There remain to be riveted in these 4 leaves about 28 panels of sheathing.

Safety gates, 4 leaves, 79 feet high, leaves 62 and 63: Bottom girders were placed. Leaves 64 and 65: Skeleton erected 2 panels high.

The total tonnage erected to January first, without regard to its being riveted or fully fitted, is about 4,700 tons, out of a total of 58,000 tons.

LOCK GATE RECESS COVERS.

The material for 14 recess covers, except cast iron cover plates for same, arrived at Cristobal on December 11. The unloading of this material proceeded very slowly so that it was not possible to deliver the material at Gatun until December 28. The contractors began erection on cover No. 21 on December 29. It is understood that 10 recess covers were lost on the steamship *Moldegaard* which was wrecked. These are to be replaced at once by the contractor. Sixteen additional covers have since then been received on the Isthmus.

INSPECTION OF OPERATING MACHINERY AND ELECTRICAL EQUIPMENT.

The force of this subdivision, reporting directly to this office has cared for the technical matters relating to inspection as follows:

(1) *For the Stoney gate valves, purchased under Circular 614*—The second Stoney gate valve machine was tested and ordered shipped to the Isthmus. The first machine delivered was partially erected in place on the Isthmus. During the month tests continued on the test motors, purchased under this contract, for the quality of insulation and ability of the motors to withstand the severe climatic conditions.

(2) *For the rack railway and other material purchased under Circulars 619, 636-D, and 635*—For the different classes under these circulars, which are now under contract, the state of completion of delivery varies from about one per cent for carbon steel rack castings, to eighty-three per cent for some of the major items, and one hundred per cent for some of the minor items. On all portions of these contracts, satisfactory progress was made during the month. Satisfactory progress was also made during the month on Class 2, Circular 619, carbon steel rack castings, on which, as stated in report for the preceding month, the deliveries were very much behind time.

(3) *For the gate operating machines, Class 1, and miter gate machines, Class 2, purchased under Circular 627*—The first miter gate moving machine was tested at the works of the manufacturer, found to be satisfactory, shipped to the Isthmus, and, with the exception of the strut, the complete machine was received on the Isthmus. The second miter gate moving machine was practically completed and ready for test at the works of the manufacturer. The miter forcing machine was practically completed and will be tested at once.

(4) *For the gate and girder hoisting machinery for the emergency dams, purchased under Circular 616*—The tests conducted upon the types of worms for girder hoists gave information which was not available when the design was prepared and upon the information obtained, award for the worms was made. Casting and machine work progressed satisfactorily.

(5) *For the Gatun hydro-electric station*—The General Purchasing Officer was instructed to make award to the lowest bidders, as follows: Class 1, Items 1, 2, 3, 4, and 6, for turbines, governors, headgates, penstocks and lubricating system, respectively, to the Pelton Water Wheel Company. Class 2, Items 1, 2, and 3, generators and motor-driven exciters, to the General Electric Company. Class 3, Item 1, traveling crane, to the Niles-Bement-Pond Company. The foregoing equipment covers three 2,250 k. w. water turbines, three 2,500 k. v. a. electric generators, and three 20-ton cranes and auxiliaries,

as above mentioned, the total contract price being $145,600.50.

(6) *Electric towing locomotives*—Bids were received and canvassed, and award made upon alternative "A," for carbon steel. The General Purchasing Officer was authorized to make award for Item 1, Class 1, for one electric towing locomotive for trial to the General Electric Company. Class 1, Item 2—39 electric towing locomotives; award not yet made. Class 1, Item 3—Spare parts; award not yet made.

(7) *For the locomotive cranes, derricks and hoisting engines for erection plant of machinery and electrical equipment*—General Purchasing Officer was authorized to make award for Class 1, Items 1 and 2, for four 15-ton locomotive cranes, and auxiliary hooks and lines, to the Industrial Works, Bay City, Michigan Class 2, Items 1 and 2—Award not yet made.

The force installing machinery and electrical equipment on the Isthmus during the month set established bench marks for various Stoney gate valve machinery chambers, miter gate moving machines and cylindrical valves; set foundation bolts for six miter gate moving machines, installed bulkheads for test of two cylindrical valves, and distributed material for 360 feet of locomotive track on the east lock wall. During the month 101 cubic yards of concrete were placed.

EMERGENCY DAMS.

The preparation of working drawings, rolling and casting material and inspection of same in the United States, progressed satisfactorily during the month. Up to December 20, a total of 301 drawings of the turning and wedging machinery, and a total of 127 drawings of structural parts, were completed and approved. At the rolling mills and foundries about 1,500 tons of nickel steel and 837 tons of structural steel were rolled; and 561 tons of carbon steel castings and 250 tons of Vanadium steel castings were cast; besides this, 146 tons of carbon steel forgings, as well as the roller bearings for 3 dams and some other smaller parts were turned out.

AIDS TO NAVIGATION.

During the month, 109.5 acres of ground were cleared in the Gatun Lake section and Pacific Division for sites for range towers and reference targets, at an average cost of $18.58 per acre; 33,623 linear feet of trochas were cut, and 3,677 linear feet of profile taken. Four buoys were referenced, and five buoys were located and referenced in the Gatun Lake section.

Range 9-11—The concrete vestibules and newel posts for both front and rear towers were completed, and the temporary acetylene lights installed and exhibited.

Range 1-2—A temporary frame tower 24 feet high was set upon the foundation on the site of the front tower. The rear tower was completed, except the stairs, doors and windows. Both towers were fitted with locomotive headlights, which will be kept lighted for use in connection with dredging operations, as will also the lights in Range 9-11.

Range 13-14—The 29 bearing piles were armored with concrete to a depth of 6 feet below surface and the reinforced foundation pier, 24 feet in diameter and 6 feet high, was completed, and the tower wall carried up to a height of 7 feet. The rear tower walls were constructed to their full height, 48 feet.

Range 5-6. Gatun—Work on the foundation of both front and rear towers was begun.

The casting of stair treads, radial beams, stair strings, moldings and window lintels for the various towers was being carried on at the Central plant at Balboa.

Plans for two types of structures for the west breakwater light in Limon Bay were made during the month, and estimates of the cost are being prepared.

Atlantic Division.

GATUN LOCKS.

Excavation—During the month one shovel was engaged on borrow pit excavation for the locks backfill, 37,331 cubic yards of material being removed.

Backfill—Backfilling behind the walls of all locks, and in the center wall of the upper and middle locks, was continued. The backfilling in the south approach wall, and in the center wall of the upper lock south of the intermediate gates, was completed. The quantity placed during the month aggregated 115,101 cubic yards, increasing the total to 1,124,043 cubic yards. On December 31 the backfilling was 69.99 per cent completed.

Receiving and Issuing Material—The receipts of rock exceeded the consumption by 4,087 cubic yards, and cement by 341 barrels. During the month 19,952 cubic yards of sand were consumed. Shipments of sand from the Pacific Division commenced December 29, 628 cubic yards having been received at the close of the month.

Mixing and Placing Plants—Both plants, and all portable mixers, were kept in satisfactory operation during the month.

Power Plant and Pumps—The operation of the power plant and pumps was satisfactory.

Iron and Steel Work—During the month 360.1 tons of fixed steel and 142,570 feet of reinforcing rods were placed; 15.7 tons of reinforcing rails, and 64.4 tons of electric return track were laid.

Concrete Work—There was a decrease of 317 cubic yards in the amount of concrete laid as compared with the figures for the preceding month. The daily average for the 25 working days was 1,744 cubic yards, as compared with a daily average during November of 1,829 cubic yards. The total amount of concrete placed during the month was 43,590 cubic yards, including 308 cubic yards of large stone. The place measurement exceeded the bucket measurement by 489.5 cubic yards. Of the total concrete, 4,280 cubic yards were placed in the upper lock, 474 cubic yards in the middle lock, and 38,836 cubic yards in the lower lock. The concrete work for the entire lock system was 88.06 per cent completed at the end of December.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)..	11.30	8.50
Average number of hours per day worked, per strand of cableway laying concrete and large stone (actual working time)	5.01	....
Average number of mixers per day	4.26	2.00
Average hourly output per mixer (actual working time), cu. yds.	59.09	79.44
Average amount of concrete and large stone laid per hour, per strand of cableway (actual working time) cu. yds.	29.22	....
Large stone laid, cu. yds	308	....
Concrete laid, cableways, cu. yds.	29,544	....
Concrete laid, through chute into dump cars, and by crane cu. yds.	1,630	....
Concrete laid, derricks, cu. yds..	....	2,964
Concrete laid, dump cars, cu. yds	....	7,236
Concrete laid, portable mixers...	....	1,418.5
Total amount of concrete and large stone laid, cu. yds.	31,482	11,618.5

GATUN DAM.

Construction during the month increased the total fill, as determined by cross sections of the material in place, by 322,815 cubic yards, making the total amount in place, 16,997,327 cubic yards.

Hydraulic Fill—The dredges increased the hydraulic fill by 89,752 cubic yards. The total hydraulic fill in place December 31, was 8,828,841 cubic yards.

Dry Fill—The material received from the Central Division, Mindi, and steamshovels Nos. 116 and 134, amounting to 233,063 cubic yards, was placed on the north and south toes of the dam, east and west of the spillway, making the total dry fill in place, 8,168,486 cubic yards.

GATUN SPILLWAY.

Excavation—During the month 80 cubic yards of rock were excavated by hand in preparing foundations, making the total December 31, 1,586,376 cubic yards.

Backfill—During the month 629 cubic yards of material were used in backfilling behind the west wall of the spillway.

Concrete—The work of placing concrete was continued. The amount placed during the month aggregated 3,543 cubic yards, which increased the total to 168,449 cubic yards. The concrete work for the spillway was 74.4 per cent completed.

HARBOR AND CHANNEL SECTION.

Excavation Below Sealevel at Mindi—During the month two steamshovels removed 50,199 cubic yards of rock from the canal prism.

Dredging from Ocean to Mindi—Seven dredges removed 484,024 cubic yards of earth and 49,385 cubic yards of rock from the canal prism. In addition, the dredge *Mindi* removed 1,409 cubic yards of earth from the French canal for the proposed dynamite dock; the *Sandpiper* 72,798 cubic yards of earth from the East Diversion at Gatun; Derrick Barge No. 1 (clam shell) 4,008 cubic yards of earth from the East Diversion at Mount Hope, and the *Chagres* 3,762 cubic yards of earth from the Dry Dock slip. On December 31, 40 feet of water could be carried from Zero to Zero plus 1,900 feet; 35 feet to mile mile 3 plus 2,700 feet; 30 feet to mile 3 plus 3,600 feet; 20 feet to mile 5 plus 2,438.9 feet, the point of intersection with the French Canal.

PORTO BELLO.

PERFORMANCE OF ROCK CRUSHER PLANT.

Length of working day, hours............	8.00
Average number of hours worked per day..	3.61
Average number of cubic yards per hour of working day..........................	211.235
Average number of cubic yards per working hour................................	468.28
Maximum day's output (4 hours 53 minutes) cu. yds.........................	2,220.00
Average day's output (25 days) cu. yds....	1,689.88
Average hourly output (190 hours 50 minutes) cu. yds.........................	221.38
Total output for the month, cu. yds......	42,247.00

SAND, STONE, AND CEMENT SERVICE.

In connection with this service plant steamed 4,400 miles, handled 502 barges .and carried 1,860 passengers.

WEST BREAKWATER, COLON.

46,591 cubic yards of material were excavated, all of which was dumped from the trestle. The double track trestle was extended 728 linear feet. On December 31 the trestle extended 8,746 linear feet from shore. During the month 6,179 cubic yards of Porto Bello rock were placed on the breakwater, making a total of 17,108 cubic yards used for that purpose to January 1. The total amount of rock dredged and dumped on the west breakwater to December 1, 1911, was 805,332 cubic yards. During the month 49,385 cubic yards of rock were dredged and dumped, increasing the total to 854,717 cubic yards. The amount of dry fill placed to January 1 was 570,495 cubic yards.

MUNICIPAL ENGINEERING.

The reservoirs, water mains, sewers, roads, and oil pipe lines were maintained and extended as required to facilitate construction work.

Central Division.

During the month of December the total amount of material excavated in the Central Division was 1,361,891 cubic yards, of which 164,252 cubic yards were classified as earth 1,197,639 cubic yards as rock. Of this quantity, 1,351,082 cubic yards were removed by steamshovels, and contractors removed 2,337 cubic yards by sluicing and 8,472 cubic yards by hand. The total, 1,361,891 cubic yards consisted of primary excavation for the canal prism.

The daily average number of steamshovels at work during the month was 41.54, and the total number of shovel days was 1,038½, as compared with 41.54 at work during the month of November, with 997 shovel days.

For comparison with the work done by the steamshovels during the corresponding month of the previous year, the following table has been prepared:

Period.	Excavated by shovels.	Classification of material.		Av. No. of shovels at work.	W'kg days.	Av. yards per shovel day.
		Rock.	Earth.			
1910:	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*			*C. Y.*
Dec.....	1,386,753	1,008,998	377,755	45.58	26	1,170.30
1911:						
Dec. ..	1,351,082	1,189,867	161,215	41.54	25	1,300.89

Rainfall at Empire: 1910, 9.06 ins.; 1911, 0.20 ins.

The above table shows the average output per shovel to be 11.16 per cent greater in December, 1911, than in the corresponding month of the previous year.

The total amount of the material excavated from the prism in the Culebra Section of the Central Division in December, 1911, 1,351,082 cubic yards, was the highest record in that section for the month of December, the previous high record being December, 1910, when 1,211,400 cubic yards were removed.

The total estimated amount of material to be removed in the Central Division, according to the revised estimate of July 1, 1911, was 101,801,296 cubic yards, and up to January 1, 1912, 85,426,915 cubic yards had been removed, leaving 16,374,381 cubic yards to be removed in order to complete all excavation in the Central Division. From these figures it will be seen that 83 92 per cent of all excavation in the Central Division had been completed up to the close of the month of December and 16.08 per cent remained uncompleted.

Considering the two sections which compose the Central Division, the excavation completed and that to be completed at the close of December operations was as follows:

CULEBRA SECTION.	*Cu. Yds.*
Completed	73,502,824
To be completed	15,941,181

CHAGRES SECTION.	*Cu. Yds.*
Completed	11,924,091
To be completed	433,200

From the above figures it will be seen that the Culebra Section, locally known as the "Culebra Cut," was 82.18 per cent completed, with 17.82 per cent to be completed; the Chagres Section was 96.49 per cent completed, with 3.51 per cent to be completed.

During the month 63,915 cubic yards of material were hauled from the canal prism and dumped in the embankment for the roadbed of the relocated Panama railroad. The total amount of spoil from the Central Division for this purpose at the close of the month was 4,059,291 cubic yards. The Central Division also delivered at Gatun, 201,868 cubic yards of rock and earth for use in the construction of the dam, making the total for this purpose at the end of December, 5,056,167 cubic yards During the month 10,611 cubic yards of rock and earth were furnished for the Colon breakwater, and 10,640 cubic yards to the Pacific Division for backfill at Pedro Miguel locks.

The daily average number of laborers at work on the whole Division during the month was 7,509, and the daily average number of gold employes was 787.

Pacific Division.

DISTRICT NO. 1—LOCKS AND DAMS.

Excavation—The total excavation during the month amounted to 132,840 cubic yards, of which 26,177 cubic yards were classified as earth, and 106,663 cubic yards as rock.

Filling and Embankment—During December, 7,350 cubic yards of dry filling were added to the prism of the west dam at Pedro Miguel, increasing the total amount of material in place at the close of the month to 318,921 cubic yards. The backfill at Pedro Miguel was increased by 32,021 cubic yards, the total in place at the end of the month amounting to 469,309 cubic yards.

At Miraflores, 23,730 cubic yards were added to the dry fill in the toes of the west dam, increasing the total amount in place at the end of the month to 1,070,377 cubic yards. The hydraulic fill for the core of the west dam was completed during the latter part of November, and amounted to 661,048 cubic yards. The backfill was increased by 74,093 cubic yards, the total aggregating 351,681 cubic yards at the end of the month.

Pedro Miguel Lock—The general backfilling of the lock walls was continued. The McClintic-Marshall Construction Company dismantled chamber crane No. 1 at Pedro Miguel, moved it to Miraflores and commenced its reerection in the east chamber of the lower locks on December 26. The amount of iron placed in the mansonry aggregated 198,507 pounds.

Concrete Work—The total amount of concrete and large stone laid at Pedro Miguel was 14,360 cubic yards, as compared with 19,622 cubic yards during November. The concrete was placed as follows: 117 cubic yards in the northeast wing wall; 3,855 cubic yards in the north center guide wall; 77 cubic yards in the northwest wing wall; 4,016 cubic yards in the east wall; 4,035 cubic yards in the center wall; 917 cubic yards in the west wall; 542 cubic yards in the floors; 801 cubic yards in the southeast wing wall.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT PEDRO MIGUEL.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)	8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	2.06	4.95
Average number of mixers per day	....	4.52
	Cu. Yds.	*Cu. Yds.*
Average hourly output per mixer (actual working time)	....	23.53
Average amount of concrete and large stone laid per hour, per chamber crane (actual working time)	21.67	....
Large stone laid	....	....
Concrete laid	1,118.00	13,291.00
Total concrete laid	6,009.00	13,613.00

Permanent plant consisted of one chamber crane, averaging 0.84 units per day.

Auxiliary plant consisted of three ½-cubic yard mixers, daily average 2, and three 2-cubic yard mixers, daily average 2.52. Auxiliary placing plant consisted of five cranes and derricks, daily average 3.88 units, and a daily average of 1.76 mixers discharging directly into forms.

Miraflores Locks—Excavation for the culvert system, and the placing of concrete in the lower lock were continued during the month. Dry excavation was continued in the lower lock by the use of 8 steamshovels. The backfilling of the east and west lock walls, also filling on the east and west toes of the west dam were continued. The sinking of foundation caissons for the north center guide wall, and the construction of concrete caisson shells were continued. During the month the amount of iron placed aggregated 319,730 pounds.

Concrete Work—The total amount of concrete and large stone laid at Miraflores was 48,772 cubic yards, as compared with 41,726 cubic yards during November. The concrete was placed as follows: 549 cubic yards in the north center guide wall; 18,177 cubic yards in the east wall; 17,297 cubic yards in the center wall; 6,293 cubic yards in the west wall; and 6.456 cubic yards in the floors.

OPERATION OF THE PERMANENT AND AUXILIARY CONCRETE CONSTRUCTION PLANTS AT MIRAFLORES.

	Permanent Plant.	Auxiliary Plant.
Length of working day (hours)	12.00& 8.00	8.00
Average number of hours per day worked laying concrete and large stone (actual working time)	5.32	5.79
Average number of mixers per day	6.64	4.72
	Cu. Yds.	*Cu. Yds.*
Average hourly output per mixer (actual working time)	33.25	29.77
Average amount of concrete and large stone laid per hour, per berm, or chamber crane (actual working time)	50.14	....
Large stone laid	....	....
Concrete laid	39,228.00	9,544

Two berm cranes began 12-hour day on December 19.

Permanent plant consisted of 4 berm cranes, daily average 3.92, and 2 chamber cranes, daily average 1.96.

Auxiliary placing plant consisted of 3 locomotive cranes and derricks, daily average 1.40, and 3.68 mixers discharging directly into forms.

DISTRICT NO. 2—DREDGING.

The following is a statement of the output of the five dredges which were in operation during the month, and of the amount of material excavated hydraulically:

DREDGE	Type.	WORK.		PLANT.		Total.	Remarks.
		Earth	Rock.	Earth.	Rock.		
		Cu. Yds	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*	
Cardenas	Dipper	8,750	23,400	....	....	32,150	Place measurement
Marmot	Ladder	14,231	11,8 0	....	....	26,111	Place measurement
Badger	Ladder	137,771	....	....	....	137,771	Scow measurement
Mole	Ladder	1,900	12,750	....	....	14,650	Scow measurement

Total	....	173,150	48,030	....	....	221,180	
Hydraulic excavation	....	*57,780	....	....	....	57,780	Place measurement
Grand Total	....	230,930	48,030	....	....	278,960	

*Excavated from Canal prism, south of Miraflores lock site.

CHAMÉ SAND EXCAVATION.

Approximately 42,201 cubic yards of sand were excavated at Punta Chamé and delivered at Balboa.

DISTRICT NO. 3—MUNICIPAL AND SANITARY ENGINEERING.

The reservoirs, water mains, sewers, roads and oil pipe lines were maintained and extended as required to facilitate construction work.

Work was continued on the Panama street improvements.

DISTRICT NO. 4—ANCON QUARRY.

PERFORMANCE OF ROCK CRUSHER PLANT.

Length of working day (hours)	8.00
Average number of hours per day (actual working time)	7.37
Average number of cubic yards crushed per hour of working day	330.50
Average number of cubic yards crushed per working hour	358.58
Total output for the month, cubic yards	66,101.00

Relocation of Panama Railroad.

During the month 347,112 cubic yards of material were excavated, increasing the total excavation at the close of the month to 9,623,171 cubic yards, and 483,066 cubic yards of material were placed in embankment, increasing the total for this purpose to 15,644,584 cubic yards.

The daily average number of steamshovels at work was 10.4, and the total number of working days was 25.

For comparison with the work done by steamshovels during the preceding month, and during the corresponding month of the previous year the following table has been prepared:

Period.	Excavated by shovels.	Classification of material.		Av. No. of shovels at work.	W'kg days.	Av. yards per shovel day.
		Rock.	Earth.			
1910:	*Cu. Yds.*	*Cu. Yds.*	*Cu. Yds.*			*C. Y.*
Dec.	233,720	132,380	101,340	6.00	26	1,498
1911:						
Nov.	316,010	223,155	92,855	10.75	24	1,220
Dec.	345,520	197,355	148,165	10 40	25	1,329

No temporary trestle was driven during the month. Work on bridges and culverts was continued. Seven hundred and seventeen linear feet of 70-pound track were relaid with 90-pound track, the total of 70-pound and 90-pound track at the end of the month being 130,428 feet and 47,663 feet, respectively. The force averaged 2,379 men.

Quartermaster's Department.

LABOR.

There was a decrease in the force of Spanish laborers during the month. Some of them were repatriated, and some turned over to the Panama Development and Manufacturing Company.

QUARTERS.

All occupants have vacated Commission quarters in the San Pablo-Tabernilla District. Practically all the houses have been sold and most of them demolished. The two police stations at Tabernilla and San Pablo will be moved to points on the Panama railroad relocated line, and the Commissary at Tabernilla to Mount Hope. Assignment of the families from the San Pablo-Tabernilla District at other points has caused a temporary congestion in family quarters, and there are no vacancies at present.

BUILDING CONSTRUCTION.

The fire station at Cristobal and the commissary addition at Corozal were completed during the month. The cost of the Cristobal fire station was $13,602.29. Seven gangs are at work on the Tenth Infantry quarters at Las Cascadas, and most of these quarters will be completed within the month of January.

MATERIAL AND SUPPLIES.

Owing to a congestion in shipping circles in New Orleans and New York it has been difficult to secure deliveries on lumber and piling. Serious inconvenience has been caused by the delay on these shipments. The value of material received from the United States during the month was $860,021.90. Supplies during the month were delivered by 36 steamers, the total weight of cargo aggregating 25,813 tons, exclusive of 745,914 feet B. M. yellow pine lumber, 300,012 feet B. M. Douglas fir lumber, 46,201 feet B. M. white oak lumber, 536 pieces of piling, and 56,006 cross ties.

Subsistence Department.

The operation of the European laborers' messes, the colored laborers' kitchens and the line hotels showed a net profit of $1,374.60. The operation of the Hotel Tivoli showed a net profit of $3,771.58, and there was a net loss on restaurants, penitentiary, tugs and dredges of $35.92. The net profit on subsistence operations was $5,110.26.

Department of Civil Administration.

COURTS.

During the month one civil case was disposed of in the Supreme Court, 18 civil and 36 criminal cases in the Circuit Courts, and 67 civil and 537 criminal cases in the District Courts.

DIVISION OF POSTS, CUSTOMS, AND REVENUES.

Money order sales for December amounted to $427,480.48, and the fees to $2,051.27. Receipts from stamp and card sales, and newspaper postage aggregated $10,514.84. The total collection of revenues made by the Division was $52,401.51, and the collection on account of court fines, costs and fees, $3,279.68.

Twenty-seven vessels entered at and 28 vessels cleared from the port of Ancon; and 23 vessels entered at and 27 vessels cleared from the port of Cristobal.

DIVISION OF POLICE AND PRISONS.

The total number of persons arrested was 538, of whom 487 were men and 51 women. Twenty-three nations, or 45 separate states and dependencies were represented. The total number of arrests for the month was an increase of two as compared with the month of November. Thirteen convicts were committed to the penitentiary, and 9 were discharged, leaving 145 in confinement at the close of the month. The cost of guarding and subsisting the convicts was $2,997.84, and the value of their work on Canal Zone roads was $2,472.80.

DIVISION OF FIRE PROTECTION.

Sixteen fires were reported in the Canal Zone during the month, as compared with 10 in November. The damage to Commission property was $52.38, and to private property $26.00.

DIVISION OF PUBLIC WORKS.

In the City of Panama the average daily consumption of water was 1,526,719 gallons, and in Colon 1,100,426 gallons.

The usual inspection and maintenance work of this division was performed during the month.

DIVISION OF SCHOOLS.

Due to the holidays, the schools were in session but fifteen days. The net enrollment in the white schools during the month was 1,161, and the average daily attendance 977.2, or 84 per cent of the enrollment; and in the colored schools the net enrollment was 1,135, and the average daily attendance 703.9, or 62 per cent. Forty-six white and 26 colored teachers were employed in the division on December 31.

Department of Sanitation.

The total number of deaths from all causes among employes was 44. These were divided as follows: From disease, 24, and from violence, 20, giving the annual average per thousand of 5.68 and 4.74, respectively.

The annual average death rate per thousand among employes for the month of December in previous years since American occupation was as follows:

1904	19.44
1905	45.73
1906	30.27
1907	18.11
1908	25.03
1909	13.84
1910	10.91

The annual average death rate per thousand in the cities of Panama, Colon, and the Canal Zone, including both employes and non-employes, was 20.30.

The annual average death rate per thousand for the month of December among the same class of population for previous years was as follows:

1904	44.75
1905	58.78
1906	39.21
1907	28.50
1908	26.15
1909	21.50
1910	25.16

Segregating the whites from the blacks, the annual average death rate per thousand from disease among employes was, for whites, 5.71, blacks, 5.68, giving a general average of 5.68. For the same month during 1909, the annual average death rate per thousand from disease was, whites, 8.39, blacks, 10.67, giving a general average of 10.13, and for the same month during 1910, whites, 5.59, blacks, 8.79, giving a general average of 7.94.

Among employes during the month, deaths from the principal diseases were as follows: Amoebic abscess of liver, 1; dysentery, 3; lobar pneumonia, 4; malaria fever, E. A., 2; tuberculosis of the lungs, 3, leaving a balance of 11 deaths from all other diseases, and 20 deaths from external violence.

No cases of yellow fever, small pox, or plague originated on or were brought to the Isthmus during the month.

Respectfully,
GEO. W. GOETHALS, *Chairman.*

OFFICIAL CIRCULARS.

Canal Zone Census.

CULEBRA, C. Z., January 20, 1912.

CIRCULAR No. 429.

A census of the Canal Zone will be taken by the Department of Civil Administration under the authority of the Executive Order signed by the President, January 12, 1912. Same will be begun on, and taken as of date, February 1, 1912, and will be completed as soon after that date as may be possible.

To insure the success of this undertaking the cooperation of all departments and divisions of the Isthmian Canal Commission and the Panama Railroad Company is imperative, and it is directed that all employes of the Commission and the Railroad Company called upon shall furnish such information and assistance to the Census Division as may be possible.

GEO. W. GOETHALS,
Chairman, Isthmian Canal Commission.
President, Panama Railroad Company.

Half Rate Mileage Books.

CULEBRA, C. Z., January 16, 1912.

CIRCULAR No. 420-B:

Half rate mileage books must be purchased before the arrival of passenger trains at stations. Agents will not be required to issue these books after a train arrives.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

GENERAL.

The following is the schedule for moving picture entertainments for the week January 29 to February 3: Monday, Cristobal; Tuesday, Gatun; Wednesday, Gorgona; Thursday, Corozal; Friday, Empire; Saturday, Culebra.

Official results of the Telephone Athletic Meet, held on January 19, 1912, follow:

Fifteen Yard Dash—1st, Mathews, Gatun, $1\frac{4}{5}$ seconds; 2nd, Ellsworth, Culebra, 2 seconds; Flynn, Gorgona, 2 seconds. (The two men tied with 2 seconds ran over with the same results. Therefore the points were divided, Culebra getting 2, and Gorgona 2.)

Shot Put—1st, MacDonald, Empire, 43 feet 8 inches; 2nd, Anderson, Camp Elliott, 38 feet 4 inches; 3rd, Mabstedt, Gatun, 37 feet 4 inches.

Running High Jump—1st, Koperski, Cristobal, 5 feet 6 inches; 2nd, Vance, Cristobal, 5 feet 4 inches; 3rd, Sherrard, Gatun, 5 feet $2\frac{1}{2}$ inches.

Running Broad Jump—1st, Thompson, Camp Elliott, 17 feet $11\frac{1}{2}$ inches; 2nd, Vance, Cristobal, 17 feet 9 inches; 3rd, Greene, Cristobal, 17 feet 7 inches.

Three Standing Broad Jumps—1st, Cornthwaite, Culebra, 30 feet $2\frac{1}{2}$ inches; 2nd, Dirkle, Camp Elliot, 29 feet 6 inches; 3rd, Robinson, Gorgona, 28 feet 7 inches.

Relay Race (eight men)—1st, Culebra, $39\frac{3}{5}$ seconds; 2nd, Gorgona, $40\frac{3}{5}$ seconds; 3rd, Empire, $42\frac{3}{5}$ seconds. Only 5 points given in this event.

Points won as follows: Cristobal, 12; Culebra, 12; Camp Elliott, 11; Gatun, 7; Empire, 5; Gorgona, 3; Corozal, 0. Cristobal and Culebra tied for first place, each making 12 points: the referee, W. H. Warr, tossed a coin to decide first place, Cristobal winning the toss. Entries—Camp Elliott, 17; Gorgona, 15; Culebra, 14; Empire, 12; Gatun, 7; Corozal, 4.

COROZAL.

Names are being received for the Handicap Pool Tournament. The winners of first, second, and third places will receive prizes.

Illustrated song slides were shown at the moving picture show last week. Mr. Case of Culebra sang three songs, and Mrs. Hinton accompanied at the piano.

Thirty-five new phonograph records and 38 new library books have been received at the clubhouse this month. Another order for library books is now being filled in the States.

CULEBRA.

The following is the standing of the Duck Pin Tournment today by number:

Captain.	Score	Captain	Score
Baumer	2,484	Silver	1,339
Smith	2,461	Driscoll	1,295
Coppin	2,457	Crain	1,194
Wheeler	2,549	Kersey	1,226

At the "smoker" on Thursday evening over 200 men were present. Orchestral music during the evening was furnished by the 10th Infantry Orchestra. The program consisted of a balancing stunt, Mr. Tudor; readings and songs, Mr. Christian; bass solo with colored slides, Mr. Case; wrestling match, Greening and Lutral of Empire; minstrel sketches, Emery and Cogan. Popular songs were sung and refreshments were served at the close of the entertainment.

EMPIRE.

The bowling tournament in duck and candle pins which started January 15 has 25 entries and the high score for six games, three in duck pins and three in candle pins, bowled by Rodeigheiro and Pinney, was 1,144. The high single score was made by Rodeigheiro, 126.

The monthly handicap pool tournament in which there were 25 entries was won by D. McKeever.

There was a large attendance Saturday evening, January 20, to see the pool games between the Gatun players and the Empire men. Gatun was represented by DePoorter and Dalton and Empire by Hirsh and Pearson. DePoorter won his game from Hirsh, and Pearson won from Dalton. The Empire men will go to Gatun on Saturday, January 27, for a return game. The scores were as follows: DePoorter, 125, Hirsh 42; Dalton 92, Pearson 125. High runs, DePoorter 27, Hirsh 14, Pearson 15-15-15, Dalton 15.

GORGONA.

Starting next Monday night, January 29, there will be formed both Spanish and French classes. Mr. Henry Page of Colon will be the teacher. The classes will meet every Monday and Thursday night at 7.30. Miss Osario will teach classes in Spanish, Tuesday and Friday afternoons at 2.30. This class will be for men and women who would like to learn Spanish and can meet to study during the day.

Volley ball practice is held every Monday night at 7.30. This is considered one of the best games known for the tropics. A representative team will play a game with Empire on the Empire floor, on Saturday, January 27.

The Checker Club held a smoker last Thursday night, January 19. W. I. Hosden, president, and M. S. Fox, secretary, served the refreshments.

The following moving pictures will be shown next Saturday night: Pineapple Cannery in China, Betty's Apprenticeship, Her Artistic Temperament, The Lass Who Could'nt Forget, A Fatal Resemblance, Billy's Valentine.

GATUN.

Two new Spanish classes were organized on Wednesday, January 17.

Six 19-ounce jointed ivory-tipped pool cues have been received from the States and can be purchased by any member at $2.50 each.

The local rag-time duck pin tournament closed Tuesday evening, January 16, with two teams tied at 603 pins each. The results of the roll-off are: MacKelly, 96, 88, 79,—263; Durand, 106, 93, 93—292, total 555. Vierbuchen, 82, 93, 91—266; Severn, 75, 88, 77—240, total 506.

The following high scores in duck pins were rolled during the past week: Hughes, 127; Gamble, 110; Coleman, 113; Walters, 115; Vierbuchen, 115, 114; Dalton, 115, 110.

CRISTOBAL.

On Saturday, January 20, in the indoor baseball game the boys of Cristobal scored 29 to the Gatun boys 6; basket ball in the afternoon, Cristobal 19, Gatun 9. Cristobal also won all three games in the bowling match. Arrangements are being made for a return series at Gatun.

The subject to be discussed at the session of the Debating Club to be held on Wednesday evening, January 31, will be resolved that "The Country Boy has More Advantages than the City Boy." All men are invited to attend these sessions of the Debating Club whether members or not.

BASEBALL.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, JANUARY 31, 1912. No. 23.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Cargo-Handling Appliances at Terminal Docks.

A committee has been appointed to consider and report upon the facilities to be provided on the terminal docks at Balboa and Cristobal for the convenient and economical unloading and loading of vessels, and the transfer and storing of such freight as may be considered necessary. The work of the committee will include the arrangement of all tracks on wharves and piers, all matters connected with cranes and other cargo-handling appliances, and the general characteristics of all wharf and pier superstructures. The committee consists of Col. H. F. Hodges, Civil Engineer, U. S. N., H. H. Rousseau, Mr. S. B. Williamson, and Mr. J. A. Smith.

Use of Relocated Line.

Beginning on February 15, the relocated line of the Panama railroad will be used for all trains between Gorgona and Gatun, and the removal of the present track will begin shortly thereafter in order that it may be entirely out of the way by April, when Gatun Lake will begin to rise to the fifty-foot level. Between Gorgona and Panama the present line will continue in service until the Canal work is approximately completed. Trains will cross from the present to the relocated line by means of the tracks on top of the dike at Gamboa, which separates the waters of the Chagres from Culebra Cut. These tracks are now being regraded and ballasted.

Each southbound train will back across the dike at Gamboa and over a cross-over to the southbound track of the present main line. It will stop at Matachin and then back into Gorgona, 1.41 miles north, after which it will go ahead on the southbound track on the way to Panama. A northbound train will stop at Matachin, continue to Gorgona, and will then back along the northbound track to Gamboa Junction, whence it will go ahead toward Gatun. Such switching necessitates additional travel for through passengers; the distance from Gorgona to Gatun by the relocated line is 33.17 miles, or 4.90 miles more than by the present route. This will increase the schedule 10 minutes, making the time to cross from Colon to Panama, 2 hours and 25 minutes. Fares will be based on the actual distance traveled except that no additional charge will be made on fares between stations north of Matachin and stations south of Matachin, for the movement between Matachin and Gorgona.

For the present the only regular stop on this section of the relocated line will be at Monte Lirio, 8.02 miles south of Gatun, where the railroad crosses the Gatun River, though flag stations may be determined on later. A station is being constructed at Monte Lirio out of materials from the stations at Lion Hill and San Pablo, removed from the present line. Other stations to be abandoned are Bohio, Frijoles, Tabernilla, and Mamei.

First-aid Packets.

The Sanitary Department is issuing first-aid packets to be placed on all locomotives, steamshovels, dredges, cranes, and boats of the Commission and the Panama railroad. Each packet is of the type provided for knapsacks in the United States Army, and contains, within a waterproof wrapper, 2 compresses of antiseptic gauze, 2 small bandages of antiseptic gauze, 2 safety pins, sterilized, and a triangular bandage by means of which a compress may be held in place on the head or any portion of the trunk or limbs. The weight of the packet is a few ounces and its dimensions are 4 by $2\frac{1}{2}$ by $1\frac{1}{2}$ inches, making it pocket-size.

Pedro Miguel Dam.

In the construction of the dam at Pedro Miguel, between the lock and Cerro Luisa, to the west, the rock fill for the south toe has been brought to full height, 85 feet above sealevel, and the first trainload of selected clay for the core was dumped along the inner side of this toe on January 26. During the last dry season the core for the eastern half of the dam was laid to within about 10 feet of its final height. Since the first of January a trench, twenty feet wide, has been cut through the natural soil to rock, along the center line from the west end. Puddling selected material in this pit is designed to make a firm and impervious core. Clay will be dumped from the toes and washed to the center by jets from hose. For the work of placing spoil there is a straight track on the south toe from which Lidgerwood flat cars are unloaded. On the north toe Western dump cars are now used but in a short time the toe will be so widened that a straight track may be laid.

In order that this material may join closely with the portions of core which have already been placed, the surface of the latter is being raked of swamp grass and plowed and will later be harrowed and raked, to make it porous and to remove matter, which by decaying would tend to make the core unfirm. Since being laid, a year ago, the clay has become so hard that four mules are required to draw a plow through it.

North Approach to Gatun Locks.

The cofferdam across the lower end of Gatun Locks will be tested this week, when water will be pumped into the space between it and the hill which lies just north of the lock site, where the approach and wing walls will extend. When the dam has been shown to be watertight, two pipeline suction dredges will make their way toward the locks and begin excavating for the approach and wing walls. The spoil will be piped into a lagoon east of the main line of the Panama railroad, levees for which are now being constructed with spoil from the steamshovels at Mindi. After the suction dredges have removed about 750,000 cubic yards of earth at the sites for the walls, a dipper dredge will be employed for excavating rock down to the foundation level.

A pit is being made alongside the canal into which this rock will be dumped. This is the most economical means of disposing of it, because the work will be done while the old line of the railway from Mindi to Gatun Dam is still in operation and this makes it impossible to tow spoil out to sea. The pit, which is being excavated by the 18-inch suction dredge *No. 4*, will be about 350 feet long, 120 feet broad and 30 feet deep. When the pit is finished, *No. 4* will proceed to excavating for the walls, in which it will be assisted by the 20-inch suction dredge *Sandpiper*.

Anchorage Basin at Gatun.

It has been determined that the embankment across the anchorage basin in Gatun Lake at the south end of the Gatun Locks, on which the present line of the Panama railroad runs, will be removed down to 35 feet above sealevel during the present dry season, as soon as the railroad begins to use the relocated line. This will involve an excavation of about 25,000 cubic yards. It is probable that the spoil will be dumped upon the Gatun Dam.

Sills for Emergency Dams.

The sill for the emergency dam in the east chamber of the upper lock at Miraflores has been completed and work is advancing on the corresponding sill in the west chamber. At Pedro Miguel the reinforcement for both sills has been placed and the laying of concrete will proceed immediately. In the construction of one of these sills a pit 55 feet wide and extending the full distance of 110 feet between walls is excavated to the depth of $11\frac{1}{3}$ feet below the level of the approach floor. The sill is laid in the lower side of this pit for a width of 25 feet and rising 24 inches above the surface of the floor. About 1,200 cubic yards of concrete are required. The reinforcement consists of two rows, about 8 feet apart, of

NOTES OF PROGRESS.

(Continued.)

70-pound steel rails, set on one-foot centers and inclined toward the lower end of the lock at an angle of 60 degrees with the horizontal. On the upper side of the sill are 12 steel castings for the ends of the girders which will be let down from the cantilever bridge, which will be swung over the chamber from the side wall when it is desired to use the emergency dam. Each recess is 16 inches wide, with a mouth flaring to a width of 40 inches, to guide the swinging girder into the recess. Scope for the swing of the girders is afforded by the open portion of the pit above the sill, 30 feet wide. Over this a thin concrete floor is laid, and in addition to affording play for the girders, it provides a settling basin for silt.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 77 per cent completed, 174,333 cubic yards, out of a total of 225,000, having been placed at the close of work on January 27. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked	No. Mixers.
January 22	440	16.00	2
January 23	540	16.00	2
January 24	348	16.00	2
January 25	576	16.00	2

January 27	552	16.00	2
Total	3,028	96.00	2
Previously reported	171,305		
Grand total	174,333		

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending January 27, follows:

DATE.	Hours worked.	Cubic Yards.
January 22	2.53	1,358
January 23	3.08	1,687
January 24	4.24	1,939
January 25	3.29	1,620
January 26	4.15	1,894
January 27	4.22	1,992
Total	22.31	10,490

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending January 27, follows:

DATE.	Hours worked.	Cubic Yards.
January 22	7.00	2,511
January 23	6.25	2,260
January 24	6.10	2,181
January 25	4.10	1,755
January 26	5.45	1,457
January 27	5.40	1,917
Total	35.10	12,081

American Institute of Electrical Engineers.

A party of members of The American Institute of Electrical Engineers and their friends, 110 persons in all, arrived on the Isthmus on January 25, for an inspection of the Canal work. They will return to the States on February 1. On Saturday night, January 27, they were guests of the Tivoli Club at the fortnightly dance, and on Monday night the visitors gave a dance at the Hotel Tivoli to their hosts of the 27th. Resolutions were adopted at a meeting of the members of the Institute expressing appreciation of the Canal work, and of Canal Zone hospitality.

Postal Savings System

In accordance with Executive Order of September 8, 1911, postal savings certificates will be on sale, beginning February 1, at the following Canal Zone post offices: Ancon, Balboa, Bas Obispo, Corozal, Cristobal, Cristobal A (Porto Bello), Cristobal B (Toro Point), Culebra, Empire, Gatun, Gorgona, Las Cascadas, Matachin, Miraflores, Paraiso and Pedro Miguel. The rules governing the system were published in THE CANAL RECORD of November 22, 1911.

CONCRETE WORK IN THE LOCKS.

Over 77 per cent of the concrete for the locks is in place, the amount at the close of work on January 27, being 3,237,022 cubic yards, out of a total of approximately 4,199,400. A total of 20,281½ cubic yards of concrete was laid in the locks during the week ending January 27.

GATUN LOCKS.

Over 89 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on January 27 being 1,796,746 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending January 27, and of the total, follows; and similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue. The construction plant works 12 hours, daily, and the auxiliary plant 9 hours.

*The 256½ yards shown for the portable mixers are reinforced concrete and were placed on the following days: January 22nd, 38; January 23rd, 58; January 24th, 38½; January 25th, 45; January 26th, 22; January 27th, 55.

PEDRO MIGUEL LOCK.

Concrete work in the lock at Pedro Miguel is over 95 per cent completed, 803,361 cubic yards, out of a total of 837,400, bucket measurement, having been placed at the close of work on January 27. The record for each of the six 8-hour working days of last week, follows:

DATE.	AUXILIARY PLANT.						Large stone.	Total.
	2-cubic yard mixers.			½-cubic yard mixers.

MIRAFLORES LOCKS.

Over 46 per cent of the concrete for the system of two twin locks at Miraflores was in place on January 27, the total amount on that date being 637,195 cubic yards, bucket measurement, out of a total of approximately 1,362,000. The record for each of the six 8-hour working days of last week, follows:

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT.							Total.
				2-cubic yard mixers.			½-cubic yard mixers.

FEDERATED WOMEN'S CLUBS.

Annual Meeting at Cristobal and Election of Officers.

The fifth annual meeting of the Canal Zone Federation of Women's Clubs was held at Cristobal on Saturday, January 27. The business meeting convened in the entertainment hall of the Commission clubhouse at 9.30 o'clock. The hall had been attractively decorated by the social committee of the Cristobal Woman's Club, a variety of tropical flowers, palms and ferns being used, while at the end two American flags were displayed, and over the stage hung the green and gold banner of the Canal Zone Federation.

Mrs. Carl H. Elliott, president of the Cristobal Club, welcomed the delegates.

The president of the Federation in her address stated that in view of the decrease in the number of federated clubs, owing to the drawing to a close of the Canal construction, it would be well to look into the question of the discontinuance of the federation, and urged that this and other questions be given serious consideration. It subsequently developed however, in the enthusiastic spirit with which plans for future activity were made, that the time for the consideration of disbanding the federation had not arrived. Among the reports of the committees the two most important were that of the librarian and custodian, and that of the chairman of the health committee of the Cristobal Woman's Club, which was made by request.

The librarian stated that 50 books of the Federation juvenile library had been lent to Gorgona for several months, where they had been circulated among the school children; a portion of the library had been lent to the woman's club at Gatun, and 150 books are at present in circulation in the Cristobal Union Sunday School. The Federation's pictures have been exhibited in Paraiso, Gorgona, and Cristobal; there was also a loan exhibit extending over a period of two weeks in the Gorgona public school in May.

The chairman of the health committee of the Cristobal club gave a detailed report of the free health lectures in Colon. The primary object of this work was to institute an anti-tuberculosis campaign among the poor people of the city, by means of free illustrated lectures, the circulation of literature and the posting of bulletins giving simple rules for health and sanitation in the hall-ways and alleys in the crowded districts of the city. In this connection lectures on related subjects are also given, such as the transmission of disease by insects, and general house sanitation. The Federation assured the committee of its cooperation and means will be taken whereby the work can be brought into the native villages in the Canal Zone.

The reports of the club presidents showed good work along civic, philanthropic and social lines—playgrounds established, sanitary fountains in prospect, charity balls given, and Christmas entertainments planned and carried out, being among the prominent features. The questions regarding the common drinking cup, and the administration and conservation of the public playgrounds, "rational recreation centers," were discussed. In response to a demand for Federation pins, the delegates authorized the purchase of an additional supply. These will be ordered at once and requests for the same may be filed with the treasurer at any time. Members are also urged to purchase General Federation pins; orders for these may also be placed with the treasurer.

The Federation pledged itself to raise $300 for one year's schooling in an institution for a blind boy, fourteen years old, who is at present in Colon Hospital. The boy is bright and promising, willing and eager to learn, and to become self-supporting. The ultimate object is that the boy may be trained in some work whereby he will be independent, and may return to the Isthmus to teach and work among the blind of his own people. The money is to be raised by the first of April, in order that the boy may be placed in the school at the opening of the next school year. The required bond, to enable him to enter the United States, and his clothing have been assured.

A recess was taken at 11.30 for lunch, which was served at the Washington Hotel.

The hall was filled for the afternoon session which convened at 2.30 o'clock. Besides the Federation women, there were present members of 15 Canal Zone organizations of women, representing church societies and guilds, auxiliaries, and secret orders. The Little Workers, Gorgona's club of girls, attended in a body, and the staff of the Canal Zone Public Schools, including the supervisors, was present.

Among the speakers was Dr. Caroline Rosenberg, representing the California Woman's Club. The following was the program:

President's Address	Miss Beattie
Greeting from California	Dr. Caroline Rosenberg
Cecelian Quartet of Cristobal Club:	
(*a*) Nights of Music	Denza
(*b*) Scheiden ohne Leiden	Dvorak
Address	Judge Thomas E. Brown, Jr.
"Progress in the Prevention of Crime."	
Piano Solo	Mrs. Ullrich
(*a*) Traumerei	Schumann
(*b*) Mazurka	Godard
Address	Mr. Frank A. Gause
"Literature as a Factor in Education."	
Cecelian Quartet of Cristobal Club:	
(*a*) Barcarolle	Offenbach
(*b*) O'er the Sands	Abt

Refreshments were served by the house committee of the Cristobal Woman's Club. The following officers were elected for the ensuing year: President, Miss J. Macklin Beattie; first vice-president, Mrs. E. H. Colip; second vice-president, Mrs. Charles H. Stoddard; third vice-president, Mrs. A. O. Herman; recording secretary, Mrs. Carl H. Elliott; corresponding and General Federation secretary, Mrs. Thomas E. Brown, Jr.; treasurer, Mrs. J. E. Westberg; auditor, Mrs. S. E. Calvit; librarian and custodian, Mrs. M. E. Smith.

Ancon Study Club.

The Ancon Study Club, an organization of women, was organized at Ancon on Wednesday afternoon, January 24. The meetings will be held weekly on Thursday afternoons at Ancon Hall at 3 o'clock. In connection with the work of the club, the library, formerly the property of the Ancon Library Association, has been taken over and will be placed in circulation among the members, or by special arrangement, among non-members. Mrs. H. W. Shick of Corozal was elected secretary-treasurer, and Mrs. Mark White of Ancon, librarian. The secretary is empowered to call the meetings to order, and to call special meetings, upon request of the members. Each meeting will be presided over by the hostess for the day, who will arrange the work and outline the program for the following meeting, assigning the members such papers as are to be prepared in connection with the subject. For the first month, the study will be Panama. As outlined, the work begins with the outline of the early history, and, continuing, reviews the French occupation, the beginning of the American occupation, and the Canal up to date. A history of the Panama railroad will also be taken up for one afternoon. The next meeting of the club will be at Ancon Hall on Thursday, February 1, at 3 p. m.

Kangaroo Memorial Services.

The annual memorial services of the Independent Order of Panamanian Kangaroos will be held in the National Theatre in Panama on Sunday, February 4, at 3 p. m. All Kangaroos and the public are invited to attend. A special train will be run, leaving Colon at 12.30 p. m. It will arrive in Panama at 2.15; returning, it will leave Panama at 6.30 and arrive in Colon at 8.10 p. m. No transportation will be required on this train into Panama; return tickets will be given out at the theatre after the services.

Steam Shovel Men.

The January meeting of Panama Local No. 5 of Steam Shovel Men has been postponed to Sunday, February 4, in order to receive the report of the delegate to the annual convention in Chicago. The meeting will be held in the annex to the Administration Building at Culebra.

B. P. O. E.

All Elks are requested to aid in an effort to complete a list of local members by sending at once name and number to the undersigned, indicating also names of any known members now removed from the Isthmus.

GERALD D. BLISS, Culebra.

Changes in British Consular Service.

The British Vice-Consulate at Colon has been raised to the rank of Consulate, with jurisdiction in the Republic of Panama and the Canal Zone, and the former vice-consul, Mr. Harry Owen Chalkley, has been made consul. A vice-consulate will be maintained in the British legation at Panama, with Mr. D. F. S. Filliter in charge; and the whole service in Panama will be under the direct supervision of the British Minister, Sir Claude Coventry Mallet.

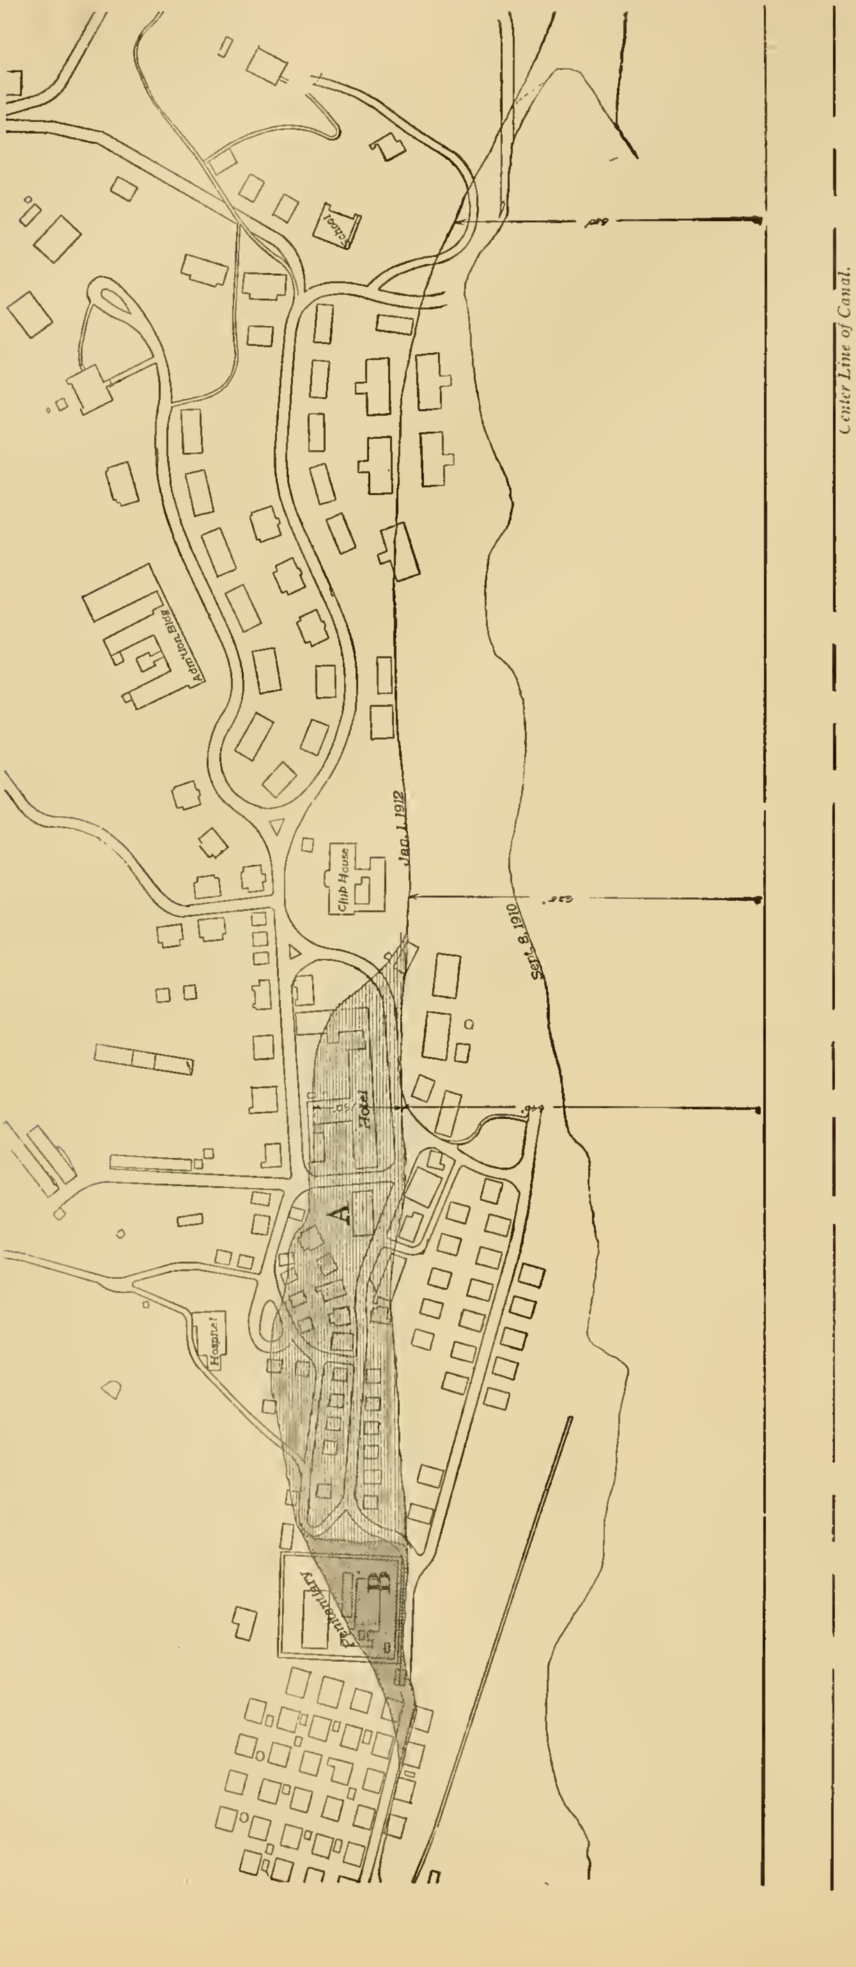
St. Louis Business Men's League.

A party composed of 126 members of the St. Louis Business Men's League and members of their families, in all about 160 persons, will arrive on the Isthmus on February 15, by way of New Orleans. They will remain here one week.

PERSONAL.

Col. Geo. W. Goethals sailed on the *Cristobal* on January 28 for New York. He is going to Washington on official business and expects to be absent about three weeks.

William Barclay Parsons, who was a member of the first Isthmian Canal Commission in 1904, and of the International Board of Consulting Engineers on the Panama Canal, 1905-1906, arrived on the Isthmus on January 27, accompanied by Mrs. Parsons and a party of friends, and sailed for Jamaica on January 30.



CULEBRA SLIDE—Lines showing Breaking Off on West Side of Culebra Cut Since 1910.

(A)—Area about 4 acres. Excavation to be made above elevation 280 about 230,000 cubic yards. Buildings removed. (B)—Area about one acre.

CULEBRA SLIDE.

Gradual Encroachment Upon the West Bank on which Culebra Village is Situated.

Plans for work on the slide at Culebra during the present dry season include a continuation of excavation from the top of the bank, with the purpose of lightening the mass that shows signs of having broken away from the main hill, and thus lessening its tendency to move of its own weight into the prism of the canal.

To do this the area on which the Culebra hotel was formerly situated, and that where the lodge hall and church and a number of small family quarters now stand, must be excavated In all, twenty-nine buildings will be removed within the ensuing two months to make way for the steamshovels. The gradual encroachment of the slides upon the side of the hill, and the number of buildings it has been necessary to remove on this account, or in order to make way for steamshovels, are indicated on the map published herewith. Prior to 1905 the main line of the Panama railroad ran between the old village of Culebra and the line of the canal, crossed the canal at the south end of Gold Hill, between miles 36 and 37, and ran along the east bank into Paraiso. The construction of the canal necessitated the removal of the railroad from the old location, east of the village, to behind the hill on the west. In 1906 the headquarters of the work were moved from Ancon to Culebra, and the new village of Culebra was constructed on the east slope of the hill, as the old camp had been, but at such a distance from the Cut as to be apparently safe from danger of sliding in. Part of this location has already disappeared on the slide. The old line of the railroad was maintained practically intact until 1909, however, when the slides began seriously to interfere with it.

The section it is now intended to excavate includes all that between the penitentiary on the south, the Commission Clubhouse on the north, and on the west the road that runs from the American settlement at Culebra to the labor camp, known as Rio Grande, an area of about 4 acres. In addition to this area it is probable that the site of the penitentiary and a portion of the labor camp of Rio Grande will need to be removed at a later date. Along the edge of Zion Hill, back of the penitentiary, there is a long crack in the earth that is typical of the breaks occurring in this class of slide. In some parts it is from six inches to a foot wide. It is apparent that the toe of the hill has broken away from the main mass, and the depth of the break can only be conjectured; at places it can be sounded to twenty feet below the surface.

In the French canal days one of the springs that supplied water to the labor camp emptied into a cistern near the present penitentiary, and a tiny stream of water now runs out of the ground along the line of the crack. If this spring is local it will have little effect on the movement of the detached mass, but if it represents the collection of a number of smaller streams from various parts of the hillside, it is probable that the movement will be accelerated by the slickening of the mass along the line of the break. The material along the break appears to be soft rock, of the kind that becomes "greasy" when in contact with water. In order to determine whether this water was not largely leakage from the reservoir on top of the hill, the reservoir was emptied some time ago, but during the time that it was empty there was little if any lessening of the volume of the stream, indicating that the water comes from a spring or springs in the hill.

There are cracks in the ground underneath the buildings of the penitentiary, but it is not proposed to vacate and demolish the buildings until this becomes absolutely necessary. They are in no danger because they stand well back from the edge of the slide. It is expected also that it will be necessary to move part of the labor camp of Rio Grande because the limits of the slide include the northern end of this settlement. This will likewise be work for some future time, because there is no immediate danger of the bank in this section settling enough to make the buildings insecure

The action of the slides in front of the village of Culebra has been gradual, and has developed during the past five years. Early in the excavation it became evident that the theoretical slopes of 3 on 2 above the 40-foot berm at the 95-foot level, and 2 on 3 slopes above the 40-foot berms at the 200 to 230-foot levels, could not be maintained. At first the method pursued was to dig in the prism of the Canal, and allow the material from the banks to slide in, after which it would be excavated. The continual pushing out of line of the railway tracks and filling of the drainage ditch by this movement led to a modification of this method, and the adoption of the plan of lightening the slide by taking as much material as possible from the top of it. This method has undoubtedly retarded the movement, and it will probably result in saving a considerable amount of excavation. What the final slopes here will be cannot be determined accurately at this time, but it is probable that they will be steeper than 1 on 3.

It is estimated that the total amount of material removed from the slides on the west bank at Culebra is 4,769,957 cubic yards; and that there still remain within the area 2,335,905 cubic yards, most of which may require moving. In all the slides in Culebra Cut, there remain to be excavated about 3,696,000 cubic yards, or about one-fourth of the total remaining excavation for the Cut, which on January 1, 1912, was 14,941,181 cubic yards.

Postal Business and Canal Zone Revenues.

During the month of December there were sold 21,269 money orders amounting to $427,483.48. Of this amount, $328,981.20 was issued payable in the United States, $97,800.32 in the Canal Zone, $600.71 in Martinique, and $101.25 in Costa Rica. The fees amount to $2,051.27, and the amount paid and repaid to $113,392.71.

Postal sales during the month amounted to $10,494.80, and newspaper postage to $20.04.

Revenue collections during the month were as follows:

Bicycle and chauffeur licenses	$ 27.00
Distillation	278.00
Escheated estates	2.00
Insurance collections	50.00
Motor vehicle licenses	92.00
Retail liquor licenses	26,400.00
Steamboat inspection	15.15
Taxes, licenses, etc	12,970.45
Total	$39,835.30

The Pacific Division sand service will furnish 400 cubic yards of sand a day to the Atlantic Division for use at Gatun from this time until April 1, 1912.

CANAL ZONE CENSUS.

Regulations Governing the Work—Enumeration to Begin This Week.

The second census of the Canal Zone will be begun on February 1, when 30 enumerators acting under the direction of four supervisors will begin the work of enumeration. This will be carried on in four districts, corresponding with the administration districts, and the work in each district will be done under direction of a supervisor, who in turn will be under the supervision of two experts from the Bureau of the Census at Washington, and the Assistant Chief Clerk of the Department of Civil Administration. All but two of the enumerators have such facility in speaking Spanish as will enable them to ask questions of practically all the people in their districts, and a few of them speak French, German, or Italian. The Executive Order and Official Circular governing the Census follow:

EXECUTIVE ORDER.

By authority invested in me by law, I establish the following order for the Canal Zone:

Section 1. A census of the Canal Zone, Isthmus of Panama, shall be taken by the Department of Civil Administration of the Isthmian Canal Commission not later than April 30, 1912, under such rules and regulations in conformity with this order as may be prescribed by the Head of Department of Civil Administration with the approval of the Chairman of the Isthmian Canal Commission.

Section 2. The census shall embrace inquiries relating to population, and shall include for each inhabitant the name, location, sex, color, age, conjugal condition, place of birth, citizenship, length of residence in the Canal Zone, occupation, whether or not an employe, and if an employe of the Isthmian Canal Commission, the Panama Railroad Company, the United States Government, or of any arm or branch thereof this fact to be shown, together with metal check number if an employe of the Isthmian Canal Commission or the Panama Railroad Company, school attendance, literacy, the language spoken, whether blind, deaf and dumb, insane, or imbecile, and any other information which, under the rules and regulations referred to in Section 1, may be required.

Section 3. It shall be the duty of each enumerator to visit personally each dwelling house in his subdivision, and each family therein, and each individual living out of a family in any place of abode, and by inquiry made of the head of each family, or of the member thereof deemed most competent and trustworthy, or of such individual living out of a family, to obtain each and every item of information and all particulars required by this Order; and in case no persons shall be found at the usual place of abode of such family, or individual living out of a family, competent to answer the inquiries made in compliance with the requirements of this Order, then it shall be lawful for the enumerator to obtain the required information as nearly as may be practicable from families or persons living in the neighborhood of such place of abode. It shall be the duty also of each enumerator to forward the original schedules, properly filled out and duly certified, to the supervisor or other chief census officer of his district as his returns under the provisions of this Order; and in the event of discrepancies or deficiencies being discovered in these schedules he shall use all diligence in correcting or supplying the same.

Section 4. The compensation of enumerators and other persons engaged in taking the census shall be fixed by the Head of Department of Civil Administration, subject to the approval of the Chairman of the Isthmian Canal Commission.

Section 5. Every supervisor, supervisor's clerk, enumerator, interpreter, special agent, or other employe shall take and subscribe to an oath or affirmation to faithfully execute the duties imposed by his employment.

Section 6. Any supervisor, supervisor's clerk, enumerator, interpreter, special agent, or other employe, who, having taken and subscribed to the oath of office required by this Order, shall, without justifiable cause, neglect or refuse to perform the duties enjoined on him by this Order, shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be fined not exceeding five hundred dollars; or if he shall, without authority of the officer in charge of the census, publish or communicate any information coming into his possession by reason of his employment under the provisions of this Order, he shall be guilty of a misdemeanor and shall upon conviction thereof be fined not to exceed one thousand dollars, or be imprisoned not to exceed two years, or both so fined and imprisoned, in the discretion of the court; or if he shall wilfully and knowingly swear to or affirm falsely, he shall be deemed guilty of perjury, and upon conviction thereof shall be imprisoned not exceeding five years and be fined not exceeding two thousand dollars; or if he shall wilfully and knowingly make a false certificate or a fictitious return, he shall be guilty of a misdemeanor, and upon conviction of either of the last named offenses he shall be fined not exceeding two thousand dollars and be imprisoned not exceeding five years; or if any person who is or has been an enumerator shall knowingly or wilfully furnish, or caused to be furnished, directly or indirectly, to the officer in charge of the census, or to any supervisor of the census, any false statements or false information with reference to any inquiry for which he was authorized and required to collect information, he shall be guilty of a misdemeanor, and upon conviction therof shall be fined not exceeding two thousand dollars and be imprisoned not exceeding five years.

Section 7. It shall be the duty of all persons over twenty-one years of age when requested by the officer in charge of the census, or by any supervisor, or enumerator acting under the instructions of the said officer in charge of the census, to answer correctly, to the best of their knowledge, all questions on the census schedules applying to themselves and to the family to which they belong or are related; and any person over twenty-one years of age who, under the conditions hereinbebefore stated, shall refuse or wilfully neglect to answer any of these questions, or shall wilfully give answers that are false, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not exceeding one hundred dollars.

And it shall be the duty of every owner, proprietor, manager, superintendent, or agent of a hotel, apartment house, boarding or lodging house, tenement or other building, when requested by the officer in charge of the census, or by any supervisor, or enumerator, acting under the instructions of the said officer in charge of the census, to furnish the names of the occupants of said hotel, apartment house, boarding or lodging house, tenement, or other building, and to give thereto free ingress and egress to any duly accredited supervisor or enumerator, so as to permit of the collection of statistics for census purposes including the proper and correct eumeration of all persons having their usual place of abode in said hotel, apartment house, boarding or lodging house, tenement, or other building; and any owner, proprietor, manager, superintendent, or agent of a hotel, apartment house, boarding or lodging house, tenement, or other building who shall refuse or wilfully neglect to give such information or assistance under the conditions hereinbefore stated shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not exceeding five hundred dollars.

Section 8. The circuit courts of the respective circuits shall have jurisdiction of the offenses herein enumerated.

Section 9. This Order shall take effect on this date.

WM. H. TAFT.

THE WHITE HOUSE,
January 12, 1912.

OFFICIAL CIRCULAR.

A census of all persons residing in the Canal Zone or employed by the Isthmian Canal Commission or the Panama Railroad in the Canal Zone, but residing outside the Canal Zone, or employed by the Isthmian Canal Commission or the Panama Railroad Company at Porto Bello, Nombre de Dios, Chame, and other like points in Isthmian territory, will be taken by the Department of Civil Administration as of February 1, 1912.

The purpose of the census is to secure general statistical information regarding the population of the Canal Zone, and replies are required from individuals only in order to permit the compilation of such general statistics. The census has nothing to do with taxation, with army or jury service, with the compulsion of school attendance, with the regulation of immigration, or with the enforcement of any law or ordinance, nor can any person be harmed in any way by furnishing the information required. There need be no fear that any disclosure will be made regarding any individual person or his affairs. All persons are therefore urged to answer promptly, completely, and accurately all inquiries addressed to them by the enumerators or other employes connected with the census work, and thereby to contribute their share toward making this necessary public undertaking a success.

In order to secure the proper enumeration of all persons within the classes above indicated, there has been issued by the President of the United States the Executive Order published above. Any violation thereof will subject the offender to the penalties therein provided.

Ancon, Canal Zone, January 16, 1912.

M. H. THATCHER,
Head of Department of Civil Administration.

Approved:
GEO. W. GOETHALS,
Chairman and Chief Engineer.

CANAL ZONE TRAILS.

Contracts for Clearing Native Thoroughfares.

Award has been made to Charles Alberts of a contract for clearing trails in the Canal Zone south of Gorgona for $3,780, which is an average of about $30 an acre. The contract provides that the trails be cleared to a width of 20 feet of all brush, cane, grass, trees, or other growth, not exceeding one foot in diameter, and the material cut must be burned or cleared from the trail. Trees not under 3 inches in diameter and not over one foot must be removed to a height not exceeding one foot above the ground, and all growth of less than 3 inches in diameter must be removed to a height of not more than two inches above the ground. The trails to be cleared are the following.

Panama-Cruces trail, a distance of approximately 18 miles.

Corozal-Cruces trail from a point near Corozal to the Cruces trail, a distance of approximately 2 miles.

Pedro Miguel-Cruces trail from Pedro Miguel to a point on the Cruces trail, a distance of approximately 3 miles.

Empire-Cruces trail from Empire to a point on the Cruces trail, a distance of approximately 5 miles.

Empire-Maria Eugenia trail, through Calle Boca, a distance of approximately 5 miles.

Arraijan-Rio Grande trail from the Canal Zone boundary east of the village of Arraijan to a point on the Panama railroad 600 feet below the Rio Grande dam, a distance of about seven miles.

Arraijan-Paraiso trail from the Canal Zone boundary east of the village of Arraijan to a point on the Panama railroad north of trestle crossing the Canal, a distance of about six miles.

Arraijan-Cochinito Trail from the Canal Zone boundary south of Arraijan to Cochinito village, a distance of about six miles, following the route of the old trail through the land leased by Dr. Rafael Neira.

In the clearing, the locations which have been locally determined by previous usage by the population in their vicinity will be followed upon designation by the Superintendent of Public Works.

Mr. Alberts has also been awarded a contract for clearing the trail from Cruces to Gamboa, a distance of approximately 2 miles, for $159.00, and the trail from Mount Hope to Majagual, a distance of approximately 8 miles, for $79.50 a mile.

A revocable license has been granted to the Panama-American Corporation of the city of Panama to run a power and telephone line through the Canal Zone from the city to the residences on the Sabanas.

Material In Towing Locomotives.

The article in THE CANAL RECORD of December 27, regarding the award of a contract for the towing locomotives for the locks, was in error in that it stated—"The award was made on the regular bid, in which carbon steel was specified, the optional bid being for vanadium steel." The specifications called for bids with vanadium steel and with carbon steel, and the award was made for carbon steel because it was cheaper and satisfactory for the purpose intended.

Rainfall from January 1 to 27, 1912, Inclusive.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

GENERAL.

The schedule for moving picture entertainments for the week February 5 to 10, is as follows: Monday, Gatun; Tuesday, Gorgona; Wednesday, Cristobal; Thursday, Culebra; Friday, Corozal; Saturday, Empire.

COROZAL.

A debating society was organized at the clubhouse on Monday night, January 22. The officers are: President, Mr. Bennick; Vice-President, Mr. LeMire; Secretary, Miss Mosteller. A debate and other interesting parts of a program are being arranged for Monday night, February 5.

The handicap pool tournament was started Monday night. Twenty-two men have entered the tournament and will compete for the three prizes.

Over 300 people attended the entertainment given at the clubhouse Wednesday night, January 24. This date marked the first anniversary of the opening of the building by the Y. M. C. A. Moving pictures were shown, music was furnished by the 10th Infantry Orchestra and refreshments were served.

Two dozen new cues have been ordered for the pool and billiard room.

CULEBRA.

On February 14, a "Country School" program will be given at the clubhouse, to which all will be invited.

The following is the standing of the handicap chess tournament that started on Tuesday, January 23:

Name.	Won.	Lost.	Draw.
Bartlett	3	2	
Janney	3	2	
Newman	3	4	
Warner	2	0	
Stearns	2	1	
Dubois	2	1	1
Vogel	1	1	
Erickson	2	5	
Goodenow	1	3	
Wilson	0	0	1

The observation tower, which is being built back of the clubhouse and connected with it by a doorway, will be completed in a few days and the people along the Canal are invited to visit Culebra and get a good view of Culebra Cut and the slides.

The following are the high scores of the duck pin tournament during the week: Case, 101; Cornthwaite, 104; Hoffman, 122; Cushing, 100; Van Zandt, 102; Palmer, 110; Mengel, 100; Case, 120; Brown, 100; Wheeler, 108; Conlon, 103. The standing of the teams will appear in the next issue.

EMPIRE.

The "smoker" held on Friday, January 26, was attended by 350 men. The following program was given: Orchestral selections by the 10th Infantry Orchestra under the direction of Bandmaster Coe; vocal numbers by the Tropical Quartet—Messrs. Ross, Dickson, Kersey, Case; informal remarks by Messrs. T. L. Clear and A. B. Dickson; bass solo, Mr. Paul Case; contortions, Mr. Stapleton; balancing tricks, Mr. Tudor; magic, Messrs. Hill and Hall; dancing by Mr. Vetal; wrestling, Messrs. Greening and Luttrell. Refreshments were served.

The Culebra volley ball team defeated the Empire team on January 20 in three straight games, by the scores of 21-5; 21-1; 21-9. A return game will be played at Culebra during the coming week. This game is becoming more and more popular.

On January 27, the Empire volley ball team defeated the Gorgona team by the score of 35 to 22, twenty minute halves being played.

The Empire indoor baseball team defeated the Gorgona team on January 27 by a score of 18 to 12; referee, Mr. Hall.

The recent billiard tournament was won by J. C. Wood.

Considerable interest is being taken in inter-association pool and billiards. The Empire players are anxious to start a tournament with the other clubhouses.

GORGONA.

Sixty new library books have been received and will be placed in the library for use of members by the librarian, J. E. Carpenter.

Mr. Burnsee, checker champion of the Isthmus, will be the guest of the Gorgona Checker Club on February 10 and will play twenty-five games simultaneously.

Messrs. Booz, Hopkins and Woodworth furnished music for the Sunset Sing last Sunday. Fifty-seven were present. Next Sunday night, February 4, there will be a duet by Miss Emma Steincross and Mrs. J. B. March. Singing will start at 7 p. m. All are invited to come and participate.

The Young People's Bible Class will hold a special meeting at the Y. M. C. A. on Friday night at 7 p. m. Mr. Carl Moyer has been elected secretary and treasurer.

Outdoor track work for the Washington's Birthday meet has been started. All who wish to enter the meet will please report to Mr. Hopkins on Monday, Wednesday, and Friday at 5.10 p. m.

GATUN.

The international high school basketball game held on Friday evening, January 26, drew an audience of 175 people. The score resulted: Gatun High School, 14; Panama National Institute, 12. Fred Huber refereed the game.

There will be a "smoker" at the Gatun clubhouse on Saturday evening, February 17. Some excellent talent has already been engaged, including the Tenth Infantry Orchestra.

Mrs. Blanche Caldwell, soprano soloist of Cristobal, sang four songs at the moving picture entertainment on Thursday evening, January 25. Mrs. Caldwell by unanimous request sang two additional numbers after the entertainment.

Two new Spanish classes were organized on Wednesday evening, January 24.

A new wrestling mat cover has been purchased for the Physical Department. A wrestling match will take place at the smoker on February 17.

A "Victrola" talking machine has been added to the equipment of the clubhouse.

Thirty-two books of the latest fiction have been added to the library. Any suggestions for new books may be left at the office. An order will be sent to the States within a few days.

Charles R. Hughes, Superintendent of Gatun Dam and Spillway, has been appointed a member of the Gatun Y. M. C. A. Executive Council.

"Existing Politics" was the subject discussed on Sunday evening at the meeting of the Discussion Club.

There will be a pool and checker tournament at the Gatun clubhouse on Saturday, February 3. Empire will send two pool players and one billiard player. Mr. Burnsee, the champion checker player, will play several of the Gatun men.

The following high scores in duckpins were made during the week ending January 27: Barte, 116, 103; Severn, 112; Vierbuken, 118, 103; Green, 106; Wurster, 113, 111, 100, 100; MacNalley, 101, 103; Durand, 102, 115, 109, 106; Teall, 101, 101; Lore, 108; Huttlemeyer, 101, 102, 101, 101; Rogers, 100. A local duck pin tournament starts this week.

CRISTOBAL.

On Wednesday evening, January 24, Mr. J. H. Lloyd gave a talk on the "Progress and Development of the United States Navy for the Past 100 Years." The talk included a historical review of the growth and numerical strength and mechanical development up to the present state of efficiency. Mr. Lloyd is not an employe of the McClintic-Marshall Company, as was previously reported, but of the Commission.

Two hundred and sixty-eight people were present at the moving picture show, Saturday evening, January 27. A surprise was furnished the audience by the singing of Mrs. Blanche Caldwell, between pictures. The next in the series of moving pictures will be given on Wednesday evening, February 7. It is expected that there will be several illustrated songs at this entertainment.

On Saturday evening, January 27, a pool team visited Cristobal from the Empire clubhouse; also a contest was given in billiards, both games being won by Empire.

A subscription list is being circulated to procure medals of merit for the members of the basketball team who have passed through two seasons, winning every game. Anyone desiring to contribute to this fund will kindly leave his name with A. L. Chambers.

On Saturday, February 3, the boys of the Cristobal Association will go to Gatun to compete with the Y. M. C. A. boys at that point in basketball, indoor baseball and bowling.

On Friday evening, February 2, the Checker Club will hold a unique contest. Seven players will be selected to sit at as many tables. Seven other players will be chosen to enter in the circle and form and endless chain. Any member desiring to enter this contest may leave his name at the desk before that night.

The next session of the Debating Club will be held on Wednesday evening, January 7. The topic for discussion will be, "Resolved, that the 8 o'clock curfew law should be established in Cristobal for children under 16 years of age." All men are invited to attend and participate in the discussion.

LOST—At merry-go-round in Colon, gold bell-shaped locket, with "Nettie, 1886" engraved on back. Please return to Mrs. Nettie G. Turner, Cristobal.

FOUND—At Gatun, photograph of young woman; Boston photographer. Owner may obtain it by calling at the Commission Clubhouse.

Supplies for Canal Work.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal and Colon, during the week ending January 27:

Sixaola, January 20, from New York, with 245 bundles rails and castings, 12 packages rails and castings, for Atlantic Division.

Allianca, January 21, from New York, with 26 cases wire cloth, for Pacific Division; 50 kegs chloride potash, 62 cases incandescent lamps, 46 barrels castings, for Mechanical Division; 8 cases tickets, 5,400 pieces splice bars, 265 kegs bolts, nuts, washers, for Panama Railroad Company; 18 cases coupon books, for Examiner of Accounts; 116 packages bowling alleys, 10 cases lamp chimneys, 16 bundles asphaltum, 60 kegs rivets, 528 bales hay, 308 pieces lumber, 180 barrels coal tar, 734 bundles galvanized sheets, 322 bundles steel bars, 200 cases sapolio, 100 cases linseed oil, 90 sacks cork, 13 cases bolts and nuts, 21 cases enamelware, for stock; 80 cases drugs and sundries, for Sanitary Department; and a miscellaneous cargo, the whole consisting of 8,790 packages, weighing 500 tons.

Joseph J. Cuneo, January 22, from Philadelphia, with 11,000 cases dynamite, for stock.

Prinz Eitel Friedrich, January 21, from New York, with 10 cases water closets, for stock; 95 pieces castings for Mechanical Division.

Karen, January 22, from New Orleans, with 1,717 pieces lumber, 102 pieces piling, for stock; 1,352 pieces lumber, for Mechanical Division; 626 pieces pipe, for Pacific Division.

Almirante, January 25, from New York, with 5 cases castings, for Mechanical Division; 169 kegs rivets, for Panama Railroad Company; 11 barrels tie clips, 4,654 pieces steel ties, for Atlantic Division; 36 bales life preservers, 60 coils rope, 63 bundles wheelbarrows, 500 sacks oats, 18 pieces lumber, for stock.

Cartago, January 25, from New Orleans, with 58 pieces piling, 741 pieces lumber, 20 rolls cotton duck, 75 sacks dairy feed, 455 drums kerosene, for stock; 1,119 pieces lumber, for Mechanical Division.

Carrillo, January 27, from New York, with 3 cases valves, for Pacific Division; 6 sacks shellac, for stock; 45 cases copper bars, for Atlantic Division.

Tide Table.

The following table shows the time of high and low tides at Panama for the week ending February 7, 1912 (75th meridian time):

DATE.	Low	High	Low	High	Low
	A.M.	A.M.	A.M.	P.M.	P.M.
February 1	......	1.37	8.05	2.18	8.32
February 2	......	2.38	9.00	3.15	9.28
February 3	......	3.32	9.53	4.05	10.20
February 4	......	4.22	10.41	4.52	11.06
February 5	......	5.10	11.28	5.38	11.53
February 6	......	5.56	12.14	6.22	......
February 7	12.39	6.42	P.M. 12.57	7.06	......

The following ships arrived at, or departed from, the port of Balboa during the week ending January 27:

Arrivals—January 22, *Mexico*, from Valparaiso; January 22, *Urubamba*, from Callao; January 25, *Santa Rita*, from Port Harford; January 27, *Manavi*, from Buenaventura.

Departures—January 21, *Leelanaw*, to San Francisco; January 22, *Ucoyoli*, to Callao; January 25, *Huasco*, to Valparaiso; January 27, *Stanley Dollar*, to San Francisco; January 27, *Newport*, to San Francisco; January 27, *Urubamba*, to Callao; January 27, *Peru* (P. S. N.) to Guayaquil.

MOVEMENT OF OCEAN VESSELS.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Special Reamers for Gate Construction.

For the final riveting of lock gates, the skeletons and sheathing of which have been put in place at Gatun, the McClintic-Marshall Construction Company has installed 8 special electric reaming machines. Each machine, which weighs 6 tons, carries two spindles, mounted on a heavy cast base and driven by a 10-horse-power induction motor. That the machine may be carried over the face of the gate, it is mounted on a broad adjustable scaffold, extending the length of the gate, supported by chain-blocks from brackets affixed to the top of the gate. Some of the holes on the upstream face of a gate are enlarged to a diameter of 1-1|16 inches, and others to 15|16 of an inch, and those on the downstream face are made 15|16 of an inch.

These machines are now in use on the main gates of the upper lock at Gatun and will later be used on all of the gates in the three sets of locks. They were designed by the Foote-Burt Company of Cleveland, Ohio, especially for this work and the distinguishing features are great power, 9 speeds, from very slow for heavy drilling to very high for lighter reaming, and fixed spindles arranged to suit the uniform spacing of rivet holes in the lock gates. On test one of the machines drilled 1-1|16-inch holes through 1-inch plates in four seconds, a rate of 15 inches per minute. It is estimated that each machine is capable of doing the work of five of the usual type of portable reamer.

Removal of Cantalever Cranes.

The removal of the fourth and last of the concrete placing cranes from Pedro Miguel Lock began on January 30, when the McClintic-Marshall Company began to dismantle chamber crane No. 3, which had been at work in the east chamber, to transport it to Miraflores, where it will be erected in the east chamber of the lower lock. The last of the four mixing, or berm, cranes which had been employed at Pedro Miguel was moved in October and the company has now completed the reerection of the other chamber crane, which it began to move in December. The side and center walls proper at Pedro Miguel are practically completed and the placing of the concrete requisite for the laying of the towing tracks and to finish the details, as well as for the approach and wing walls, will be done with derricks and locomotive cranes and by the use of portable mixers. When the moving is finished there will be four berm and four chamber cranes in use at Miraflores. In a good day's work this plant will be able to mix and place about 3,500 cubic yards of concrete.

Construction of Gatun Dam.

Hydraulic filling in the east half of Gatun Dam has been completed and the dry fill for the south toe of this wing, for a thousand feet from the spillway toward the locks, has been brought to full height. The top, which is at elevation 104 feet above sealevel, will not be brought higher. The west half of the dam, where hydraulic filling continues, is now about 20 feet lower than the east half.

There remain yet to be placed on the entire dam, 2,300,000 cubic yards of dry fill. After February 15 no more spoil will be taken to Gatun from Culebra Cut, and the number of steamshovels working in borrow pits to supply spoil for the dam construction will be increased from two to six. After May 1, 1912, the number of shovels at this work will be eight, and it is estimated that the dry fill can be completed by January 1, 1913. The building of the dam was begun in August, 1907, with the placing of material for the toes, and the hydraulic filling was begun on December 24, 1909. In the east wing, 4,181,496 cubic yards of wet material were placed, 4,670,215 cubic yards of rock and earth have been placed to date, and it is estimated that 850,134 cubic yards of dry fill will be required for completion.

Bridge for Towing Tracks.

Plate girders for bridging the gap between the intake buttress of the side walls and the chain fender buttress near the upper wing walls of the locks have been received at Pedro Miguel and Miraflores. A description of the bridges and of the service required of them was given in THE CANAL RECORD of August 2, 1911. Each girder, which consists of a web plate with flanges of angles riveted back to back, is 55 feet 10 inches long, 5 feet 4½ inches deep and 17½ inches wide at base and top. Three thicknesses of metal are used, the lightest girders weighing 15,000 pounds, the intermediate 23,000 pounds, and the heaviest 28,000 pounds. In use, the intermediate girder will be placed 4 feet from the outer edge of the space to be bridged; 16 feet from it the heavy girder will be set in parallel and the light girder will be laid at a distance of 9 feet 6 inches from the central one. The bridge is to be covered with reinforced concrete and will carry the rack and return tracks for the towing locomotives. The girders will be cased on sides and bottoms with concrete, to preserve the metal from climatic corrosion and make the appearance harmonize with the rest of the concrete work.

Barges to be Towed Around South America.

It has been decided to send the tug *Reliance* and three 600-cubic yard barges from the Atlantic side around to Balboa by way of the Strait of Magellan. The tug and barges are meant to take the place of clapets 7, 8, and 10, old French equipment, which, after long service, are so badly worn that they must be retired from use. As far back as 1909 it was foreseen that the clapets would not last until the end of the work and the distribution of barges for the estimated work was scheduled accordingly. The growth of demand for sand for use other than in the Pacific Division construction has necessitated an increase of equipment. The practicable completion of the delivery of crushed rock from Porto Bello to Gatun make it feasible to transfer a part of the Atlantic equipment to the other side.

The vessels will be put in order at the Cristobal shipyards and it is the desire to start not later than the middle of the month. Assuming that they will travel at from 4½ to 5 knots an hour and make 8 or 9 stops on the way, the time required for the voyage of 10,500 knots is estimated at about 100 days. Weather conditions along the South American coast are more favorable during the several months to come than during any other time of the year. The crew will be supplied by the Pacific Division, which estimates that the cost of the voyage will be not more than $15,000. It is estimated that it would cost $20,000 each to repair the clapets and that $100,000 will be saved by the transfer.

Lumber Wharf at Balboa Completed.

The laying of concrete for the lumber wharf at Balboa, the superstructure of which was begun on December 2, 1911, was finished on February 6. In the month of January, 342 running feet, of full width of 30 feet, were laid in 26 working days. This was at the rate of a panel, 30 feet long, with beams and flooring, containing 102.4 cubic yards of concrete; in 2.36 days. All of the concrete for a panel was placed on the same day, in order to insure the proper "set," and after the concrete had hardened the forms were taken down and reerected on the next caissons for the adjoining panel. From 10 to 12 Americans and between 125 and 150 silver employes made up the daily force on the superstructure, under the direction of Mr. W. J. Spalding.

The approach to the wharf from the sea is blocked by the trestle and embankment for the railway track to the sand wharf. A new track to the latter is being laid from the west, switching in from the Panama railroad at a point close to the shipways repair shops, and

NOTES OF PROGRESS.

(Continued.)

passing under a corner of the shed and close by the resident engineer's offices to the sand wharf. When the new track is put in service the present one will be removed and dredges will complete the channel excavation to the lumber wharf.

Bascule Bridge at Monte Lirio.

A bascule, or balanced lift, span will be placed in the steel girder bridge on which the relocated line of the Panama railroad crosses the Gatun River, one half mile north of Monte Lirio. This will give access to the upper arm of Gatun Lake which otherwise would be closed to vessels from the Canal. Bids have been requested for the lifting trusses, mechanism, electrical equipment, signals and other parts for the complete construction and operation under trial of this single track, single leaf bascule, which will be erected by the Commission, under direction of the contractor, upon the 103½-foot steel girders now on hand at the crossing of the river. This bridge will be about 318 feet long, composed of three half-through plate girder spans supported upon reinforced concrete piers. The channel piers, which the bascule will span, are 106.23 feet apart, center to center, and between them the channel is excavated to provide for 45 foot depth of water. The bascule will be operated by electricity.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 78 per cent completed, 176,905 cubic yards, out of a total of 225,000, having been placed at the close of work on February 3. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked	No. Mixers.
January 29	504	16.00	2
January 30	320	16.00	2
January 31	434	16.00	2
February 1	428	16.00	2

Total	36.00	13,787

Sight Seeing Train for Canal Tourists.

On Monday, February 5, the Panama railroad began a sightseeing excursion service over the Canal work. A train consisting of one first class passenger coach and the observation car now runs over the Central and Pacific Divisions on Saturday, Sunday, Monday, Wednesday, and Thursday, leaving Pedro Miguel station, and over the lock and dam work at Gatun, leaving Gatun station, on Tuesday and Friday,

Charge for each Division $1.00 gold. Regular transportation is required to point of beginning of observation trip, and return from point of ending it to home station.

New Railroad Train Schedule.

A schedule of the running time of passenger trains over the Panama railroad, effective February 15, is published elsewhere in this issue of THE CANAL RECORD.

CONCRETE WORK IN THE LOCKS.

Over 77 per cent of the concrete for the locks is in place, the amount at the close of work on February 3, being 3,262,738 cubic yards, out of a total of approximately 4,199,400. A total of 26,079 cubic yards of concrete was laid in the locks during the week ending February 3

GATUN LOCKS.

Over 89 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on February 3 being 1,805,833 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending February 3, and of the total, follows; and a similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone	Total.

Grand total	....	....	......	....	....	......	....	1,803,235

The 332½ yards shown for the portable mixers are reinforced concrete, and were placed on the following days: January 29, 66; January 30, 70½; January 31, 73½; February 1, 48; February 2, 36½; February 3, 38.

PEDRO MIGUEL LOCK.

Concrete work in the lock at Pedro Miguel is over 96 per cent completed, 807,670 cubic yards, out of a total of 837,400, bucket measurement, having been placed at the close of work on February 3. The record for each of the six 8-hour working days of last week, follows:

DATE.	AUXILIARY PLANT.						Large stone.	Total.
	2-cubic yard mixers.			½-cubic yard mixers.

HIGHWAY OVER CRUCES TRAIL

Proposed Macadam Road Will Follow Old Trade Route.

It is proposed to construct a macadamized road over the old Cruces trail, from a point where it joins the highway between Corozal and Panama, to Cruces, on the Chagres River, a distance of approximately 18 miles. Specifications are being prepared in order that bids for the work may be asked. The old trail has recently been cleared and one may now ride over it, following practically the same route that was taken by pack trains between the old city of Panama and the transfer station to water carry on the Chagres, at the point called Cruces. This is probably one of the oldest highways in America still in use. The Rio Grande and Chagres River were explored by the Spaniards in 1527, the journey down the Chagres from a point near Cruces occupying from April 3 to April 10 of that year. The river route across the Isthmus, with portage from Cruces, the head of navigation, to Panama, was probably used as early as 1530, and it was in common use as early as 1537.

The trail was paved with field rock, but no bridges were built. Its abandonment as a highway of international trade occurred about the middle of the eighteenth century when the treasure and merchandise fleets ceased to call at Porto Bello (1738). The trail experienced a revival of treasure hunting trade in 1849-1853 when it was used as part of the Panama route to California, but it was almost completely abandoned upon the opening of traffic of the Panama railroad.

The proposed opening of the Cruces trail is part of the general program of road building, under which there have been constructed 40.53 miles from Canal Zone funds, and 46.83 miles on account of the Canal work.

Civil Service Examinations.

A supply of the Manual of Examinations for the spring of 1912 has been received in this office.

The following examinations will be held beginning probably about the third Sunday in March and applications therefor will be received until February 28: assistant, Philippine Service; assistant inspector, and local inspector of boilers; assistant inspector, and local inspector, of hulls; bookkeeper, Philippine Service; civil engineer, Philippine Service; civil engineer student, Departmental Service; copyist topographic draftsman, topographic draftsman, Departmental Service; junior engineer draftsman, Engineer Department at Large; forest assistant, Forest Service; forest assistant, Philippine Service; industrial teacher, Philippine Service; junior engineer (mechanical), junior engineer (mining) Bureau of Mines; kindergarten teacher, Indian Service; matron, Indian Service; physician, Indian, Isthmian Canal, Philippine, and Public Health and Marine-Hospital Services, and Coast and Geodetic Survey; postal clerk, Isthmian Canal Service; teacher, Philippine Service; veterinarian, Philippine Service; and veterinary inspector, Departmental Service. Women will be admitted to the copyist topographic and topographic draftsman examinations, and may be admitted to the teacher, Philippine Service, examination; women only will be admitted to the kindergarten teacher and matron, Indian Service, examinations.

The following examinations will be held beginning probably about the second Sunday in April and applications therefor will be received until March 25: agricultural inspector, Philippine Service; cadet engineer, cadet officer, Lighthouse Service; civil engineer, civil engineer and draftsman, Departmental Service; mechanical draftsman, topographic draftsman, Isthmian Canal Service; engineer, Indian Service; farmer, Indian Service; fish culturist, Departmental Service; junior engineer (civil), junior engineer (mechanical or electrical), Engineer Department at Large, pharmacist, Public Health and Marine-Hospital Service; surveyor, Philippine Service; teacher, Indian Service; and trained nurse, Indian, Isthmian Canal, and Philippine Services. Women will be admitted to the teacher, Indian Service, examination. and women only will be admitted to the trained nurse, Philippine Service, examination.

In requesting application blanks for any of the above-named examinations the exact title thereof as given above should be stated. In filing applications the date of examination should be *omitted.* In answering questions in regard to bona fide residence, such residence must be shown in a State or Territory of the United States, and county thereof, *up to the time of filing application.*

It is to be noted that the examination for clerk, Isthmian Canal Service, will *not* be given during the spring of 1912. No inquiry in regard thereto should therefore be made before August 1, 1912.

Ample advance notice will be given of the dates of the next typewriter and stenographer and typewriter examinations.

JOHN K. BAXTER,
Secretary, Isthmian Civil Service Board.
Culebra, C. Z., February 5, 1912.

Canal Service Medals.

The following service medals are being held by the Washington Office, on account of inability to locate such employes as are living, or the relatives of those deceased. This list is being published in the hope that the publicity may call attention of interested parties to the matter, and proper addresses be secured:

Medal No.	Name.
	1907–1909.
2,360	Abercrombie, John
3,361	Brownawell, George W.
2,630	Cummings, William
2,321	Fey, Walter
3,416	Fitzgerald, James G.
3,581	Fitch, F. W.
3,119	Heisey, Charles E.
2,559	Lawver, Jacob I.
2,270	Pritchard, L.
2,754	Sharpe, William D.
2,901	Shelato, Sam
3,256	Woodgard, Claude C.
2,833	Wright, Wallace R.
*2,614	Lindsay, Robert E.
	1908–1910.
3,993	Adams, Leon
3,966	Bird, James V. .
3,809	Barron, Frank A.
4,405	Beyers, Robert
4,393	Blumer, G. H.
4,149	Corbett, Malachy J.
4,306	Coyle, Francis B.
3,650	Ellsworth, Cornelia H.
4,173	Garvey, Joseph T.
3,953	Hamilton, Ralph A.
3,913	Hackett, Michael W.
4,229	Johnson, James S.
3,706	Johnson, Joseph
4,531	Jones, Frank A.
3,899	Kelley, Daniel E.
4,204	Kane, George H.
4,138	Linne, George A.
3,868	MacDonald, John G.
4,115	Mahoney, Pat S.
4,188	Monroe, Peter J.
4,356	Nolan, William
3,832	Nelson, Edward
4,280	Randall, Charles B.
3,871	Sutcliffe, John W.
4,396	Windsor, Richard S., Jr.
4,248	Zeier, Andrew
*4,563	Day, Henry G.

*Deceased.

CONTROL OF LOCK MACHINERY

Gates Will Open, Valves Operate, and Water Rise and Fall At Will of One Operator.

The gates, valves, and fender chains of the locks will be operated by electricity, and remotely controlled from a central point; that is, there will be a central control station for each of the series of locks at Gatun, Pedro Miguel, and Miraflores. In passing a ship through the locks it will be necessary to open and close miter gates weighing from 300 to 600 tons, fill and empty lock chambers containing from three and one half to five million cubic feet of water, raise and lower fender chains weighing 24,098 pounds each, and to tow the vessel through the locks. All these operations, except that of towing, will be controlled by one man at a switchboard. The towing will be done by electric locomotives running along the lock walls, in the manner described in THE CANAL RECORD of September 27, 1911. Specifications for the control apparatus have been sent to the Washington office, and bids will be requested a few weeks hence.

The control system for Gatun Locks is typical. Water is let into the lock chambers or withdrawn from them by means of culverts under the lock floor, which connect with larger culverts in the lock walls, through which water is carried from the higher to the lower levels. The main supply culverts are 18 feet in diameter, and the flow of water through them is controled by rising-stem gate valves, which can be completely opened or closed in one minute. In the center wall the culvert feeds both lock chambers, and therefore at each outlet into the lateral culverts there is a valve of the cylindrical type, in order that water may be let into or withdrawn from either chamber at will. A complete opening or closing of these cylindrical valves takes ten seconds. The miter gates are never opened or closed with a head of water on either side of them, the chambers being first emptied or filled by means of the valve and culvert system. The time required either to open or close the miter gate is two minutes.

A ship to be raised to the lake level will come to a full stop in the forebay of the lower lock, prepared to be towed through one of the duplicate locks by electric towing locomotives. The water in the lower lock chamber will be equalized with the sealevel channel, after which the miter gates will be opened, the fender chain lowered and the vessel passed into the first chamber, where the water is at sealevel. Then the miter gates will be closed. The rising stem gate valves at the outlet of the main culverts will be closed, while those above will be opened, allowing water to flow from an upper level into the lower chamber, which, when filled, will raise the vessel 28⅓ feet, to the second level. This operation will be repeated in the middle and upper locks until the ship has been raised to the full height of 85 feet above the level of the sea. At Gatun in the passing of a large ship through the locks, it will be necessary to lower four fender chains, operate six pairs of miter gates and force them to miter, open and close eight pairs of rising-stem gate valves for the main supply culverts, and thirty cylindrical valves. In all, no less than 98 motors will be set in motion twice during each lockage of a single ship, and this number may be increased to 143, dependent upon the previous condition of the gates, valves and other devices.

Each gate leaf, valve and fender chain is operated by a separate motor mounted near the machinery in chambers in the lock wall, the motors acting through suitable gears (or pump in the fender chain) upon the various machines. In each machinery chamber will be erected a starting panel containing contactors by which current will be applied to the motor and these panels will in turn be controlled from a main unit in the central control house. Some of the machinery chambers at Gatun will be 2,700 feet distant from the point of control; 90 per cent of them will be within 2,000 feet, and 50 per cent of the total within 1,200 feet.

Contactors—All contactors will be operated directly from the central control house without the intervention of relays, and without resistance in the control circuit. Small and medium-sized motors will be started and reversed by throwing directly on the line which will normally be at 220 volts and 25 cycles. The larger motors, above 25 horse-power, will have in addition one starting point in each direction with resistance in the primary. All motors are of the squirrel-cage type, except the locomotive traction motors which are of the slip-ring type. Starting resistance is specified in preference to compensators in order to obtain the simplest possible arrangement with a minimum number of contactors, and to obtain an unlimited range of adjustment in the starting resistance. Reversing will be done by double pole contactors, mechanically interlocked, and, in order to have all contactors on a panel alike, when a starting resistance is used, the resistance will be in two legs only of the three-phase circuit, and short-circuited by means of a double-pole contactor. Single-phase alternating current at 220 volts and 25 cycles will be supplied for the operating circuit of all contactors. Contactors will be designed for normal operation at this voltage, but shall continue to operate successfully if the voltage at the contactor coil terminals falls as low as 70 per cent of normal.

The motor for the rising-stem gate valve machine will have a rating of about 50 horse-power, miter gate moving and guard valve motors, 35 horse-power; cylindrical valves and other motors, 7½ horse-power; the chain fender pump motor will probably be rated at about 25 horse-power. In all there will be a total of 951 motors of all sizes and descriptions at all the locks, this total including 207 motors required to drive various pumps and pumping machinery.

Control House—The station from which control will be exercised over the movement of all the machines will be on the center wall at the lower end of the upper flight of locks at Gatun, and similarly placed at Pedro Miguel and Miraflores. It will be in a building raised high enough above the top of the wall to allow a towing locomotive to pass under, a height of 16 feet, and to command an uninterrupted view of every part of the locks. In this house will be a double control board duplicated to conform to the duplication in locks. The control board will be in the nature of a bench or table, 32 inches above the floor, containing a representation, part model and part diagrammatic, of the flight of locks controlled by the respective series of switches. Standing at his switchboard the operator will throw the switches, and before him will see in model or diagram the progress of the fender chains as they rise and fall, the movement of the miter gates inch by inch, the opening and closing of the gate valves in the main culverts at every stage, the operation of the cylindrical valves, and, in addition, indication of the gradual rise or fall of the water in the lock chambers. The switches controlling the various motors, together with their indicators, will be mounted upon the board in the same relative position as the machines themselves in the lock walls. Some distortion of scale will be allowed, to give room for the switches. The board must not be over four feet in width, in order that the operator may be able to reach beyond the middle of it, and the length of the board is limited to 30 feet at Gatun, and proportionally at the other locks.

Interlocks—The system will be interlocking, so that certain motors cannot be started in a certain direction until other motors are operated in a proper manner to obtain consistent operation on the whole, and to avoid any undesirable or dangerous combinations in the positions of valves, gates, or fender chains. In this way and by the use of limit switches the factor of the personal equation in operating the machines is reduced to a minimum, almost mechanical accuracy being obtained. Before the operating pair of valves in the main culverts can be opened at least one pair of valves at the other ends of the locks, both upstream and downstream, must first be closed. This limits an operator to the act of equalizing water levels between locks, and keeps him from allowing water to flow from, say the lake level to the middle lock past the upper lock, thus preventing a possible flooding of the lock walls and machinery rooms. Interlocks, devoted to the control of action between the gate valves in the main culverts and the miter gates, prevent valves being opened a lock length above or below a miter gate which is being opened or closed, and thus prevent an operator causing a flow of water while the miter gates are being moved. Interlocks for the cylindrical valves guarding the openings from the center wall culvert to the lateral culverts will keep those of one side or the other closed at all times, except when it may be desired to cross-fill the chambers, when they may be opened by special procedure. An interlock prvents the operator from starting to open a miter gate before unlocking the miter forcing machine. The miter gates guarded by a fender chain must be opened before the chain can be lowered, and the chain must be raised again before the gate can be closed, or more exactly the switches must be thrown in this order, but the operations may proceed at the same time. The simple interlocks will prevent such a mistake as leaving the chain down through lapse of memory when it should be up to protect the gate.

Special Switches for Miter Gates—A commutating switch is used in connection with the miter gate moving machinery, and serves two functions. First, when the miter gates come to the closed position, and not until then, it completes a circuit from the control house, by means of which the miter forcing machine may be closed, for forcing and holding the gates in proper miter. In this way there is given an interlock by virtue of which the operator in the control station cannot close the miter forcing machine too soon. The other function is to alter the circuits controlling the rising and falling of the handrail of the foot walk over the gates, so that should the handrails be up when the gates start to open they will be automatically lowered. The circuits for raising the handrails are disconnected so that they cannot be raised as long as the gates are open. If the handrails were allowed to be up when the gates are opened back into the recesses of the lock wall they would interfere with a passing towing locomotive.

An auxiliary cut-out switch is provided for the miter gate strut. The gates are opened and closed by means of a strut or connecting rod acting between the gate and crank pin on a large driving gear, as described in THE CANAL RECORD of April 26, 1911. The relation of parts is such that a toggle effect is produced near the ends of travel, and the motor would be capable of doing damage to some of the parts should the gate meet with an obstruction. One end of the strut is allowed a telescoping movement of a few inches against the action of a nest of stiff springs. These springs oppose equally a lengthening or shortening of the strut and hold the telescoping parts against stops with sufficient initial tension so that with ordinary water resistance to the gate in normal operation there will be no change in length of the strut. Should the gate meet a solid obstruction near one end of travel, where the motor is capable of producing overload on the mechanical parts, the strut is compressed or extended according to direction of forces. The cut-out switch is mounted upon one end of the telescoping members, while a rod entering the switch casing is attached to the other. The movement of this rod in and out of the casing operates the switch to open the control circuit and stop the motor. It is necessarily arranged so that if the switch is operated by compression of the strut, that side of the control circuit is opened which produces a rotation of motor corresponding to compression, and the other circuit remains unbroken for reversing and drawing the gate away from the obstruction. If operated by tension and the motor is stopped, it is possible to reverse and apply compression to the strut.

Limit Switches; Indicator Switches—Limit switches for opening the control circuit when a machine has reached the proper point in its travel will be attached to all machines. It will be necessary for the operator in the control house to follow up the progressive movements of some machines, such as rising-stem gate valves and miter gates. These will accordingly be provided with synchronous indicating devices which will show by means of instruments on the control switchboard the movement and position of the machines at all times. In the case of certain other machines, like cylindrical valves and miter forcing machines, it is necessary for the operator to know only when the movement is completed. For this purpose there will be attached to the limit switch an indicator switch, which will indicate, by lighting lamps or otherwise, that a machine has reached the end of its travel.

In the masonry walls float wells are provided and connected to all lock chambers. At these wells suitable apparatus will be installed for operating instruments on the control board, which instruments will show at all times the water levels in the various locks and approaches.

The specifications call for materials in four classes as follows:

Class 1, Starting Panels—One hundred and sixteen for rising-stem gate valve motors, one starting and one running point both forward and reverse. One hundred and ten starting panels having one starting and one running point both forward and reverse for use with motors on 92 miter gate moving machines, and 18 guard valves. Two hundred and eighty starting panels with one point forward and one point reverse for use with motors on 120 cylindrical valves, 12 auxiliary culvert valves, 46 miter forcing machines, 80 miter gate handrails, 22 spillway gates.

Class 2, Limit Switches, Commutating Switches, Overload Cut-Out Switches, Indicator Switches, Hand-Rail Control Switches—One hundred and ten limit switches for use with 92 miter gate moving motors, and with 18 guard valves. Twenty-two limit switches for having indicator switch attached, for spillway gates. Fifty-eight switches arranged for having indicator switch attached for use with 46 miter forcing machines, and 12 auxiliary culvert valves. Eighty limit switches for use with handrail motors on mitering lock gates. Forty-six commutating switches for use with right hand miter gate moving machines. Forty-six commutating switches for use with left hand miter gate moving machines. Forty-six auxiliary cut-out switches for miter gate strut, right hand. Forty-six auxiliary cut-out switches for miter gate strut, left hand. Two hundred indicator switches for attachment to limit switches on 120 cylindrical valve machines, 46 miter forcing machines, 12 auxiliary culvert valve machines, 22 spillway gate machines. Eighty hand-rail controllers, foot operated.

Class 3. Miscellaneous Remote Indicators—Two hundred red and green lamp indicators for mounting on control board to be operated by switches. Ninety-two indicators giving progressive or synchronous indication for miter gate moving machines. One hundred and sixteen indicators giving progressive or synchronous indications for rising stem gate valves. Eighteen indicators giving progressive or synchronous indication for guard valves. Forty-six float well indicators, including float and machinery at well and indicator for mounting on switchboard.

Class 4, Control Switchboards—One control switchboard with control switches and interlocks for the locks at Gatun, Pedro Miguel, and Miraflores, one each. Control switchboards for the spillways of Gatun and Miraflores dams, one each.

Class 5, Fender Chain Control Apparatus—Two starting panels for 50 horse-power pump motor operating fender chains. Two operating valve control equipments. Two limit switches. Two indicating devices for showing position of chain to those in vicinity of the chain itself. Forty-six starting panels for 50 horse-power pump motor operating fender chains. Forty-six operating valve control equipments. Forty-six limit switches. Forty-six indicating devices for showing on control switchboard at all times the position of chain. Forty-six indicating devices for showing position of chain to those in the vicinity of the chain itself.

Pacific Division Sand Service.

A statement of sand supplied by the Pacific Division sand service during January follows:

	Cu. Yds.
Pacific Division	34,813
Atlantic Division	11,662
Central Division	255
Mechanical Division	400
Quartermaster's Department	50
Lighthouse work	184
Panama Railroad	1,708
Concrete Dock (Pacific entrance)	990
Miscellaneous	200
Total	50,262

SOCIAL LIFE OF THE ZONE.

Women's Clubs.

There will be a meeting of the Executive Board of the Canal Zone Federation of Women's Clubs at Gorgona on Friday, February 9, at 2.30 p. m. The officers of the Federation and the presidents of the clubs constitute this board and all are urgently requested to attend. The clubs are requested to keep a list of the Federation officers on file in order that should it be necessary to communicate with the Federation no delay may be occasioned. This list was published in the issue of THE CANAL RECORD of January 31.

The general meeting of the Cristobal Woman's Club will be on Wednesday, February 7. Mr. Harry Sawtelle is to be the speaker.

The Gatun Woman's Club has arrangements under way for an entertainment to be given for the benefit of the Federation blind boy fund. Entertainments for the same object are also to be given by the Empire Woman's Club; the first is to be a sale held in the band stand on Saturday, February 10. Fancy articles, cakes, candies and other home made delicacies will be sold. The sale will begin at 5 o'clock and will continue into the early evening. The club will hold a second sale at Las Cascadas the last week in February. Arrangements for this sale are to be made at the next meeting of the club. The club met on Wednesday, January 31 at the home of Mrs. Charles E. Lingo.

There was a general meeting of the Paraiso Woman's Club on Wednesday, February 7,

The Gatun Sunshine Society will hold a tea and baby show in the chapel on Wednesday, February 14, the object being to raise money for the Gatun Room in the Arthur Home at Summit, New Jersey. The society has received a photograph of the room, with a cordial letter of appreciation for the contributions of the past year. One of the ways of raising funds that has been instituted by the society is the "sunshine sewing," each member of the society offering her assistance in sewing for twenty-five cents an hour. By this means a considerable sum of money was added to the fund last year.

Church Notes.

There will be a meeting of the Woman's Guild of St. Ferdinand's Church, Empire, on Tuesday, February 13, when there will be an election of officers for the ensuing term.

The meeting of the Woman's Guild of St. Luke's Church, Ancon was held at the Hotel Tivoli on Tuesday, February 6, at 9.30 a. m.; the second meeting for the month will be held at the home of Mrs. Charles F. Mason on Tuesday, February 20, at 3.30 p. m.

Boy Scouts.

The visit to the Isthmus on January 10 of Lieut.-Gen. Sir Robert Baden-Powell of the British Army, retired, founder of the Boy Scout movement in England, has caused a revival of interest among the boy scouts in the Canal Zone. The scout masters are holding weekly meetings for the special purpose of encouraging the study of the scout manual. It is expected that a general February outing will be held at Porto Bello on the 24th. There are now about 75 boy scouts in the Canal Zone. Colonel Roosevelt, for two years honorary vice-president of the Boy Scouts of America, has become the Chief Scout Citizen, and has assumed the direction of those activities in the scout movement that pertain to the training of the boys in citizenship and social service. Ernest Seton Thompson has charge of the activities pertaining to woodcraft, and Gifford Pinchot is at the head of those activities pertaining to the development of trees and other natural resources of the country.

Membership in Society of The Chagres.

The Society of The Chagres solicits applications for membership from those who are eligible under the following article of its Constitution:

ARTICLE 3. Membership in the Society shall be limited to white employes of the Isthmian Canal Commission or of the Panama Railroad Company of good character, who have earned the Roosevelt Canal Medal and two bars prior to the official opening of the Canal.

The initiation fee, which covers the cost of the Society's emblem, is $3.00 and the annual dues are $3.00 payable in advance. Copies of the Constitution can be obtained from the undersigned, who is also authorized to receive applications for membership.

JOHN K. BAXTER,
Secretary-Treasurer.

Culebra, C. Z., February 6, 1912.

Tennis Tournament.

The following was the result of the lawn tennis tournament in singles held on the court of the Gatun Tennis Club on Sunday, January 28: Preliminary—R. W. Hart, Cristobal, defeated Wells, Gatun, 6–2, 7–5; Dr. Ross, Ancon, defeated Tupper, Culebra, 6–3, 7–5; Newbold, Empire, defeated Stokes, Bas Obispo, 6–4, 6–3; Fechtig, Tivoli, won by default from Panama, not represented. Semifinals—Hart, Cristobal, defeated Dr. Ross, Ancon, 8–6, 10–8; Fechtig, Tivoli, defeated Newbold, Empire, 6–4, 6–2. Finals—Fechtig, Tivoli, defeated Hart, Cristobal, 6–3, 4–6, 6–2.

PERSONAL.

Lieut.-Col. John L. Phillips, with Mrs. Phillips, returned from the States on the *Advance* which arrived on Saturday, February 3.

Pilots, Mates, Masters, Engineers, Chauffeurs.

Examinations for pilots, mates, masters and engineers; and for chauffeurs, will be held by the Board of Local Inspectors at the Administration Building, Ancon, on February 14, 1912. All applicants for licenses as chauffeur must secure from the Department of Civil Administration, Executive Office, Ancon forms of application, and information respecting the filling out of the same, not later than the day previous to the examination. All applicants for examination must be present at the Administration Building at 8.00 a. m., on February 14, with papers in proper form. In addition, applicants for chauffeurs' licenses must demonstrate their capacity properly to operate an automobile, and must have the automobile with them.

LOST—In Cristobal, ribbon watch fob, having gold locket engraved with letter "D" attached. Reward if returned to I. N. DeLong, Box 45, Cristobal

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

GENERAL.

The schedule for moving picture entertainments for the week February 12 to 17 is as follows: Monday, Gorgona; Tuesday, Cristobal; Wednesday, Gatun: Thursday, Empire; Friday, Culebra; Saturday, Corozal.

The Eberly Concert Company, consisting of John Eberly, baritone, Miss Alice Carey, violinist, Miss Elizabeth Weedman, soprano, and Miss Mary E. Lyon, reader, will arrive on the Isthmus on February 15 and will give a series of concerts in the various clubhouses. Mr. Eberly has sung in the principal cities of the United States and Canada. He was for some time featured on the Keith International Circuit. The other members of his company are entertainers of experience. The following dates have already been arranged, and it is likely that additional engagements will be made after the arrival of the company: Cristobal, February 16; Empire, February 17; Culebra, February 19; Gorgona, February 22; Corozal, February 23; Porto Bello, February 24; Empire, February 25; Gatun, February 26. Admission—Members free, others 50 cents, children 25 cents.

CULEBRA.

The following is the standing of the Chess Club:]

Name.	Won.	Lost.	Draw.
Bartlett	6	4	
DuBois	3	3	1
Goodenow	5	3	
Erickson	3	6	
Janney	6	3	
Newman	3	9	
Stearns	3	2	
Warner	2	1	
Wilson	0	0	1

A country school entertainment will be held on February 14, to which every one in Culebra is invited.

A Spanish class will begin as soon as arrangements with an instructor can be made.

The following is the standing in the Duck Pin Tournament:

Number of Team.	Standing.
Team Number 5	1
Team Number 4	2
Team Number 2	3
Team Number 6	4
Team Number 1	5
Team Number 8	6
Team Number 3	7
Team Number 7	8

The following are the high scores: Mengel, 102; Case, 110; Brown, 103.

The moving picture entertainment will be given on Saturday night of this week instead of Thursday night as previously published.

EMPIRE.

The following high scores were bowled on the alleys during the past week: Duck-pins—Gorham, 105, 126, 104, 104; Rodeighiro, 113, 107; Gustaveson, 101, 112, 105; Pinney, 100, 109, 110; Grund, 103; Parkis, 121; L. Giavolli, 110. Candle pins—Parkis, 105; Goolsby, 113, 107; Rodeighiro, 113.

The following are the five high average men in the local bowling tournament:

Name.	Games.	Average.
Rodeighiro	108	92.19
Gustaveson	39	90.74
Gorham	48	89.89
Grund	57	89.63
Pinney	81	89.59

On Thursday, February 1, Empire defeated Culebra in pool and billards by the following scores: Pool—Empire, Hursh, 125, McCoullough, 125; Culebra, Vogal, 54, Hillery 38. Billards—Empire, Wood and Smith 150; Culebra, Conlin and DuBois 121.

On Thursday, February 8 the Empire pool and billard players will go to Culebra for a return match.

The Cristobal pool and billard players will play at Empire on Saturday, February 10.

The following men have been named as a committee to assist with the gymnasium and athletic work: Messrs. Garrett, King, and Doran. Regular gymnasium classes will be started this week.

GATUN.

"Open house" was observed at the clubhouse on Saturday evening, February 3. The features of the evening were the pool, billiard, and checker matches. The results of the pool games are as follows: DePoorter (Gatun) 125, Hush (Empire) 104; Dalton (Gatun) 125, McCollough (Empire) 101; Hughes (Gatun) 100, McKeever (Empire) 71. In the billiard game Smith (Empire) defeated DePoorter (Gatun) 50 to 42. The checker match resulted : Mr. Burnsee champion checker player of the Isthmus, playing 21 men simultaneously won 37 out of 48 games. Eight games were draws. The men who won one game each were Barte, Chatfield, and Jefferies. Refreshments were served. About 200 men were present.

Mr. Weston of Cristobal was the soloist at the moving picture entertainment on Tuesday evening, January 30. Two hundred and seventy people attended.

A good program has been arranged for the vaudeville smoker to be held on Saturday evening, February 17.

The two Spanish classes for women were so successful for the first course of ten lessons that a second course will be started this week. Prof. Gomez will have charge.

Gatun clubhouse has invited the other clubhouses to participate in an athletic meet at Gatun on Saturday evening, February 10.

George A. Barte led the meeting of the Discussion Club on Sunday evening, February 10. The subject was "The Recall of Judges."

The high score in duck pins for the week ending February 3, was made by Huttlemeir, 113. Those making 100 or over for the week ending February 3 were: Dalton, 110; Severn, 101, 101; Vierbuchen, 100 Wurster, 108, 117; Teall, 103, 101; Lore, 106; Huttlemeir, 113, 112, 101; Rogers, 100, 101; Claherty, 100; Gayer, 101; Kerruish, 103.

The results of the match games between Cristobal boys department and Gatun boys department held at Gatun were all favorable to Cristobal. The games were bowling, basket ball, and indoor baseball. Physical Directors Burrell and Dwelle were in charge.

The February duck pin tournament has started. The man having the greatest pinfall for any ten games will be the winner of the tournament.

The members of the beginners class in Spanish are Dillon, Smith, Shuck, Scoffern, Storey and Fitzpatrick. Those who compose the advanced class are Waid, Gayer, Jervey, Johnson, Duckworth, Storey, Huber, Jecko, Chatfield, Hanson, R. and Hanson, J. A.

CRISTOBAL.

The debate held on Wednesday evening, December 31, subject, "Resolved that the Country Boy has More Advantages for Advancement than the City Boy," was decided in favor of the affirmative. The next public meeting of the Debating Club will be held on Monday evening, February 12. It will be in the nature of a Lincoln celebration. It is expected that an orchestra will be secured, and other musical specialties are being arranged for. The famous Gettysburg Speech will be read by the Rev. C. H. Elliott. The address of the evening, subject "Abraham Lincoln" will be delivered by C. J. Dinnin, President of the Club. The adult public is invited. Admission will be free and refreshments will be served at the close of the program.

Regular gymnasium classes for the boys will meet on Tuesday and Thursday afternoons at 3.15.

Afternoons for ladies to bowl are on Wednesdays and Fridays, 2.00 to 5.00 o'clock.

High scores in duck pins were as follows: Barte, 116, 105, 101; Barrett, 109, 105, 103; Herrington, 103, 102; Gibson, 109, 101; E. Orr, 102; Weston, 110; Hess, 102; Louch, 104. Bigpins—Gibson, 207; Beattie, 202.

Band Concerts.

A concert will be given by the Isthmian Canal Commission Band at the Hotel Tivoli, Ancon, C. Z., Sunday, February 11, 1912, at 7.30 p. m. The program follows:

Central Division Unloaders.

Lidgerwood cars were unloaded on the Central Division dumps during the month of January as follows:

LOCATION.	No. of unloaders.	No. of trains.	No. of cars.
Balboa	4	1,179	23,580
Miraflores	3	715	14,280
Gamboa	4	1,198	25,156
Total	11	3,092	63,016

OFFICIAL CIRCULARS.

Acting Chairman and Chief Engineer.

CULEBRA, C. Z., January 27, 1912.

CIRCULAR No. 430 (Corrected):

During my absence from the Isthmus, Col. H. F. Hodges will be in charge of the work as Acting Chairman and Chief Engineer, effective January 29, 1912.

GEO. W. GOETHALS,
Chairman and Chief Engineer.

Steel Castings and Patterns.

CULEBRA, C. Z., February 1, 1912.

HEADS OF DEPARTMENTS AND DIVISIONS:

A plant for making steel castings has been installed and put in operation in the Gorgona Shops and it is desired that orders be placed at once on the Mechanical Division for any steel castings that will be required in the near future and which should be made on the Isthmus, in order that advantage may be taken of the presence of the metallurgical engineer in training the permanent foundry force in the making of steel castings.

A considerable number of parts of equipment has been made in the past of cast iron that should have been made of steel, because of the length of time required to obtain steel castings from the United States; in ordering castings made on the Isthmus in the future the relative economy of steel and iron should be considered and the order given accordingly.

A large part of the total time required to make a steel casting is consumed in the making of the pattern. It is therefore suggested that patterns be ordered made and stored of essential parts of equipment made of steel castings of which the probability of the parts being required in the future is sufficiently great to justify such action but the probability of the parts being required is not sufficiently great to warrant the keeping of them in stock.

H. F. HODGES,
Acting Chairman, Isthmian Canal Commission.
Second Vice-President, Panama Railroad Company.

Official Business Trip Tickets.

CULEBRA, C. Z., February 1, 1912.

CIRCULAR No. 224-A:

A new supply of I. C. C. Official Business Trip Tickets has been received. The new ticket differs slightly from the form now in use in that the points between which transportation is desired appear on both the going and return portions of the ticket. Provision has also been made for both first and second-class transportation, and new colors have been adopted. The new tickets will be honored by collectors on and after February 6, 1912.

In order to avoid the necessity of calling in a large number of outstanding countersigned tickets it has been decided to continue the use of the present form, in connection with the new ticket, up to and including February 29, 1912, after which date the new ticket must be used exclusively, and all outstanding tickets of the form now in use should be returned to this office for cancellation.

Requisitions should be made on this office at once for a supply of the new form, indicating your requirements as regards both first and second-class tickets.

H. F. HODGES,
Acting Chairman and Chief Engineer.

Ratings and Rates of Pay.

CULEBRA C. Z., February 2, 1912.

CIRCULAR No. 229-v:

Europeans now employed in wrecking crews as Wreckers at the rate of $62.50 a month will be retained at that rate until they leave the service or are discharged.

In employing Europeans to fill future vacancies as Wreckers, for service in the wrecking crews, the maximum rate of pay of $50.00 a month is hereby established

The maximum rate of pay of $42.50 a month for West Indians, employed as Wreckers in the wrecking crews, remains unchanged.

H. F. HODGES,
Acting Chairman and Chief Engineer.

Dynamite Not to Remain in Cars.

CULEBRA, C. Z., February 2, 1912.

CIRCULAR No. 431:

Consignees of explosives will not allow same to remain in cars over twenty-four hours after receipt of cars.

H. F. HODGES,
Acting Chairman and Chief Engineer.

Gatun-Culebra Labor Train To Be Discontinued.

CULEBRA, C. Z., February 3, 1912.

CIRCULAR No. 416-A:

Effective Februaty 15, 1912, the Gatun-Culebra labor train will be discontinued on account of the difficulty and danger of operating the train over the single track line of the relocation, which latter is to be used for all main line traffic of the Panama railroad on and after the date above mentioned.

American employes working at Gatun and occupying family quarters at other points along the line of the canal, who have been using the Gatun-Culebra labor train, will be furnished with a weekly round-trip pass good on Saturdays and Sundays until such time as they receive assignment to quarters at Gatun. The expense of this transportation will be borne by the Panama Railroad Company.

H. F. HODGES,
Acting Chairman, Isthmian Canal Commission.
Second Vice-President, Panama Railroad Company.

Dismantling and Remodeling of Equipment.

CULEBRA, C. Z., February 3, 1912.

ALL ACCOUNTABLE OFFICERS:

It is directed that in future no equipment be dismantled or remodeled so that it loses its identity in any manner without first securing approved survey request

H. F. HODGES,
Acting Chairman and Chief Engineer.

Notice to Masters of Vessels.

Dredging alongside of Balboa wharf reveals the fact that a good deal of illegal material is being thrown overboard from vessels alongside wharves. This is in violation of Rule 51 of the Navigation Laws of the Canal Zone.

It is requested that instructions be reissued to the officers and crew under your command, to the end that nothing be thrown overboard while in the harbor limits. Violations of the Rule will be prosecuted.

J. ST. C. HUNT, *Port Captain.*

Balboa, January 29, 1912.

Auction Sale of Calves and Dairy Cows.

On Saturday, February 17, at 10.00 a. m., there will be sold at public sale at the Ancon Hospital Dairy, two dairy cows between 7 and 10 years of age, and ten or more calves between 1 and 2 months old. Terms of sale, cash.

The dairy is located near the insane asylum buildings in the rear of the hospital grounds.

CHAS. F. MASON, *Superintendent.*

Misdirected Letters.

The following insufficiently addressed letters originating in the United States and its possessions have been received at the office of the Director of Posts and may be secured upon request of the addressees:

Total					$632,999.76			$632,999.76	
66 Naos Island breakwater		$6,531.80			$58,773.33			$65,305.13	
Total constructioncost, Pacific Division		$2,601,084.13			$20,867,526.56			$23,468,610.69	
67 Plant and equipment to be absorbed in construction costs after Dec. 31, 1911								$2,205,067.37	
Totaexpenditures, Pacific Division								$25,673,678.06	
68 Lighting and buoying canal		$37,329.20			$32,978.75			$70,307.95	
Total expenditures, constr. and engr'n'g.								$137,555,463.28	

Item 27—*Colon Breakwater* Figures shown include fill from Toro Point and large rock from Porto Bello.
Item 31—*Dredging Excavation, Prism.* Preliminary surveys.
Item 33—Operation of cement gun used in facing walls of Cut.
Item 36—*Dredging Excavation, Prism.* With the accounts for the month of April 1911, the total cost of the dredging plant had been absorbed into the work hence no abitrary for plant is charged in this quarter.
Item 49—*Miraflores Dams, Hydraulic Filling.* Expenditures represent cost of pipe lines, flumes, etc. 661,048 cubic yards havebeen deposited in dams from dredging and hydraulic excavations in lock chamber and in the prism below the locks, the total expenditures therefor being charged to "Excavation".
Items 63, 64, and 65—These expenses were incurred prior to the adoption of Miraflores as the site for the lower locks and dams, at the Pacific entrance to the Canal.
Items 28, 34, and 67—*Plant.* The expenditures for plant and equipment are absorbed into construction costs on the basis of estimated total cost of plant, and the estimated quantities of work to be done. The amounts shown under these items represent the balances which are to be obsorbed into construction costs after December 31, 1911.
General—When excavated material is used in filling, such as dams, back filling, etc., the cost of dumping only is charged to the items benefited, all other expenses be charged to "Excavation".

DAM CONSTRUCTION.

CANAL RECORD

Volume V. ANCON, CANAL ZONE, WEDNESDAY, FEBRUARY 14, 1912. No. 25.

The Canal Record

Published weekly under the authority and supervision of the Isthmian Canal Commission.

The Canal Record is issued free of charge, one copy each, to all employes of the Commission and Panama Railroad Company whose names are on the gold roll. Extra copies and back numbers can be obtained from the news stands of the Panama Railroad Company for five cents.

Address all Communications
THE CANAL RECORD,
Ancon, Canal Zone,
Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

New Developments in Culebra Cut Slides.

On the afternoon of February 10 a portion of the bank of Culebra Cut below the old French 90-meter level, on the east side of the Cut, opposite the village of Culebra and about 500 yards north of Gold Hill, broke off, carrying away the 95-foot berm and partly closing the recently completed drainage ditch in this locality. All tracks in the pioneer cut and to the eastward of it will have to be regraded and rebuilt. The amount of material in motion in this slide is about 250,000 cubic yards, but other cracks have opened to the south and east of the broken mass, on the old French 90-meter level, which apparently indicate that there will be a considerable addition in the near future, possibly as much more. The closing of tracks on the east side of the Cut will lessen the output for some days to come.

The old slide on the north end of the French dump on the west side of the Cut at Culebra has renewed its activity after a quiescence of over two years. It is estimated that 750,000 cubic yards of material are in motion. The boundary of the moving mass corresponds closely to that of the clay slide which moved into the Canal about two years ago, leaving underneath it stratified rock sloping about one on ten towards the Canal. This stratified mass has apparently broken off in a mass, 30 or 40 feet high on the face, and is advancing towards the prism at the rate of 18 to 24 inches a day. The ground has not heaved up in the bottom of the Cut. The material is easily handled.

Canal Work in January.

The grand total of Canal excavation to February 1 was 160,591,180 cubic yards, leaving to be excavated 34,732,199 cubic yards, or about one-fifth of the entire amount for the completed Canal.

The total for January was 2,641,444 cubic yards, as compared with 2,772,170 cubic yards in January, 1911.

The dry excavation amounted to 1,655,328 cubic yards, and was principally by steam shovels. The dredges removed 924,823 cubic yards, 991 cubic yards were sluiced in the Central Division, and 60,302 cubic yards at Miraflores, in addition to the amount pumped into Gatun Dam by suction dredges. The progress on the locks at Gatun, Pedro Miguel, and Miraflores is referred to elsewhere in this issue.

In the Atlantic Division, the total excavation was 607,502 cubic yards. Of this total, 34,495 cubic yards were dry excavation, and the remainder was removed by dredges in the Atlantic entrance.

The total excavation in the Central Division was 1,452,840 cubic yards, all of which was from the prism. The amount taken from Culebra Cut was 1,416,035 cubic yards, as compared with 1,350,497 cubic yards in January, 1911.

In the Pacific Division, the total excavation was 581,102 cubic yards, 351,816 cubic yards of which were taken out by dredging at the Pacific entrance.

A detailed statement of the excavation, and a summary of the work on the locks and dams, follow:

ATLANTIC DIVISION.

LOCALITY.	"Work" Excavation.	"Plant" Excavation.	Total excavation.

Total	2 580,217	61,227	2 641 444

Mean rainfall along Canal (ten stations), 0.22 inches.

By "Work" excavation is meant excavation actually made for one of the constituent parts of the Canal, such as prism, diversions, or locks, etc.; that is, it represents material taken from the area to be occupied by the Canal and constitutes excavation useful for the completed Canal.

By "Plant" excavation is meant excavation outside of any of the constituent parts of the Canal, such as prism, diversions, or locks, etc. It includes material necessary to be excavated for construction purposes only, and is chargeable against the particular plant item for which it is performed, such as prism, diversions, locks, etc.

DAM AND LOCK CONSTRUCTION.

MATERIAL.	Atlantic.	Pacific.	Total.
	Cu. Yds.	*Cu. Yds.*	*Cu. Yds.*
Concrete laid in locks.	34,983	63,493	98,476
Concrete laid in dams and spillways	8,905	....	8,905
Fill placed in dams	413,166	62,964	476,130

Channel through Miraflores Lake.

Operations have begun for the final excavation of the canal channel from Pedro Miguel Lock, through Miraflores Lake, to Miraflores Locks, a distance of 1¼ miles. A trench is being cut from the southern end of the lake area, intersecting a curve of the Rio Grande, to afford drainage for the prism. The area to be occupied by the channel is being cleared of brush, and a steamshovel has begun excavating immediately south of the site of the southwest wing wall at Pedro Miguel, and is working toward the lower end of the lake. The channel will be 500 feet wide. Inasmuch as the surface of Miraflores Lake is to be 55 feet above sealevel, the channel will have to be excavated only to an elevation of 10 feet, and as a considerable part of it is naturally at or below that level the excavation within this stretch will hardly exceed 800,000 cubic yards. The spoil will be used in the construction of Pedro Miguel Dam and for backfilling at the locks.

Extension of Backfilling at Gatun.

The backfilling along the locks at Gatun has been extended over a hundred feet at the lower end to afford foundation for the tracks on which move the towers of the cableways which are used for placing concrete in the walls. By this means the cables will be used in the construction of the extreme lower end of the center wall, the forms for the lower part of which have been placed since the completion of the bulkhead across the lower end of the locks. The backfill on the east side is practically completed for the upper and middle locks, while along the lower lock it has yet to be raised about 8 feet and later will be extended in conformation with the wing wall. On the west side the fill is completed for the upper lock and well advanced for the lower chambers.

Towing and Return Tracks at Locks.

The laying of rack and return tracks for the towing locomotives to be used in passing through the locks is in progress at Gatun and Pedro Miguel. At the latter lock about 400 feet of return track have been laid on top of the center wall, and preparations are being

NOTES OF PROGRESS.

(*Continued.*)

made for placing the two towing tracks, which parallel the common return track. At Gatun 16 sections of both towing and return track have been completed on the east side wall of the upper lock; 92 other sections, on the east and west walls of the upper lock, have been made ready for the placing of the concrete in which the tracks are embedded.

Each section is 6 feet long, and the weight of the completed rack track, exclusive of the concrete, is 1,460 pounds per section; for the return track, 720 pounds. About 330 tons of track are ready for the placing of concrete. The outer rail of the towing track is 4 feet 3 inches from the edge of the wall, except at the indented recesses for the lock gates. Over these the track projects about four and a half feet, being supported on seven irregular cantilever girders, averaging 11 feet 10 inches in length, the inner ends of which are anchored into the wall by means of vertical rods passing through the ends of the girders.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 79 per cent completed, 179,460 cubic yards, out of a total of 225,000, having been placed at the close of work on February 10. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Rock.	Hours worked	No. Mixers.
February 5...	444	....	16.00	2
February 6...	448	13	16.00	2
February 7...	400	....	16.00	2
February 8...	342	13	16.00	2

Grand total..	179,460			

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending February 10, follows:

DATE.	Hours worked.	Cubic Yards.
February 5....................	3.02	2,000
February 6....................	3.30	1,681
February 7....................	7.00	1,763
February 8....................	3.30	1,760
February 9....................	3.30	1,772
February 10....................	1.15	561
Total..........................	21.47	9,537

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending February 10, follows:

DATE.	Hours worked.	Cubic Yards.
February 5....................	5.30	1,870
February 6....................	6.30	2,085
February 7....................	6.15	2,186
February 8....................	6.50	2,292
February 9....................	4.05	2,129
February 10....................	6.25	1,858
Total..........................	35.35	12,420

Parlor Car Service.

In the operation of trains on the Panama railroad according to Schedule 11, in effect February 15, the parlor car will be operated only on trains 4 and 7, leaving Panama at 10.40 a. m., and Colon at 4.35 p. m., respectively

Explosion in Barge Causes Death.

Henry Ainsworth, Jamaican, employed at the Mount Hope marine shops, was asphyxiated on February 9 about 7.45 p. m. in an explosion of gas in the hold of Barge No. 10, one of the barges that are being towed around South America from Colon to Balboa. He and other laborers were using gasoline in cleaning off the inside of the barge when in some manner unknown the explosion occurred. Seven men were injured, two of them seriously. No property damage resulted.

CONCRETE WORK IN THE LOCKS.

Over 78 per cent of the concrete for the locks is in place, the amount at the close of work on February 10 being 3,287,064 cubic yards, out of a total of approximately 4,199,400. A total of 24,326 cubic yards of concrete was laid in the locks during the week ending February 10.

GATUN LOCKS.

Over 90 per cent of the concrete for the system of three twin locks at Gatun has been laid, the amount in place at the close of work on February 10 being 1,811,915 cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending February 10, and of the total, follows; and a similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone	Total.

STEAMSHOVEL RECORDS.

Work of Central Division and Panama Railroad Shovels.

During the month of January the total amount of material excavated in the Central Division was 1,452,840 cubic yards, of which 241,035 cubic yards were classified as earth, and 1,211,805 cubic yards, as rock.

Of this quantity 1,421,133 cubic yards were removed by steamshovels, 23,168 cubic yards by cranes, contractors removed 991 cubic yards by sluicing, and 7,548 cubic yards by hand.

The high record for the month was made by shovel No. 256 working 26 days in the Culebra District, which excavated 55,095 cubic yards of rock.

The second best record for the month was made by shovel No. 227, working 26 days in the Culebra District, which excavated 48,714 cubic yards of rock.

The best record for a shovel of the seventy-ton class was made by shovel No. 126, working 25 days in the Culebra District, which excavated 40,480 cubic yards of earth and rock.

Shovel No. 212, working in the Culebra District, made a high record for one day by excavating 2,964 cubic yards of rock on January 29.

Except where noted, monthly reports are computed by place measurement, while the daily reports are based on car measurement. The best record for the month and for one day are shown in the following table:

Relocated Line of Panama Railroad.

The total steamshovel excavation on the relocated line of the Panama railroad amounted to 320,035 cubic yards in January.

The best month's record was made by steamshovel No. 257, working on the Gatun Section, which excavated 4,000 yards of earth and 55,780 yards or solid rock, a total of 59,780 cubic yards.

In the 70-ton class, the best month's record was made by steamshovel No. 128, working near Empire, which excavated 35,550 cubic yards of earth.

The best day's record for shovels with a 5-yard dipper was made by steamshovel No. 257, which excavated 3,130 cubic yards of rock on January 13.

The best day's record for shovels with a 3-yard dipper was made by steamshovel No. 128 which excavated 1,930 cubic yards of earth on January 25.

Month's records are place measurement, and day's records are car measurement. All material was loaded in 10-yard Western dump cars.

LABOR FORCE AND QUARTERS IN JANUARY.

On January 10, the combined Canal and railroad force was 38,505, the second largest since the beginning of the work, the largest being that of March, 1910, when there were 38,676 employes. The force at the close of work on January 31 numbered 37,438 of whom 30,114 were employed on the Canal, and 7,324 on the railroad. The gold force on the Canal, composed almost entirely of white Americans, numbered 4,364. As compared with the force at the close of December, 1911, the total force on January 31 was 388 less, and compared with January, 1911, it was 167 more. The force report for January 31 follows:

Department.	Silver Employes.* Artisans. Monthly.	44 cents.	32 cents.	25 cents.	20 cents.	16 cents.	European Laborers. 20 cents.	16 cents.	West Indian Laborers. 20 cents.	16 cents.	13 cents.	10 cents.	7 cents.	Total Silver.	Total Gold.	Grand Total.

QUARTERS.

On February 1, there were 25,298 occupants of Commission quarters. Of these, 9,388 were white Americans of whom 5,371 were men, 2,067 were women, and 1,950 were children. There were 6,374 Europeans of the laborer class, of whom 5,711 were men, 269 women, and 394 children. There were 9,536 West Indian negroes, of whom 7,168 were men, 1,051 women, and 1,317 children. Included in the above were 301 Asiatics, and 78 Panamans.

COVER PLATES IN LOCKS.

Castings for Apertures Over Machinery Recesses.

The installation of lock machinery and electrical equipment involves the manufacture of 1,163 covers, varying in size from a circle of two-foot diameter, covering the smaller cable manholes, to a rectangle of nine by twenty-one feet covering the miter gate machinery recess. The openings to be covered are located in the roof of the machinery recesses, cable shafts, and operating tunnels of the lock walls in order that access may readily be gained to the machine parts. It is contemplated that the permanent equipment of the locks will include locomotive cranes, which will travel upon the towing tracks on top of the walls. In case of serious accident to the machinery, a crane will be sent down the lock wall to the seat of trouble the recess cover will be taken off, and the machine exposed for repairs.

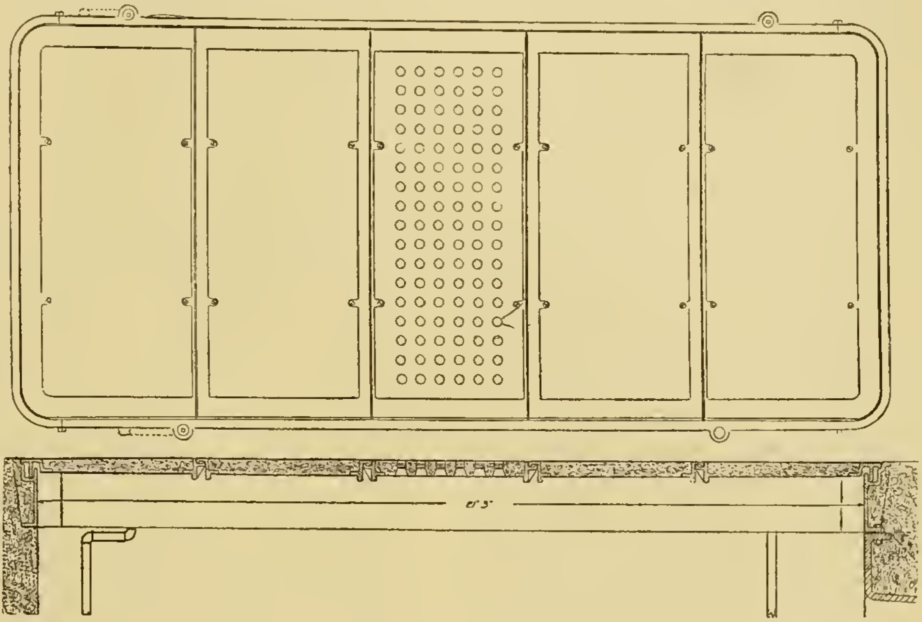
Covers are to be installed over the rising-stem valve machines, cylindrical valve machines, miter gate moving machines, chain fender machines, guard valve machines, auxiliary valve machines, float well chambers, transformer rooms, cable shafts, cable manholes, and certain special rooms and recesses. In addition, cover plates are to be installed over the conductor slots of the electric locomotive tracks—two to four bands of steel, each fourteen inches wide, stretching continuously the entire length of each of the lock walls.

The total weight of the cast iron which enters the construction of the machinery room covers amounts to 824 tons, and the weight of the conductor slot cover plates amounts to 1,023 tons. The cast iron covers and seats are to be manufactured at the Gorgona shops, while the rolled steel cover plates have been contracted for in the States with other track material.

The different machinery rooms and recesses require various designs and arrangements of covers. Some rooms require a single cover; others require two covers. Some covers are designed with a small cover seated within a larger one. A few covers are of highly special design to adapt the castings to other constructive features of the lock walls, such as vertical curves and other surface disfigurations In several cases the conductor slot must be cast integral with the covers, which involves quite complicated castings.

The cover over the cylindrical machines is illustrative of the general design of small covers. It is very desirable that daylight be utilized as far as practicable to illuminate the machinery recesses and operating tunnel, and in order to obtain daylight, the majority of the covers include a number of glass prisms such as are used in vault light construction. In the cover for the cylindrical valve, eighteen glass prisms are set in neat cement on a perforated cast iron frame. The cover rests in a cast iron seat which is solidly imbedded in the concrete decking over the recess. In the center of the cover there is provided a cored hole which serves a double purpose; first of inserting a bolt to clamp through an underhanging yoke in order to tighten the cover down upon a gasket seat and prevent leakage of water over the machinery below, and, second, of inserting a lifting bolt to hook upon a crane hook. If necessary, the joint between cover and seat can be calked.

Typical of a large cover is the design used over the miter gate moving machines. Here access must be available to the large crank gear which drives the strut of the massive miter gates, and an immense cover is necessary on this account. As shown in the illustration herewith this cover is sectionalized in five parts, all resting upon a common seat which is either imbedded in solid masonry or supported from steel framing. Each of the five covers consists of a cast iron rim which contains a heavily reinforced concrete slab designed to support five hundred pounds per square foot. The middle slab contains a large number of deck lights for natural illumination below. Each of the covers is cast with four bolt holes for inserting ring bolts by means of which the piece can be lifted with a crane. As is the case with the cover over the cylindrical valve recess, the cover over the crank gear should not leak under tropical downpours, and in order to insure freedom from dripping the covers and seats are drained. The draining is accomplished by making the joints between covers male and female, the female portion draining the water toward each end where the covers overlap a gutter which is cast into the cover seat. The gutter in the cover seat slopes to a drain pipe which connects to a sump in the floor of the machinery room.



PLAN AND SECTION OF COVER FOR RECESS FOR MITER GATE MOVING MACHINERY.

For cable manholes outside the operating tunnel, a solid cast iron cover, two feet in diameter, with a light T-section rim, is designed. It is not necessary that this cover be water-tight. The cable manholes and handholes through the operating tunnel are to be covered with plain reinforced concrete slabs. Specially difficult designs are encountered in the covers over the guard valve recesses, which are located directly under a vertical curve. These covers in addition embody a conductor slot and track support cast solid with the piece.

In order to obtain natural daylight in the operating tunnels, there has been developed a deck-light slab, which covers an opening 15 inches by 18 inches. The openings are spaced on fifteen-foot centers throughout the entire length of tunnel, and alternate in spacing with the electric lamps used to illuminate artificially the tunnel, the lamps also being spaced upon fifteen-foot centers. In this form of deck-light, twelve glass prisms are embedded in a reinforced concrete slab, which in turn is cemented into the rabbets of the 12 by 18-inch opening through the decking over the operating tunnel.

The manufacturing of covers is to be done in as regular manner as possible and will continue until March, 1913. This month's output will be in the neighborhood of 34,000 pounds, whereas the estimated product of succeeding months will vary from 75,000 pounds to 150,000 pounds.

CLASSIFIED EXPENDITURES.

A statement of classified expenditures of the Isthmian Canal Commission to December 31, 1911, follows:

PERIODS.	Department of Civil Administration	Department of Law	Department of Sanitation.	Department of Construction and Engineering	General Items.	Fortifications.	Total
To June 30, 1909	3,427,090.29	....	9,673,539.28	69,622,561.42	78,022,606.10	....	160,745,797.09
Fiscal year, 1910	709,351.37	....	1,803,040.95	26,300,167.05	2,863,088.83	....	31,675,648.20
Fiscal year, 1911	755,079.44	....	1,717,792.62	27,463,401.31	3,112,334.60	....	33,048,607.97
July, 1911	72,895.22	2,527.35	137,635.83	2,089,361.82	312,920.11	....	2,615,340.33
August, 1911	74,768.45	1,878.27	156,954.79	2,287,506.30	355,087.42	86,243.14	2,962,438.37
September, 1911	64,905.24	1,805.83	146,912.23	2,212,702.66	234,233.58	86,275.56	2,746,835.10
October, 1911	64,143.49	1,586.71	152,252.71	2,751,377.24	323,154.80	32,061.45	3,324,576.40
November, 1911	66,491.92	2,502.39	138,404.22	2,346,719.44	200,614.00	93,952.56	2,848,684.53
December, 1911	66,013.49	1,854.62	143,745.59	2,467,291.16	316,891.32	60,794.07	3,056,590.25
Total	5,300,738.91	12,155.17	14,070,278.22	137,541,088.40	85,740,930.76	359,326.78	243,024,518.24

SOCIAL LIFE OF THE ZONE.

Literary Activities of Women's Clubs.

The home department of the Cristobal Woman's Club held a Dickens afternoon on Wednesday, February 14. The program consisted of a paper on the novelist, and readings from his works.

The Empire club will meet at the home of Mrs. Hudson, Empire, on Thursday, February 15. The regular study on India will be continued.

The subject for the meeting of the Paraiso Woman's Club on Wednesday, February 21, is "American Artists and Their Work." Members are requested to invite their friends. The program meetings of the club will be open.

The Ancon Study Club had for its program on Thursday, February 8, the French occcupation of Panama, a paper being read by Mrs. Shick. A paper on a visit to Fort San Lorenzo was read by Mrs. Hunter, and the members responded to roll call with short items dealing with some phase of Panama life or history. The meeting on Thursday, February 15, will be held at the home of Mrs. M. White. The subject is the American occupation. This will be divided under three heads; sanitation, quartering the force, and subsistence.

Civil Service Examinations.

A supply of the Manual of Examinations for the spring of 1912 has been received in this office.

The following examinations will be held beginning probably about the third Sunday in March and applications therefor will be received until February 28: assistant, Philippine Service; assistant inspector, and local inspector, of boilers; assistant inspector, and local inspector, of hulls; bookkeeper, Philippine Service; civil engineer, Philippine Service; civil engineer student, Departmental Service; copyist topographic draftsman, topographic draftsman, Departmental Service; junior engineer draftsman, Engineer Department at Large; forest assistant, Forest Service; forest assistant, Philippine Service; industrial teacher, Philippine Service; junior engineer (mechanical), junior engineer (mining), Bureau of Mines; kindergarten teacher, Indian Service; matron, Indian Service; physician, Indian, Isthmian Canal, Philippine, and Public Health and Marine-Hospital Services, and Coast and Geodetic Survey; postal clerk, Isthmian Canal Service; teacher, Philippine Service; veterinarian, Philippine Service; and veterinary inspector, Departmental Service. Women will be admitted to the copyist topographic and topographic draftsman examinations, and may be admitted to the teacher, Philippine Service, examination; women only will be admitted to the kindergarten teacher and matron, Indian Service, examinations.

In requesting application blanks for any of the above-named examinations the exact title thereof as given above should be stated. In filing applications the date of examination should be *omitted.* In answering questions in regard to bona fide residence, such residence must be shown in a State or Territory of the United States, and county thereof, *up to the time of filing application.*

It is to be noted that the examination for clerk, Isthmian Canal Service, will *not* be given during the spring of 1912. No inquiry in regard thereto should therefore be made before August 1, 1912. JOHN K. BAXTER,
Secretary, Isthmian Civil Service Board.

COMMISSION CLUBHOUSES.

Activities of the Young Men's Christian Association.

PENTATHLON ATHLETIC MEET.

On Thursday, February 22, the Y. M. C. A.'s will hold a Pentathlon Athletic Meet at the Empire Baseball Park. This style of meet differs from the regular kind in that there are only five events and each contestant competes in all of the events, receiving a final score based on the exact record he made in each event. A possible hundred points can be made in each of the five events: 100-yard dash, 12-pound shotput, running high jump, pole-vault, and half-mile run. A contestant whose total points are between 200 and 299 inclusive wins a bronze medal, 300 to 399, a silver medal and 400 or over, a gold medal. Special events are a four-man relay race, running broad jump for boys, and 75-yard dash for boys. The entries closed Saturday, February 10, with a total of 56 distributed as follows: Cristobal 5, Gatun, 7, Gorgona 11, Camp Elliott 11, Camp Otis 6, Empire 6, Culebra 5, Corozal 5. There will be music by the Isthmian Canal Commission Band.

MOVING PICTURES.

The moving picture schedule for the week of February 19 to 24 is as follows: Monday, Empire; Tuesday, Corozal; Wednesday, Culebra; Thursday, Gatun; Friday, Cristobal; Saturday, Gorgona.

COROZAL.

About 125 people attended the meeting of the Debating Society last Monday night. The program consisted of a debate, a song by Mr. Stapleton, several songs by the Paraiso Quartette and three selections by the Corozal instrumental quartette. President Bennick presided at the meeting.

Carpenters are now working on the addition to the clubhouse. In addition to the bowling alleys there will be shower baths, a locker room, a barber shop, committee rooms and a veranda on the side of the present hall.

Regular practice is being held to develop an indoor baseball team. Mr. Lofgren has been elected captain.

CULEBRA.

The following is the standing in the chess tournament.

Name.	Won.	Lost.	Draw.
Bartlett	6	5	
Dubois	7	4	1
Goodenow	6	6	
Erickson	4	9	
Janney	7	6	1
Newman	3	9	1
Sterns	6	2	1
Vogel	1	1	
Warner	4	2	

The following are the high scores in duckpins: Cornthwaite, 115; Dunfey, 103; Case, 102; Bartlett, 101; Van Zandt, 110; Fay, 104; Mengel, 100.

On Friday evening the Empire men played pool and billiards with the following result: *Billiards*—DuBois (Culebra), 73, Smith (Empire), 100. Tragsdorf (Culebra), 100, Wood (Empire), 42. *Pool*—Flynn (Culebra), 100, Davis (Empire), 60. Hillery (Culebra), 107, McCullough (Empire). 125. Steavens (Culebra), 87, McKeever (Empire), 100.

EMPIRE.

The following high scores were bowled on the alleys during the past week: Candle pins—Nelson, 100, 102; Pinney, 112, 101; Grund, 111; Rodeighiro, 105, 102, 107; H. King, 106; Dakin, 105, 102; Parkis, 104; Goolsby, 104; Gustaveson, 103, 101. Duck pins—Rodeighiro, 104, 106, 117, 106, 107, 116; Dakin, 112, 101; Gorham 110, 100.

Twenty-two men have entered the February pool tournament.

On Sunday night, February 11, the Sunday evening song service was led by Mr. Booz of Gorgona. Mrs. McLeod played two selections on the violin, accompanied by Mrs. King, after which Mr. Safford of Camp Elliott gave a talk on "Progress." There was an attendance of one hundred and fifty.

On Saturday night, February 17, the Eberly Concert Company will be at Empire. Reserved seats on sale on Thursday, February 15.

GORGONA.

The next Sunday night song service will be held on February 18 at 7 o'clock. There were 93 present on Sunday night, the 11th. Special music was furnished by Messrs. Kuentz, M. Booz, and Hopkins.

There were 24 entries at the Checker Club "smoker" on Saturday night, February 10. Refreshments were served. Messrs. Miller and Taylor tied for first place, the latter finally winning the contest.

There were 279 present at the moving picture show, February 12. Mrs. Shady and Mr. Reinhold furnished special music.

GATUN.

W. C. Gayer, member of the executive council, led the discussion club on Sunday evening, February 11. The subject was "Christian Politics." Among those who spoke were: Frederickson, Dillon, Smith, Kitts, Klowan, St. Clair, and Langley. The subject for next Sunday night will be the "The Emancipation of the Voter."

Wm. N. Swain, of Boston, Mass., gave an address on "The Value of the Cooperative Bank" on Monday evening, February 12.

An order for a large number of books will be mailed this week. Among them are full sets of Mark Twain and Shakespeare.

The program for the smoker on Saturday night, February 17, will include: Tenth Infantry Orchestra; Mr. Bronson, pianist and accompanist; Emery and Cogan, black face artists; Stapleton, contortionist; Tudor, balancer and juggler; Huber and Nabsted, wrestlers; Tropical Quartet, Dickson, Ross, Kersey and Case; Vierbuken, rag-time soloist.

The first interassociation indoor athletic meet held on the Zone was conducted in the Gatun clubhouse on Saturday evening, February 10. Six clubhouses and Camp Elliott were represented with 53 entries. For the pole vault DeCora (Cristobal) and Barcroft (Culebra) vaulted for over 45 minutes when the event was announced as a tie for first place. The jumping of Chadbourne of Corozal and Koperski of Empire was a feature. Chadbourne's jump of 5 feet 6¼ inches establishes a new record for the Isthmus. This meet has stimulated interest in the athletic meet to be held at Empire on February 22. The officials were: Referee, Fred Huber of Gatun; Clerk of Course, W. E. Burrell, Cristobal; Starter, J. T. Hopkins, Gorgona; Announcer, Charles Ourand, Gatun; Inspectors, Smith of Gatun, Warr of Empire; Marshal, Bill Settlemire of Gatun; Timekeepers, Foman of Gatun, Geer of Corozal, Doran of Empire; Judges, Safford of Camp Elliott, LaMont of Gatun, and Garrett of Empire; Chairman of Committee of Arrangements, R. L. Dwelle of Gatun. The points were won as follows: Empire 23, Culebra 20, Cristobal 11, Gorgona 10, Camp Elliott 9, Corozal 5, Gatun 3. The various events and respective winners are as follows:

Twenty-Yard Dash—First, Mathues, Cristobal; second, Marshall, Camp Elliott; third, Luttrell, Empire.

Twelve Pound Shot Put—First, McDonald, Empire; second, Anderson, Camp Elliott; third, Luttrell, Empire.

Potato Race—First, Ellsworth, Culebra; second, Barlett, Gatun; third, Whittles, Cristobal.

Running High Jump—First, Chadbourne, Corozal; second, Koperski, Empire; third, Knapp, Camp Elliott.

Pole Vault—First, Barcroft, Culebra, tied with DeCora, Cristobal; second, Simms, Gorgona.

Human Wheelbarrow Race—First, Luttrell and Koperski, Empire; second, Cornthwaite and Ellsworth, Culebra; third, Anderson and Gabriel, Camp Elliott.

Standing Broad Jump—First, Cornthwaite, Culebra; second, Luttrell, Empire; third, Robinson, Gorgona.

Obstacle Race—First, Buis, Gorgona; second, Ellsworth, Culebra; third, Whittles, Cristobal.

Eight-Man Relay Race—First, Empire team; second, Gorgona team; third, Camp Elliott team.

Mrs. Blanche Caldwell of Cristobal sang several solos at the moving picture entertainment on Tuesday, February 6. Mr. Bronson acted as accompanist.

A three-cushioned billiard tournament was started on Monday, February 12.

CRISTOBAL.

A complete root beer fountain has been installed.

On Friday evening, February 16, the Eberley Concert Company, which is due to arrive from the States the preceding day, will give a select programme. Admission, members free, non-members, 50 cents.

On Thursday evening, February 22, the Tenth Regiment Band will give a Washington's Birthday concert. The programme will be rendered out of doors, using the Isthmian Canal Commission bandstand.

High scores for the week, February 10: Duck pins—Barte, 125, 110, 108, 110, 106, 105, 105, 102; DePootrer 126; Herring, 125, 121; Green, 107; Jacques, 111, 101; Barrett, 105, 105; Smith, 104; Herrington, 102; Hess, 101; Weston, 110, 110, 105; Gibson, 106, 104; DeLong 117, 107, 102. Ten pins—Beattie, 223; W. Burns, 204. Candle pins—Weston, 124.

The score of a duck pin match between Gatun and Cristobal follows:

Gatun.				Cristobal.			
DePoorter	82	99	126	Barrett	85	93	90
DeMoll	81	81	91	Gibson	92	92	86
Green	92	89	107	Herrington	86	98	80
Wurster	84	95	81	Smith	95	88	96
Barte	91	91	93	Herring	84	95	121
Total	430	455	498		442	466	473

Band Concert.

A band concert will be given by the Isthmian Canal Commission Band at Bas Obispo, C. Z., on Sunday, February 18, 1912, at 6.00 p.m.

The next concert will be given at Culebra, on February 25, at 5.45 p. m.

OFFICIAL CIRCULARS.

Saturday Night Train Service.

CULEBRA, C. Z., February 6, 1912.

CIRCULAR No. 286-B:

On the new schedule, which will be put into effect when the relocated line is opened February 15, two Saturday night trains each way will be operated. These Saturday night trains are put on for the convenience expecially of employes who wish to attend entertainments of various kinds along the line, and hereafter no special trains of Commission equipment will be authorized to be operated on the Panama railroad main line.

If employes find it necessary to have train service on other that Saturday nights, they will be allowed the employes' rate for special trains upon application to this office. These will be made up of Panama railroad equipment and operated by Panama railroad crews, the train to consist of an engine, baggage car and one coach, with extra charge for extra coaches. Rates will be quoted by any Panama railroad agent upon application.

H. F. HODGES, *Acting Chairman.*

Amendment of Civil Service Rules.

CULEBRA, C. Z., February 8, 1912.

CIRCULAR No. 432:

The President issued an Executive Order under date of December 9, 1911, amending the civil service rules, from which the following two paragraphs are quoted:

2. A person whose removal is proposed shall be furnished with a statement of reasons and be allowed a reasonable time for personally answering such reasons in writing; but no examination of witnesses nor any trial or hearing shall be required except in the discretion of the officer making the removal. Copy of such reasons and answer, and of the order of removal shall be made a part of the records of the proper department of office, and the Commission (U. S. Civil Service Commission) shall upon its request be furnished with a copy of the record in the case. The above procedure shall be followed in like manner in any reduction in grade or compensation.

2. Pending action under Section 2 of this rule a person may be suspended or temporarily dismissed without notice for a period not to exceed thirty days, but the reasons for such suspension or dismissal shall be filed in the records of the proper department or office.

The foregoing order is applicable to classified positions under the Isthmian Canal Commission. These positions are those of Clerk, Bookkeeper, Stenographer, Typewriter, Surgeon, Physician, Trained Nurse and Draftsman.

H. F. HODGES,
Acting Chairman.

Shop Expense Percentage.

CULEBRA, C. Z., February 3, 1912.

HEADS OF DEPARTMENTS AND DIVISIONS:

In accordance with the provisions of Circular No. 169-E the following shop expense percentage for each shop is hereby fixed effective February 1, 1912, and will be applied, until further orders, to the distributed labor used in all shop work in accordance with the provisions of Circular No. 264-A, viz:

Division or shop.	Shop expense percentum.
Mechanical Division	35
Empire shop	20
Dry Dock shop	50
Balboa shop	25
Porto Bello shop	30
Toro Point shop	40
Panama Railroad shop	30

Previous circular letters from this office, fixing shop expense percentage, are revoked.

H. F. HODGES,
Acting Chairman, Isthmian Canal Commission.
Second Vice-president, Panama Railroad Company.

Classified Expenditure Accounts.

EMPIRE, C. Z., February 5, 1912.

CIRCULAR No. 36:

The following new accounts and amendments have been authorized in the Classified Expenditures, Isthmian Canal Commission:

NEW ACCOUNTS.

Atlantic Division—

Account 318. Terminal Facilities—Cristobal.

(a) Construction.

To this account will be charged all expenditures for labor and material used in the construction and maintenance of the permanent terminal facilities at Cristobal.

(b) Plant.

This account will be opened with a charge for the value of plant heretofore purchased for or used in the construction of the permanent terminal facilities at Cristobal and for plant hereafter purchased for or used therein; also to be charged with plant transferred from other divisions or units of the work and credited with plant transferred from this work.

Pacific Division—

Account 342. Terminal Facilities—Balboa.

(a) Construction.

To this account will be charged all expenditures for labor and material used in the construction and maintenance of the permanent terminal facilities at Balboa.

(b) Plant.

This account will be opened with a charge for the value of plant heretofore purchased for or used in the construction of the permanent terminal facilities at Balboa and for plant hereafter purchased for or used therein; also to be charged with plant transferred from other divisions or units of the work and credited with plant transferred from this work.

AMENDMENTS.

General Items—

Account 402. Cristobal Terminals.

(a) Docks and Wharves—Amended as follows: To this account will be charged all expenditures for labor and material used in the construction and repair of wooden docks and wharves at Cristobal including the tracks laid thereon, together with all machinery, tools, supplies, etc., that may be used in construction and renewals of same.

Account 403. Balboa Terminals.

(a) Docks and Wharves—Amended as follows: To this account will be charged all expenditures for labor and material used in the construction and repair of wooden docks and wharves at Balboa including the tracks laid thereon, together with all machinery, tools, supplies, etc., that may be used in construction and renewals of same.

H. A. A. SMITH,
Approved: *Examiner of Accounts.*
H. F. HODGES,
Acting Chairman and Chief Engineer.

Supplies for Canal Work.

The following steamers, with supplies for the Isthmian Canal Commission, arrived at the ports of Cristobal, Colon, and Balboa, during the two weeks ending February 10:

Colon, January 28, from New York, with 33 pieces pipe fittings, 9 barrels wheels and chains, 44 packages castings, for Pacific Division; 12 bundles car springs, 100 pieces castings, for Mechanical Division; 40 barrels screw spikes, 10,600 pieces splice bars, for Panama Railroad Company; 7 cases air brake material, 10 cases steel lockers, 80 cases paint, 9 cases steamshovel parts, 34 rolls grass rugs, 100 cases lye, 60 bundles roofing iron, 68 barrels sea coal facing, 35 coils manila cable, 100 bundles car springs, 20 cases chloride of lime, 37 barrels rosin, 30 barrels pitch, 546 bales hay, 146 pieces lumber, 11 kegs bolts, for stock; and a miscellaneous cargo, the whole consisting of 12,139 packages, weighing 446 tons.

Trent, January 28, from New York, with 130 coils steel rope, 229 pieces pipe, for stock.

Prinz Sigismund, January 30, from New York, with 89 bales waste, for stock.

Median, January 30, from Liverpool, with 329 barrels carbolic acid, for stock.

Nordpol, January 30, from New York, with 97 cases blasting caps, 188 drums gasoline, for stock; 120,698 bags cement, for Atlantic and Pacific Divisions.

Santa Marta, February 1, from New York, with 30 cases hardware, for stock.

Heredia, February 2, from New York, with 47 pieces castings, 52 bundles castings, for Atlantic Division; 27 pieces pipe, for Pacific Division; 1,423 pieces car lumber for Mechanical Division; 25 cases paint, 8 pieces frogs, 29 rolls cotton duck, 800 cases cup grease, 16 barrels non-liquid oil, 240 drums locomotive engine oil, 240 drums stationary engine oil, 480 cases black grease, 380 drums kerosene, 213 pieces castings, 3,205 pieces yellow pine lumber, 45 pieces piling, for stock.

Turrialba, February 3, from New York, with 21 cases tape fuse, 7 cases harness oil, for stock; 54 crates bolts, 18 cases bolts, for Atlantic Division.

Otta, February 3, from Baltimore, with 8,000 cases dynamite, 1,460 kegs nails, 2,167 pieces sewer pipe, 40 cases putty, 5 barrels paint, 160 kegs washers, 25 crates reed rockers, 300 kegs spikes, 600 kegs bolts, 8,000 bundles tie plates, for stock; 400 pieces castings, (lock material), 24 bundles castings, (lock material), 60 cases castings (lock material), 15 pieces cast iron pipe, 360 pieces sewer pipe, 102,804 pieces vitrified tile, 61 bundles rails and channels, 158 bundles rack castings, 16 cases bolts and washers, for Atlantic Division; 248 pieces castings (lock material), 38 cases castings (lock material), 26 bundles castings, (lock material), 314 pieces steel beams, 9 pieces pipe, 35,680 pieces vitrified tile, 64 bundles rack castings, 113 pieces steel ties, 183 bundles rails and channels, 13 cases bolts and washers, 8 kegs bolts and washers,for Pacific Division; 219 pieces car couplers, 69 pieces knuckles, 354 pieces white oak lumber, 30 packages 2-locomotive cranes, for Mechanical Division; 862 pieces steel plates, 601 kegs rivets, for Panama Railroad Company.

Advance, February 3, from New York, with 61 packages spillway castings, for Atlantic Division; 115 kegs bolts, 67 cases bolts, for Pacific Division; 34 pieces steel plates, 500 pieces steel knuckles, 12 barrels castings, 500 pieces car couplers, for Mechanical Division; 17 cases bolts and nuts, 500 bundles shovels, 10 cases electrical material, 32 barrels rosin, 26 cases rubber hose, 10 cases lubricating oil, 100 drums thermit, 200 kegs oxide of zinc, 16 cases air brake material, 55 pigs lead, 1,495 pieces pipe, 223 bundles pipe, 31 bundles steel plates, 150 drums paint, 82 barrels paint, 60 cases picks, 75 cases caustic soda, 12 cases valves, 120 cases signal oil, 36 pieces lumber, for stock; and a miscellaneous cargo, the whole consisting of 4,784 packages, weighing 360 tons.

Prinz August Wilhelm, February 5, from New York, with 91 bales cotton waste, 9 cases hardware, for stock.

Mackinaw, February 5, from San Francisco, with 1,351 pieces lumber, for stock.

Atenas, February 8, from New Orleans, with 66 pieces piling, 674 pieces lumber, for stock; 881 pieces lumber, 51 barrels brake shoes, for Mechanical Division; 25 pieces castings, 26 bundles castings, 20 crates concrete mixers, for Atlantic Division; 162 pieces water pipe, for Pacific Division; 75 sacks dairy feed, 100 cases paint, for stock.

Navajo, February 8, from San Francisco, with 750 cases dynamite, 1,332 bales hay, for stock.

Statesman, February 8, from Liverpool, with 6 pieces dredge buckets, for Pacific Division.

Metapan, February 8, from New York, with 15 cases wire, 14 cases files and punches, 13 cases hardware, for stock.

Riverside, February 8, from Columbia River, Oregon, with 52,407 pieces lumber, for stock.

Panama, February 9, from New York, with 33 pieces snubbing posts, 170 bundles wire mesh, 8 cases pumps, for Atlantic Division; 206 bundles mesh reinforcement, 25 cases leadite, for Pacific Division; 70 kegs potash, 37 bundles springs, for Mechanical Division; 34 pieces derails, for Panama Railroad Company; 9 cases steel book cases, 13 cases dry goods, 22 cases drugs and sundries for Sanitary Department; 31 cases desks, for Department of Civil Administration; 10 cases harness, 20 cases chalk, 150 cases oil, 67 pieces frogs and switches, 34 bundles rubber hose, 264 bundles roofing iron, 10 bundles steel bars, 14 rolls cotton duck, 95 coils rope, 43 crates handles, 8 bales packing, 100 crates refrigerators, 11 cases emery cloth, 100 cases caustic soda, 36 cases air brake material, 50 bundles claw bars, 75 cases soap, 250 rolls roofing paper, 14 bundles mop heads, 200 drums thermit, 262 drums oil, 250 kegs bolts, 94 kegs washers, 16 packages castings, for stock; and a miscellaneous cargo, the whole consisting of 2,952 packages, weighing 365 tons.

Tivives, February 10, from New York, with 54 cases washers, 5 cases stationery, for stock.

Married.

HAMMOND-MACSPARRON—On February 8, in the DeLesseps Building, Cristobal, Miss Gladys MacSparron of Philadelphia, Pa., to Arthur Henry Hammond of Glens Falls, N. Y., the Rev. Carl H. Elliott officiating. Isthmian residence, Colon.

Family Quarters.

Applications for married quarters were on file on February 1, as follows:

DISTRICT.	List No. 1.	List No. 2.

Auction Sale of Calves and Dairy Cows.

On Saturday, February 17, at 10.00 a. m., there will be sold at public sale at the Ancon Hospital Dairy, two dairy cows between 7 and 10 years of age, and ten or more calves between 1 and 2 months old. Terms of sale, cash.

The dairy is located near the insane asylum buildings in the rear of the hospital grounds.

CHAS. F MASON, *Superintendent.*

COMMISSARY DEPARTMENT.

The commissaries are open during the following hours:

Cristobal, 8 a. m. to 12.30 p. m., and 2 to 7 p. m.
Balboa, 8 a. m. to 12.30 p. m., and 2.30 to 7 p. m.
Ancon, 8 a. m. to 1 p. m., and 3 to 6 p. m.
All others, 8 a. m. to 1 p. m., and 3 to 7 p. m.

Retail prices of cold storage provisions for the week beginning February 14, 1912.

Isthmus of Panama.

No communication, either for publication or requesting information, will receive attention unless signed with the full name and address of the writer.

NOTES OF PROGRESS.

Slides in Culebra Cut.

It is estimated that there remain to be excavated from Culebra Cut on account of slides 4,300,000 cubic yards, about 28 per cent of the total remaining excavation from this section, which at the end of January was 14,525,146 cubic yards. The excavation in the Cut is about 84 per cent completed. The additions of material to be excavated do not affect the estimated total cost, because the unit cost of excavation, $0.6188 per cubic yard in the past quarter, is below the estimate by 36 cents a yard. Neither do they affect the estimated time of completion, because the force has steadily increased in efficiency.

West Wing of Gatun Dam.

Since the completion of the hydraulic fill for the east section of Gatun Dam, the dredges which were employed in pumping fill into it have been shifted to operating on fill for the west section, with the present exception of dredge *No. 82*, which is placing a heavy clay fill along the base of the upper approach wall of Gatun Locks.

The two dredges on the north, or sea, side of the dam, one of which is east and the other west of the spillway discharge channel, have not changed their borrow pits, but both are now pumping into the west section. The pipeline from dredge *No. 86*, which is at work east of the channel, connects with a relay pumping station erected about midway between the resident engineer's office and the Spillway field hospital, and passes over the channel on the railroad bridge to the west section. This pumping station was formerly on the north toe of the east wing. A second relay will be connected with this line within a few days. Dredge *No. 85*, which was working on the lake side of the dam, along the Chagres River about half a mile above the spillway intake, has been moved and is now pumping heavy clay along the lower edge of the south toe at a point about 100 yards from the extreme west end of the dam.

The west section of the dam has the appearance of a great arch springing from the spillway on the east to the hills on the west, the arch projecting into Gatun Lake against the pressure of the impounded water. Its length is to be 8,000 feet; its greatest width 3,000 feet, and its final elevation about 105 feet above sealevel. The height of the wing is now about 80 feet above sealevel. It is estimated that 5,621,623 cubic yards of dry and 6,148 343 cubic yards of wet material will be required for the west wing. Of this, 4,104,041 and 4,772,981 cubic yards, respectively, have been placed, so that the wing is now about 75 per cent completed.

About three hundred yards from the west end the toes of the dam pass on both sides of a row of small knolls, the highest of which rises to 110 feet above sealevel. The wet fill is made around these and deep trenches are cut into them to allow the dam to weld together more securely.

Trestle for Concrete Trains at Miraflores.

A trestle has been constructed from the upper to the lower lock level in the east chambers at Miraflores Locks for the purpose of hauling concrete from the auxiliary mixing plant in the east wall of the upper chamber to the placing cranes and derricks in the lower chamber. Double tracks of 3-foot gage have been laid, with a fifth rail placed 2 feet outside of one of the tracks, to make a 5-foot track for the occasional use of locomotives and cranes which have the gage made locally standard by the Panama railroad. The trestle is 430 feet long, with a grade of 7 per cent. The supports, the highest of which is 31 feet, are trapezoidal bents of heavy timbers, placed 15 feet apart and connected by 10 stringers, 8 by 16 inches in section. Square cross ties, 8 inches on the side, are placed on 2-foot centers. Practically all of the timbers came from the dismantled trestle which had been in similar use at Pedro Miguel Lock.

Along one side of the trestle, at an elevation of 2 feet 9 inches above the top of the rails, extends a platform, 2 feet 6 inches wide. This is for the use of the men who attach to the buckets of concrete, which are brought on flat cars from the mixer, the hooks from the crane which raises the buckets and carries them to the place at which they are to be dumped.

Lower Chamber of Miraflores Locks.

The laying of concrete in the west wall for the lower lock at Miraflores has been begun and foundation has been placed for a distance of about a hundred feet. In the center wall only a portion of the sills at the upper end has been laid. The foundation for the east side wall, where two berm cranes have been engaged in mixing and placing concrete, has been extended about 500 feet from the upper end and the wall over this portion is in various stages of completion, from several feet above foundation to about three-fourths of full height. For a distance almost as great the floor for the east chamber, with its arrangements of drainage culverts and "lily forms" beneath, is completed from the side wall to the site of the center wall. The site for the lower chambers has been excavated to full depth, which is such as to make the level of the floor 51 feet below mean tide, over a distance of 500 feet from the upper end and the eight steamshovels employed there are advancing to the south in the wake of the hydraulic monitors.

Buildings in Lake Area.

In preparation for the rise of Gatun Lake, buildings in the villages of Bohio, Frijoles, San Pablo, and Tabernilla have practically all been sold or destroyed, or removed to other villages and reconstructed by the Commission.

At Bohio the schoolhouse was demolished and all of the camps and quarters, except a few small buildings left standing temporarily for construction purposes, were sold. Of these there were 19 buildings and the aggregate receipts were $707. At Cartagenita 11 camps were sold for $610; "silver" married quarters and some sheds aggregated in value $77. A few construction buildings are still standing. No houses were moved from these villages by the Commission.

The police station at Frijoles was moved to New Frijoles, on the relocated line of the Panama railroad. The sanitary storehouse was sold for $5, and the "silver" bachelor and married quarters (2 buildings) were sold for $10 and $60, respectively.

At San Pablo and its associated villages of Caimito and Mamei, 43 buildings, comprising "gold" and "silver" married and bachelor quarters, the dispensary, storehouses, camps, commissary building and a number of smaller structures, were sold for a total of $2,133.50. Two camps, a colored schoolhouse, some married quarters, the dog pound and outhouses were demolished. One "gold" married quarters house was removed to Corozal for bachelor quarters; another to Colon to be erected at the quarantine station, and three to Las Cascadas for the Tenth Infantry. The jail was taken to Monte Lirio and a European laborers' mess was moved to Mandingo, to be converted into a schoolhouse.

From Tabernilla the police station was removed to Gamboa; two "gold" family houses, one non-housekeeping quarters and the material from a European laborers' messhall were removed to Las Cascadas for the Tenth Infantry. The commissary building is to be made into bachelor quarters at Corozal; the schoolhouse was removed to Mount Hope and one "gold" married quarters was taken to Gatun for employes of the McClintic-Marshall Company. A number of sheds, small storehouses, range closets, the post mortem building and similar small structures, were de-

NOTES OF PROGRESS.

(*Continued.*)

molished. Forty-seven buildings, including quarters, fire station, church, schoolhouse and camps, were sold for an aggregate of $3,448.25.

Corrected Time Table.

The Panama railroad timetable published in this issue of THE CANAL RECORD contains corrections made after the publication of the table in the issue of February 7. The most important changes are that Train No. 4 leaves Panama at 10.55 o'clock week day mornings instead of at 10.40, and Train No. 5 leaves Colon at 10.25 o'clock week day mornings instead of at 10.30 a. m.

Gatun Dam Spillway.

The concrete work in the Spillway of Gatun Dam is over 80 per cent completed, 182,102 cubic yards, out of a total of 225,000, having been placed at the close of work on February 17. A statement of the amount laid each working day last week, and of the total in place, follows:

DATE.	Concrete Laid.	Hours worked	No. Mixers.
February 12	368	15.00	2
February 13	500	16.00	2
February 14	496	16.00	2
February 15	516	16.00	2
February 16	388	16.00	2
February 17	374	12.30	2
Total	2,642	91.30	2
Previously reported	179,460		
Grand total	182,102		

Porto Bello Crusher.

A statement of the work done at the Porto Bello crusher, by days, for the week ending February 17, follows:

DATE.	Hours worked.	Cubic Yards.
February 12	2.05	1,240
February 13	3.40	2,100
February 14	3.20	1,495
February 15	4.50	2,234
February 16	2.50	1,398
February 17	3.05	1,729
Total	19.50	10,196

Ancon Crusher.

A statement of the rock crushed at Ancon quarry during the week ending February 17, follows:

DATE.	Hours worked.	Cubic Yards.
February 12	5.55	2,336
February 13	6.10	2,359
February 14	4.00	1,036
February 15	6.40	2,055
February 16	7.30	3,070
February 17	7.25	2,471
Total	37.40	13,327

To Clean Out Colon Trunk Sewer.

A requisition has beeen placed in the States for a pump to be used in cleaning out the D Street sewer in Colon, which, on account of the slight fall between the summit and the point where it discharges into the bay, is likely to become clogged. The pump will be an electrically driven, single stage, horizontal, centrifugal pump, direct connected to an induction motor, both mounted upon a cast iron base which in turn will be mounted upon a four-wheel, four-horse truck, in order that it may easily be moved from place to place. The material to be pumped will be sea water containing foreign matter such as coral sand, waste, pieces of clothing, street sweepings, pieces of wood, etc., screened down to approximately 5 by 5 inches; weight of fluid about 66 pounds per cubic foot. The pump must have a capacity of 4,000 gallons per minute against a total head of 42 feet, suction diameter 14 inches, discharge 12 inches.

Missing Men.

Any one having information regarding the whereabouts of Bennett Gordon Talley of Tennessee, who is supposed to be on the Isthmus, is requested to communicate with the American Legation, Panama.

The American Legation in Panama desires information concerning the whereabouts of Alfred J. Lodo.

CONCRETE WORK IN THE LOCKS.

Over 78 per cent of the concrete for the locks is in place, the amount at the close of work on February 17 being 3,308,114½ cubic yards, out of a total of approximately 4,199,400. A total of 23,648½ cubic yards of concrete was laid in the locks during the week ending February 17.

GATUN LOCKS.

Over 90 per cent of the concrete for the system of three twin locks at Gatun has been laid, thea mount in place at the close of work on February 17 being 1,814,710½ cubic yards, out of a total of 2,000,000. A statement of the amount of concrete placed in the locks each working day for the week ending February 17, and of the total, follows; and a similar statement for the work in the spillway at Gatun Dam is published elsewhere in this issue.

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT. 2-cubic yard mixers.			Large stone	Total.

Grand total	....	....	......	....	....	......	....	1,814,710½

The 371½ yards shown for the portable mixers (of which 281½ are reinforced concrete) were placed on the following days: February 12th, 93½; February 13th, 57; February 14th, 51½; February 15th, 54½; February 16th, 35; February 17th, 80.

PEDRO MIGUEL LOCK.

Concrete work in the lock at Pedro Miguel is over 97 per cent completed, 813,985 cubic yards, out of a total of 837,400, bucket measurement, having been placed at the close of work on February 17. The record for each of the six 8-hour working days of last week, follows:

DATE.	AUXILIARY PLANT.						Large stone.	Total
	2-cubic yard mixers.			½-cubic yard mixers.

MIRAFLORES LOCKS.

Over 49 per cent of the concrete for the system of two twin locks at Miraflores was in place on February 17, the total amount on that date being 679,419 cubic yards, bucket measurement, out of a total of approximately 1,362,000. The record for each of the six 8-hour working days of last week, follows:

DATE.	CONSTRUCTION PLANT. 2-cubic yard mixers.			AUXILIARY PLANT.							Total.

SOCIAL LIFE OF THE ZONE.

Women's Clubs.

The Executive Board of the Canal Zone Federation of Woman's Clubs met at Gorgona on Friday, February 9. Mrs. C. H. Stoddard of Gatun was made first vice-president, vice Mrs. E. H. Colip, resigned; Mrs. A. O. Herman of Gorgona, second vice-president; and Mrs. Henry Ropes Trask of Culebra, third vice-president. The board authorized a revision of the Federation by-laws in order to admit a class of individual members, or what will be known as general members. This class of members will be composed of women residing in Canal Zone villages where there are no federated clubs. General members will have all the rights and privileges of regular members; they may hold office, vote on all questions and act on any Federation committees. The annual dues for such members will be one dollar, payable at the time of admittance to membership. A membership committee was appointed, composed of the president and the two secretaries. Any woman wishing to become a general member, who is endorsed by club women, should communicate with the corresponding secretary, Mrs. Thomas E. Brown, Jr., of Cristobal.

In connection with the Federation fund for the education of the native blind boy, the board appointed a central committee composed of Mrs. Trask, Mrs. S. E. Calvit of Gorgona and Mrs. Herman. The object of this committee is to centralize the efforts of the clubs in raising the $300 pledged, and to avoid duplication of efforts. The committee is ready to advise with club presidents at any time, and would be glad to receive reports of the work. All funds intended for this purpose should be forwarded to the treasurer, Central Committee, Mrs. Calvit, Gorgona. Communications regarding the Federation pins should be addressed to the Federation treasurer, Mrs. J. E. Westberg, Empire.

Owing to the holiday on February 22 the regular meeting of the Ancon Study Club for this week will be suspended. The members of the club will go to Culebra on Friday, February 23, for the purpose of inspecting the Canal models in the office of the Chairman, and to view the Cut from the new observation platform at the point behind the Commission clubhouse. The next meeting will be on February 29. The month's program on Panama will be closed with a paper on the history of the Panama railroad. At the meeting on February 15, held at the home of Mrs. White, Ancon, a paper on the American occupation was read by Mrs. White, and one on the sanitation of the Canal Zone by Mrs. J. C. Crawford.

Church Work.

The Altar Guild of St. Luke's Chapel, Ancon, will hold weekly meetings during Lent, beginning on February 27. The meetings will be held at the home of Mrs. J. P. Fyffe every Tuesday at 9.30 o'clock. They will be devoted to reading and sewing, according to the usual custom. The afternoon meetings will be suspended until after Easter Mrs. H. C. Hanson resigned as treasurer and Mrs. Charles W. Barber was elected to fill her place. The next meeting of the guild will be at the home of Mrs. Charles F. Mason on Tuesday, February 20, at 3.30 p. m.

On Ash Wednesday, February 21, there willbe a service in St. Luke's Chapel at 9 a. m., and during Lent there will be services in the church on Wednesday and Friday mornings at the same hour.

The upper story of the public school building at Culebra has been remodelled and assigned to the Union Church for the purpose of holding religious services. Sunday school is at the usual hour, 9.30 a. m., and preaching service, with the Rev. A. A. Nellis in charge, in the evening at 7.45.

The Woman's Foreign Missionary Society of the Methodist Episcopal Church at Panama will hold its next meeting in the Sunday school room in the public school building at Culebra. The members of the society who reside in Culebra will be the hostesses.

The pupils of the Methodist Episcopal school at Balboa held a sale and entertainment in the mess hall on Wednesday, February 14. About $40 was raised. The Isthmian Sunday School Association has presented the organ purchased for the Sunday school at Tabernilla to the Balboa Sunday school. There are 30 pupils in the school, which was organized by Miss Keyser in August, 1911.

At the Gatun Union Church patriotic exercises were held on Sunday, February 18. There were three ten minute addresses: "Washington as a Soldier," by Dr. E. I. Vaughan; "Washington as a Statesman," by Mr. C. C. Carr, and "Washington as a Citizen," by Mr. W. C. Geyer. On Sunday evening, February 24, a memorial service will be held under the auspices of the veterans of the Spanish war.

Cristobal Union Church.

On Saturday evening, February 17, the Cristobal Union Church held its annual banquet at the Washington Hotel. Covers were laid for 125 persons. Mr. J. A. Smith was the toastmaster. This is the fourth annual banquet that the church has held. The church was organized in 1907, and reorganized a year later. The present pastor, the Rev. Carl H. Elliott, was appointed in January, 1909.

The new church building was dedicated on Sunday evening, February 18, the speakers for the exercises being Col. William L. Sibert, Dr. C. C. Pierce, and the Rev. J. C. Elliott. The Rev. Harry Compton, pastor of the Methodist Episcopal Church at Panama, preached the dedication sermon On Sunday, February 25, the Sunday School will hold its first session in the new church. The building as reconstructed consists of an auditorium, thirty-five by thirty-six feet, with a seating capacity of about 300, a small room at the back for the primary class, and a study for the pastor.

A Baby Show.

Forty babies, between the ages of six months and two years, were exhibited at the Commission chapel, Gatun, under the auspices of the Gatun Sunshine Society on Wednesday afternoon, February 14. Votes were sold and prizes were awarded in three classes as follows: 1st class, between one and two years, William Wells; 2nd class, six months to one year, William Rogers; under six months, Charlie Decker. During the afternoon punch and cakes were sold. The entertainment netted nearly $50, which will be forwarded to international headquarters in New York for the blind babies' work.

Panama Canal Service Medal Association.

The annual meeting of the Panama Canal Service Medal Association will be held in the hall over the Quartermaster's Office, Gorgona, at 11.30 a. m., March 3. All members are requested to be present.

United Spanish War Veterans.

A regular meeting of Camp Chagres No. 2, U. S. W. V. will be held in the I. C. C. Lodge Hall, Empire, at 2.30 p. m., Sunday, February 25. Several recruits are to be mustered in. Refreshments will be served.

Sight-Seeing Trains.

The schedule for the sight-seeing train is as follows:

Monday, Wednesday, Thursday, and Saturday trip through Culebra Cut and Pacific Division—Train leaves Panama railroad station at 7 a. m., goes through Culebra Cut, then to Culebra where opportunity will be given to see the work from the Observation Platform and to view the lock models in the Administration Building. Lunch will be served to tourists at 12.45 o'clock at the Commission hotel. Persons wishing to go to Colon may take the train that arrives at Culebra at 11.30 a. m., and to Panama, that which arrives at 12 19 p. m.

The train will leave Culebra station at 1.30 p. m. for the trip to Pedro Miguel Locks, Miraflores Locks, and Dam, and the Pacific entrance, returning to Panama in time to allow passengers to take the 5.25 p. m. train for Colon. Persons wishing to make the trip over the Pacific Division only should take the regular passenger train from Panama at 10.55 a. m., getting off at Pedro Miguel where they can obtain lunch at the Commission hotel. The sight-seeing train leaves the station at 2 p. m.

Tuesday and Friday, Gatun Locks and Dam—The train will leave Colon at 8 a. m. and 1 p. m., making two trips, the departure from Gatun station for the tour over the locks and dam being made at 8.40 a. m., and 1.30 p. m. After the completion of the afternoon trip the train will go direct to Panama. Persons wishing to take the Atlantic Division trip from Panama must go to Gatun by one of the morning trains leaving Panama at 6.35 and 10.55 o'clock respectively. These trains arrive at Gatun at 8.41 a. m., and 1.00 p. m. respectively.

Regular fare will be charged between Panama and Pedro Miguel, Colon and Gatun, and Gatun and Panama; and one dollar extra will be charged for the trip over each division.

PERSONAL.

The Hon. W. L. Fisher, Secretary of the Interior, and a party of friends will arrive on the Isthmus from New York on Thursday, February 22. Postmaster General Hitchcock, who was expected to accompany them, was unable to do so.

Baron Hengelmuller, Austrian Ambassador to the United States, and Captain de Chambrun, Military Attache of the French Embassy at Washington, each with a party, will arrive from New Orleans on February 22.

Porto Bello Chess Club.

The result of the handicap tournament played in December and January follows: Prize—Set Staunton chessmen, presented by C. D. Morgan, won by R. C. Goodfellow. Score—Goodfellow, .875 per cent; Hanbury, .792; Poole, .693; Morgan, C. D., .666; Tuttle, .625; Wright, .571; Rogers, .571; Corrigan, .500; Snider, .455; Schreiber, .444; McDevitt, .409; Morgan, C. W., .385; Colberg, .227; Mackintosh, .154 per cent.

PUMPS AND MOTORS.

Drainage of Lock Sumps and Operation of Chain Fenders.

A requisition has been made in order that bids may be requested for motors, pumps, and float switches and pump motor starters for the locks, in accordance with the following schedule:

Class 1. Motors—Eighteen motors for guard valve machines; 80 motors for hand-rail mechanism with 80 hand-rail gearings; 22 motors for spillway gate machines.

Class 2. Pumps—Forty-eight pumps for chain fender machines with 48 direct-connected motors; 48 pumps for sumps at bottom of chain fender pit with 48 motors; 92 pumps for sump at bottom of miter gates with 92 motors; 9 pumps for drainage sump with 9 motors; 3 pumps for main culvert, 3 motors; 7 portable pumps for machinery and cable pits with 7 motors; total 207, pumps and motors

Class 3. Float Switches and Pump Motor Starters—Forty-eight float switches for chain fender sumps; 92 float switches for miter gate sumps; 9 float switches for drainage sumps; 48 starters for chain fender sump pumps; 92 starters for miter gate sump pumps; 9 starters for drainage sump pumps; 3 compensators for culvert pumps; 7 compensators for pit pumps. Total of 149 float switches, 149 automatic starters and 10 compensators.

It is proposed to purchase two motor-driven pumps for chain fender machines and to test them thoroughly on the Isthmus, after which the remaining 46 will be purchased, the result of the tests determining largely the manufacturer from whom they will be purchased. Alternative bids covering eight portable pumps are called for in lieu of the 92 bilge pumps for the miter gate sumps. In case the alternative is accepted, the portables would be moved periodically from gate to gate.

MOTORS.

All motors are to be of the induction, mill type, possessing a high-torque, squirrel-cage winding, arranged to operate upon a 3-phase, 25-cycle, 220-volt system. The motors are to be totally inclosed and moisture-proof, similar in all respects to motors previously specified for other motors to drive the lock machinery; the rating is to be standard and such that an overload of 25 per cent may be carried for ten minutes without injurious heating and a 100 per cent overload may be carried momentarily; the pump motors are to operate in emergency for short periods either under water or partially submerged from wave wash. The motors for the lock machinery are to be of the horizontal type, whereas the majority of the pump motors are to be of the vertical type.

Guard Valve Motors—The guard valve machines are designed to operate the valves that guard the intakes of the side wall culverts at the upper end of each flight of locks. These valves proper are similar to the rising-stem gate type used elsewhere in the main supply culverts, but the machines are somewhat different from those used in operating the other gate valves. The 18 motors required for running the machines are to be rated at a full-load speed of 460 r. p. m. (synchronous, 500 r. p. m.) and a full-load torque of not less than 295 pound-feet.

Hand Rail Motors—Thesh motors ara required to furnish the motive power for raising and lowering the hand-rails of the footwalk across the tops of the miter gates. These walks provide a passageway for crossing the locks when the gates are closed, and the hand-rail guards the passage. When the gates are opened and in their recesses in the lock walls, the hand-rails, if allowed to, would extend above the level of the top of the lock wall and interfere with the movement of the towing line. A mechanism has therefore been devised, and interlocked with the miter gate moving machine, by which the hand-rail will be automatically lowered when the gate is opened, and raised when the gate is closed. The motors for this machine are to be rated at a full-load speed of 625 r. p. m. (synchronous, 750 r. p. m.) and a full-load torque of not less that 63 pound-feet.

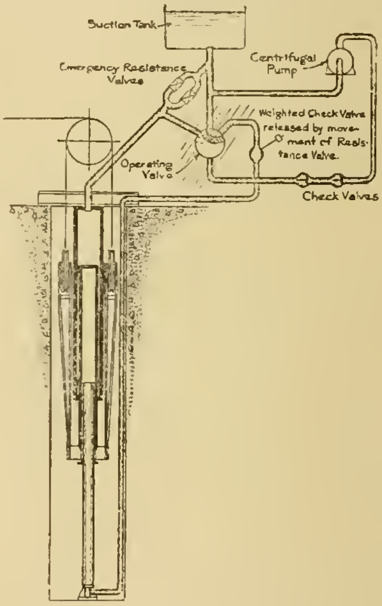
Spillway Gate Motors—The motors for the spillway gate machines are to operate the crest gates that will be mounted upon the top of the spillway dams at Gatun and Miraflores —14 at the former and 8 at the latter place. The operation of the spillway gates is described in THE CANAL RECORD of October 25, 1911. The motor is direct-connected to a long shaft provided with worms at both ends. Through the center of the two meshing worm-wheels, are screw stems which carry heavy counterweights. When the motor is operated the screw stems and counterweights are either raised or lowered To the upper end of each screw stem is attached a chain which rides over an idler at the top of the concrete pier, and the spillway gate is suspended from the outside ends of the two chains. The rating of these motors is the same as that for the hand-rail mechanism motors.

MOTOR-DRIVEN CENTRIFUGAL PUMPS

The pumps are required for two general classes of work; first to supply water for the hydraulic operation of the fender chain machines, and secondly to unwater various sumps in the locks. In all, there will be required 207 (or 123) pumps, according to whether or not the alternative proposal upon sump pumps for the miter gates is accepted. In general the pumps will be of two classes—horizontal and vertical—and will be of either the volute or turbine centrifugal type, preferably single-stage, as may be best suited to the work they have to perform. Pumps of various capacity and for various duties are required, but if practicable the smaller-sized pumps are to be made identical, particularly in respect to the size and rating of the driving motor. Parts entering into the construction of pumps of the same style and capacity are to be interchangeable. Having in view the character of the work to be performed, the pumps must be designed and manufactured with a view of operating successfully under adverse climatic and installation conditions.

Consideration—The proportions and shapes of water passages, impellers, vanes, outlets, and bearings are to be carefully determined. Extreme care must be used in the design of water passages and cross sections; rapid changes of velocity will not be allowed. Most of the pumps will handle the fresh water of Gatun Lake with average temperature of 80 to 85 degrees Fahrenheit, but the sump pumps at the lower ends of the locks will handle water that has been mixed with the sea water of the lower channel, and is therefore saline, having a specific gravity of approximately 1.025.

Chain Fender Pumps—The duty of the pumps required for the chain fender machines is explained in an article on the chain fenders that appeared in THE CANAL RECORD of October 4, 1911. These fender chains are stretched across the lock chambers in front of certain miter gates for the purpose of preventing a ship that might become unmanageable from ramming the gates. The chains are lowered into a well in the floor of the lock chamber whenever it is desired to allow a ship to pass. The mechanism for lifting and lowering the chain consists of a fixed plunger operating within a cylinder which in turn operates within another cylinder, the resulting movement either up or down, actuating the chain which, by a system of pulleys, is given a movement of 4 feet for every foot of movement in the cylinders. The intermediate cylinder is moved downward by introducing water under pressure to the top of the outer cylinder. This change of flow is produced by varying the position of a specially designed operating valve by means of a remotely controlled solenoid device. A resistance valve provides for the gradual release of the chain if struck by a vessel. In lowering the chain the pump is required to work against a pressure varying from zero at starting with a rapid rise driving first foot of plunger stroke to a full-load of 130 pounds per square inch, which pressure is maintained within comparatively narrow limits throughout the entire stroke. The total quantity of water required to be delivered under these circumstances is 550 gallons for the maximum length of operating stroke of 21 feet 6 inches, and 350 gallons for the minimum stroke of 13 feet 6 inches. The maximum time allowed for either lowering or raising chain is one minute. In raising the chain, the total quantity of water to be pumped for the maximum stroke of 21 feet 6 inches is 1,260 gallons, and for the minimum stroke of 13 feet 6 inches, 800 gallons, both capacities being pumped at reduced pressures. The varying duty cycle occasioned by broad differences in pressure and water discharge occasioned by friction, the weight of the water displaced when the chain is immersed, and the full weight of the chain when free of the water, as well as the difference between raising and lowering the chain, must be met by the pump without overloading the motor.



Suction Tank
Centrifugal Pump
Emergency Resistance Valves
Weighted Check Valve released by movement of Resistance Valve.
Operating Valve
Check Valves

GENERAL LAYOUT OF FENDER CHAIN OPERATING MACHINERY.

Chain Fender Sump Pumps—The pit in which the chain fender machine is contained will be subjected to an accumulation of bilge from drippings of the chain as it enters the pit, leak from the cylinders, slight wave wash through the hawse pipe, and drainage from the machine room floor. The sump pumps to drain the pit will be of the standard vertical centrifugal type with the motor mounted above and directly connected to the pump. The pump motor will be automatically controlled by means of a float switch, which will throw the motor into operation whenever the level of the bilge in the sump rises to the level of approximately one inch below the top of the sump that is one inch below the level of the floor of the pit.

Miter Gate Sump Pumps—The miter gates are built up of steel girders covered with steel sheathing, bulkheaded vertically to form four independent compartments approximately 7 feet wide at the center of the gate leaf. In order to maintain watertight compartments in each of the leaves it has been necessary to lay out a drainage system that prevents communication between the compartments. It is not expected that any extensive bilge will collect in these compartments, unless the sheathing proves to be exceptionally leaky. The first proposal is for pumps of the vertical, motor-driven, centrifugal, stationary type, multi-stage if necessary. but preferably single-stage, mounted at the bottom of the gate and permanently connected to a horizontal suction pipe, which pipe inter-connects the vertical compartments. Ordinarily these pumps will be manually controlled from the top of the gate leaf and the bilge will be emptied at fixed intervals. Automatic operation by means of a float switch located alongside the motor is provided in case the water in the compartment which contains the pump accidentally reaches the pump motor. These pumps will have a suction and a discharge of 2 inches in diameter, will operate against a maximum head of approximately 90 feet and a minimum of 47 feet, and must have a minimum discharge capacity at maximum head of 75 gallons of water per minute.

An alternative proposal for pumping with portable pumps will be considered. The portable pump unit would be of a self-contained type which is capable of being transported upon a wheeled carriage from point to point on top of the lock walls. The pump is to be motor-driven and provided with a lifting ring by means of which the entire unit can be lowered with a crane (or other special hoisting device) through the mainshaft down to the level of the bilge at the bottom of the gate leaf. Portable pumps permit of discharging the accumulations of especially leaky gates (which should be a small percentage to the total number of gates), without the necessity of investing in 92 fixed pumps for all the gate leaves, the majority of fixed pumps operating at very rare intervals.

Pumps for Lowering Drainage Sump—At the lower end of each lock, under the arches, there is a small area of the lock drainage system which is below the surface of the water in the lower channel, and it is necessary to pump the bilge that accumulates here, which bilge is chiefly wave wash, through the miter gate room openings. This will be done by a pump which will automatically clear the sump of bilge. This pump will be of the vertical, motor-driven, single-stage, centrifugal, stationary type, fixed in the concrete sump, and will be submerged without priming connections. The motor will be of the vertical induction type, and will be controlled by a starter which is automatically actuated by a float switch. The pump will have a suction 6 inches in diameter, a discharge 5 inches, a maximum head of 15 feet, a minimum head of 11 feet 6 inches, and a minimum discharge at maximum head of 800 gallons per minute.

Pumps for Center Wall Culverts—A description of the method of controlling the flow of water from the center wall culverts into the lock chambers was published in THE CANAL RECORD of November 15, 1911. It will be desirable at intervals to unwater the center wall culvert in order to make repairs to the cylindrical valves, and to accomplish this unwatering the discharge openings will be bulkheaded off and the culvert pumped dry. One vertical, semi-portable pump arranged with bails for suspension from a lift-line will be required for each of the locks. The pump and motor will be mounted compactly together In the usual operation the lock chamber will be unwatered, leaving the water in the culvert approximately 25 feet deep, the maximum depth being about 62 feet. The pump will be lowered into the water step by step until the culvert is pumped dry, the whole operation requiring about eight to ten hours. These pumps will have a suction diameter of 15 inches, a discharge of 12 inches, a maximum head of 70 feet, a minimum head of 10 feet, and a minimum discharge at maximum head of 4,200 gallons a minute.

Pumps for Deep Pits and Shafts—Throughout the entire length of all the locks certain deep machinery pits and cable shafts have been installed, and on account of the small amount of bilge that will probably collect at the bottom it is not necessary to equip each pit and shaft with separate pumps. Portable pumps are therefore provided to unwater them. These pumps will operate against widely divergent heads varying from a few feet to 100 feet. The portable unit will be mounted upon a wheeled carriage to facilitate movement from place to place, and will be fitted with bails to permit lifting by locomotive crane into pumping position. These pumps will have either a 3 or $3\frac{1}{2}$-inch suction, a $2\frac{1}{2}$ or 3-inch discharge, maximum head of 100 feet, a minimum head of 10 feet, and a minimum discharge at maximum head of 100 gallons per minute.

Float Switches—As has been indicated above, the chain fender sumps, miter gate sumps, and drainage sumps are to be automatically controlled, depending upon the level of the bilge in the sump. The automatic operation is to be performed by means of a float and quick-break switch, which device will throw the motor into operation as the water reaches a certain predetermined level in the sump, and throw the motor out again when the bilge has been discharged. The mechanism for operating the quick-break switch will consist of a copper float attached to a chain which rides over a couple of pulleys, the float being counter-weighted. The chain is supplied with lugs to engage an arm on the quick-break switch, which arm actuates the switch. The starters to operate in connection with the quick-break switches will be of the double-pole type for making and breaking the circuit to a three-phase motor, and are very similar to the contactors described in the article published in THE CANAL RECORD of February 7, 1912.

EXECUTIVE ORDER.

To Provide an Inexpensive Method for the Administration of Estates of Deceased and Insane Persons in Certain Cases, and to Repeal Act 24, of the Canal Zone Laws, and the Executive Order Amendatory Thereto.

By virtue of the authority invested in me, I hereby establish the following Executive Order for the Canal Zone:

Section 1. Whenever an employe in the service of the Isthmian Canal Commission, or the Government of the Canal Zone, or of the Panama Railroad Company, shall die, leaving an estate in the said Zone, or whenever such decedent, being a citizen of the United States, leaves an estate in the Canal Zone or in the Republic of Panama; and the said estate consists of personal property only, not exceeding in value the sum of $1,000.00, and a regular administration shall not have been instituted in the courts of the Canal Zone, the Collector of Revenues for the Canal Zone is hereby authorized and directed to take possession of the estate of the said deceased person and to make a complete inventory thereof and present the same to the Judge of the Circuit Court of the First Judicial Circuit of the Canal Zone, to be filed by the said judge in the records of his court when approved by him.

Section 2. The Collector of Revenues, with the approval of the Judge of the Circuit Court of the First Judicial Circuit, out of the assets of the estate, may pay the burial expenses of the said deceased person and all expenses necessarily incurred in securing possession of the estate and of administering the same until it is turned over to the heirs or other parties entitled thereto, and he may also pay the expenses of the transportation of the remains of the decedent to the United States, if he is an American Citizen and such transportation is desired by the surviving relatives. He shall also pay the lawful debts of the deceased, with the approval of the Circuit Judge.

Section 3. In case the deceased shall have to his credit with the Isthmian Canal Commission, the Government of the Canal Zone, or the Panama Railroad Company, any sum as salary or other acknowledged claim, the amount so due shall be paid to the Collector of Revenues and be by him administered as a part of said estate in the manner prescribed by this Order; *Provided*, that if there should be a regular administration upon the estate of the deceased in a court of competent jurisdiction in the Canal Zone, then the sum due to the deceased shall be paid to the regular executor or administrator of the estate appointed by said court.

Section 4. After all of the expenses connected with the burial of the deceased person and in securing possession of the estate and in otherwise administering the same, together with the lawful debts of the deceased, have been fully paid, the balance of such estate shall be paid by the Collector of Revenues to the parties entitled to receive such estate; but before making such payment, the approval of the Judge of the Circuit Court must be obtained.

Section 5. If the deceased employe is an alien and has no heirs in the Canal Zone, the Collector of Revenues is hereby authorized and directed to deliver the residue of the decedent's estate to the diplomatic or consular representative of the country of which the decedent was a citizen or subject accredited to the Rebpulic of Panama, to be delivered by such representative to the heirs of the decedent; if the deceased is a citizen of Panama, the residue of the estate may be delivered to his heirs in Panama, or to the authorities designated for that purpose by the Panamanian laws or decrees.

Section 6. After the estate has been fully administered by the Collector of Revenues and the residue thereof has been turned over to the parties entitled to the same according to this Order, the Collector of Revenues shall file a final report of his acts and doings in the estate with the Judge of the Circuit Court, and accompany said report with the proper vouchers and other supporting papers, showing the receipts and disbursements made by him in administering the estate, and the Circuit Judge shall examine said report, and if he finds it correct, he shall approve the same and discharge the Collector of Revenues as such administrator.

Section 7. If the decedent should leave a widow, or minor children, or dependent relative, in necessitous circumstances to be determined by the Circuit Judge, the residue of the estate of the decedent, after all of the funeral expenses, the expenses of transportation of the remains of the deceased to the United States, if the remains are transported, and the other expenses incident to the administration of the estate are fully paid, shall be delivered to said widow, or minor children, or dependent relative, as the case may be, for their maintenance and support; and, except as in this section otherwise provided, the claims of the widow, minor children, or dependent relative of the deceased for this allowance shall be superior to the claims of the creditors of the deceased; *provided*, that such preference in favor of the widow, minor children, or dependent relative shall not exceed $500.00.
